Chapter 1

Introduction

1.1 Scope

IEEE Std 1003.1-200x defines a standard operating system interface and environment, including a command interpreter (or ‘‘shell’’), and common utility programs to support applications portability at the source code level. It is intended to be used by both applications developers and system implementors.

IEEE Std 1003.1-200x comprises four major components (each in an associated volume):

1. General terms, concepts, and interfaces common to all volumes of IEEE Std 1003.1-200x, including utility conventions and C language header definitions, are included in the Base Definitions volume of IEEE Std 1003.1-200x.
2. Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume of IEEE Std 1003.1-200x.
3. Definitions for a standard source code-level interface to command interpretation services (a ‘‘shell’’) and common utility programs for application programs are included in the Shell and Utilities volume of IEEE Std 1003.1-200x.
4. Extended rationale that did not fit well into the rest of the document structure, containing historical information concerning the contents of IEEE Std 1003.1-200x and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume of IEEE Std 1003.1-200x.

The following areas are outside of the scope of IEEE Std 1003.1-200x:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

IEEE Std 1003.1-200x describes the external characteristics and facilities that are of importance to applications developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

The facilities provided in IEEE Std 1003.1-200x are drawn from the following base documents:

- IEEE Std 1003.1-1996 (POSIX-1) (incorporating IEEE Stds. 1003.1-1990, 1003.1b-1993, 1003.1c-1995, and 1003.1i-1995)
- The following amendments to the POSIX.1-1990 standard:
  - — IEEE P1003.1a draft standard (Additional System Services)
  - — IEEE Std 1003.1d-1999 (Additional Realtime Extensions)

  - — IEEE Std 1003.1g-2000 (Protocol-Independent Interfaces (PII))
  - — IEEE Std 1003.1j-2000 (Advanced Realtime Extensions)
  - — IEEE Std 1003.1q-2000 (Tracing)
- IEEE Std 1003.2-1992 (POSIX-2) (includes IEEE Std 1003.2a-1992)
- The following amendments to the ISO POSIX-2: 1993 standard:
  - — IEEE P1003.2b draft standard (Additional Utilities)
  - — IEEE Std 1003.2d-1994 (Batch Environment)
- Open Group Technical Standard, February 1997, System Interface Definitions, Issue 5 (XBD5) (ISBN: 1-85912-186-1, C605)
- Open Group Technical Standard, February 1997, Commands and Utilities, Issue 5 (XCU5) (ISBN: 1-85912-191-8, C604)
- Open Group Technical Standard, February 1997, System Interfaces and Headers, Issue 5 (XSH5) (in 2 Volumes) (ISBN: 1-85912-181-0, C606)

  Note: XBD5, XCU5, and XSH5 are collectively referred to as the *Base Specifications*.

- Open Group Technical Standard, January 2000, Networking Services, Issue 5.2 (XNS5.2) (ISBN: 1-85912-241-8, C808)
- ISO / IEC 9899: 1999, Programming Languages — C.

IEEE Std 1003.1-200x uses the *Base Specifications* as its organizational basis and adds the following additional functionality to them drawn from the base documents above:

- Normative text from the ISO POSIX-1: 1996 standard and the ISO POSIX-2: 1993 standard not included in the *Base Specifications*
- The amendments to the POSIX.1-1990 standard and the ISO POSIX-2: 1993 standard listed above, except for parts of IEEE Std 1003.1g-2000
- Portability Considerations
- Additional rationale and notes

The following features, marked legacy or obsolescent in the base documents, are not carried forward into IEEE Std 1003.1-200x. Other features from the base documents marked legacy or obsolescent are carried forward unless otherwise noted.

From XSH5, the following legacy interfaces, headers, and external variables are not carried forward:

> *advance*( ), *brk*( ), *chroot*( ), *compile*( ), *cuserid*( ), *gamma*( ), *getdtablesize*( ), *getpagesize*( ), *getpass*( ), *getw*( ), *putw*( ), *re_comp*( ), *re_exec*( ), *regcmp*( ), *sbrk*( ), *sigstack*( ), *step*( ), *wait3*( ), **<re_comp.h>**, **<regexp.h>**, **<varargs.h>**, *loc1*, *__loc1*, *loc2*, *locs*

From XCU5, the following legacy utilities are not carried forward:

> *calendar*, *cancel*, *cc*, *col*, *cpio*, *cu*, *dircmp*, *dis*, *egrep*, *fgrep*, *line*, *lint*, *lpstat*, *mail*, *pack*, *pcat*, *pg*, *spell*, *sum*, *tar*, *unpack*, *uulog*, *uuname*, *uupick*, *uuto*

In addition, legacy features within non-legacy reference pages (for example, headers) are not carried forward.

From the ISO POSIX-1: 1996 standard, the following obsolescent features are not carried forward:

Page 112, CLK_TCK
Page 197 *tcgetattr*( ) rate returned option

From the ISO POSIX-2: 1993 standard, obsolescent features within the following pages are not carried forward:

Page 75, zero-length prefix within PATH
Page 156, 159 *set*
Page 178, *awk*, use of no argument and no parentheses with length
Page 259, *ed*
Page 272, *env*
Page 282, *find* −**perm**[−]*onum*
Page 295-296, *egrep*
Page 299-300, *head*
Page 305-306, *join*
Page 309-310, *kill*
Page 431-433, 435-436, *sort*
Page 444-445, *tail*
Page 453, 455-456, *touch*
Page 464-465, *tty*
Page 472, *uniq*
Page 515-516, *ex*
Page 542-543, *expand*
Page 563-565, *more*
Page 574-576, *newgrp*
Page 578, *nice*
Page 594-596, *renice*
Page 597-598, *split*
Page 600-601, *strings*
Page 624-625, *vi*
Page 693, *lex*

The *c89* utility (which specified a compiler for the C Language specified by the ISO / IEC 9899: 1990 standard) has been replaced by a *c99* utility (which specifies a compiler for the C Language specified by the ISO / IEC 9899: 1999 standard).

From XSH5, text marked OH (Optional Header) has been reviewed on a case-by-case basis and removed where appropriate. The XCU5 text marked OF (Output Format Incompletely Specified) and UN (Possibly Unsupportable Feature) has been reviewed on a case-by-case basis and removed where appropriate |

For the networking interfaces, the base document is the XNS, Issue 5.2 specification. The following parts of the XNS, Issue 5.2 specification are out of scope and not included in IEEE Std 1003.1-200x:

- Part 3 (XTI)
- Part 4 (Appendixes)

Since there is much duplication between the XNS, Issue 5.2 specification and IEEE Std 1003.1g-2000, material only from the following sections of IEEE Std 1003.1g-2000 has been included:

- General terms related to sockets (2.2.2)
- Socket concepts (5.1 through 5.3, inclusive)

- The *pselect*( ) function (6.2.2.1 and 6.2.3)
- The **<sys/select.h>** header (6.2)

Emphasis is placed on standardizing existing practice for existing users, with changes and additions limited to correcting deficiencies in the following areas:

- Issues raised by IEEE or ISO / IEC Interpretations against IEEE Std 1003.1 and IEEE Std 1003.2
- Issues raised in corrigenda for the *Base Specifications* and working group resolutions from The Open Group
- Corrigenda and resolutions passed by The Open Group for the XNS, Issue 5.2 specification
- Changes to make the text self-consistent with the additional material merged
- A reorganization of the options in order to facilitate profiling, both for smaller profiles such as IEEE Std 1003.13, and larger profiles such as the Single UNIX Specification
- Alignment with the ISO / IEC 9899: 1999 standard

1.2 Conformance

Conformance requirements for IEEE Std 1003.1-200x are defined in Chapter 2 (on page 15).

1.3 Normative References

The following standards contain provisions which, through references in IEEE Std 1003.1-200x, constitute provisions of IEEE Std 1003.1-200x. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on IEEE Std 1003.1-200x are encouraged to investigate the possibility of applying the most recent editions of the standards listed below. Members of IEC and ISO maintain registers of currently valid International Standards.

ANS X3.9-1978

(Reaffirmed 1989) American National Standard for Information Systems: Standard X3.9-1978, Programming Language FORTRAN.[1]

ISO / IEC 646: 1991

ISO / IEC 646: 1991, Information Processing — ISO 7-bit Coded Character Set for Information Interchange.[2]

The reference version of the standard contains 95 graphic characters, which are identical to the graphic characters defined in the ASCII coded character set.

ISO 4217: 1995

ISO 4217: 1995, Codes for the Representation of Currencies and Funds. |

2. ISO/IEC documents can be obtained from the ISO office: 1 Rue de Varembé, Case Postale 56, CH-1211, Genève 20, Switzerland / Suisse

ISO 8601: 2000

ISO 8601: 2000, Data Elements and Interchange Formats — Information Interchange — Representation of Dates and Times.

ISO C (1999)

ISO / IEC 9899: 1999, Programming Languages — C, including Technical Corrigendum No. 1.

ISO / IEC 10646-1: 2000

ISO / IEC 10646-1: 2000, Information Technology — Universal Multiple-Octet Coded Character Set (UCS) — Part 1: Architecture and Basic Multilingual Plane.

1.4 Terminology

For the purposes of IEEE Std 1003.1-200x, the following terminology definitions apply:

can

Describes a permissible optional feature or behavior available to the user or application. The feature or behavior is mandatory for an implementation that conforms to IEEE Std 1003.1-200x. An application can rely on the existence of the feature or behavior.

implementation-defined

Describes a value or behavior that is not defined by IEEE Std 1003.1-200x but is selected by an implementor. The value or behavior may vary among implementations that conform to IEEE Std 1003.1-200x. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations.

The implementor shall document such a value or behavior so that it can be used correctly by an application.

legacy

Describes a feature or behavior that is being retained for compatibility with older applications, but which has limitations which make it inappropriate for developing portable applications. New applications should use alternative means of obtaining equivalent functionality.

may

Describes a feature or behavior that is optional for an implementation that conforms to IEEE Std 1003.1-200x. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

To avoid ambiguity, the opposite of *may* is expressed as *need not*, instead of *may not*.

shall

For an implementation that conforms to IEEE Std 1003.1-200x, describes a feature or behavior that is mandatory. An application can rely on the existence of the feature or behavior.

For an application or user, describes a behavior that is mandatory.

should

For an implementation that conforms to IEEE Std 1003.1-200x, describes a feature or behavior that is recommended but not mandatory. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

For an application, describes a feature or behavior that is recommended programming practice for optimum portability.

undefined

Describes the nature of a value or behavior not defined by IEEE Std 1003.1-200x which results from use of an invalid program construct or invalid data input.

The value or behavior may vary among implementations that conform to IEEE Std 1003.1-200x. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

unspecified

Describes the nature of a value or behavior not specified by IEEE Std 1003.1-200x which results from use of a valid program construct or valid data input.

The value or behavior may vary among implementations that conform to IEEE Std 1003.1-200x. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

1.5 Portability

Some of the utilities in the Shell and Utilities volume of IEEE Std 1003.1-200x and functions in the System Interfaces volume of IEEE Std 1003.1-200x describe functionality that might not be fully portable to systems meeting the requirements for POSIX conformance (see the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 2, Conformance).

Where optional, enhanced, or reduced functionality is specified, the text is shaded and a code in the margin identifies the nature of the option, extension, or warning (see Section 1.5.1). For maximum portability, an application should avoid such functionality.

Unless the primary task of a utility is to produce textual material on its standard output, application developers should not rely on the format or content of any such material that may be produced. Where the primary task *is* to provide such material, but the output format is incompletely specified, the description is marked with the OF margin code and shading. Application developers are warned not to expect that the output of such an interface on one system is any guide to its behavior on another system.

1.5.1 Codes

The codes and their meanings are as follows. See also Section 1.5.2 (on page 14).

ADV Advisory Information

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the ADV margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ADV margin legend.

AIO Asynchronous Input and Output

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the AIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the AIO margin legend.

BAR **Barriers**

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the BAR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the BAR margin legend.

BE **Batch Environment Services and Utilities**

The functionality described is optional.

Where applicable, utilities are marked with the BE margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the BE margin legend.

CD **C-Language Development Utilities**

The functionality described is optional.

Where applicable, utilities are marked with the CD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the CD margin legend.

CPT **Process CPU-Time Clocks**

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the CPT margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the CPT margin legend.

CS **Clock Selection**

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the CS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the CS margin legend.

CX **Extension to the ISO C standard**

The functionality described is an extension to the ISO C standard. Application writers may make use of an extension as it is supported on all IEEE Std 1003.1-200x-conforming systems.

With each function or header from the ISO C standard, a statement to the effect that ‘‘any conflict is unintentional’’ is included. That is intended to refer to a direct conflict. IEEE Std 1003.1-200x acts in part as a profile of the ISO C standard, and it may choose to further constrain behaviors allowed to vary by the ISO C standard. Such limitations are not considered conflicts.

FD **FORTRAN Development Utilities**

The functionality described is optional.

Where applicable, utilities are marked with the FD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the FD margin legend.

FR **FORTRAN Runtime Utilities**

The functionality described is optional.

Where applicable, utilities are marked with the FR margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the FR margin legend.

FSC File Synchronization

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the FSC margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the FSC margin legend.

IP6 IPV6

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the IP6 margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the IP6 margin legend.

MC1 Advisory Information and either Memory Mapped Files or Shared Memory Objects

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

This is a shorthand notation for combinations of multiple option codes.

Where applicable, functions are marked with the MC1 margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MC1 margin legend.

Refer to Section 1.5.2 (on page 14).

MC2 Memory Mapped Files, Shared Memory Objects, or Memory Protection

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

This is a shorthand notation for combinations of multiple option codes.

Where applicable, functions are marked with the MC2 margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MC2 margin legend.

Refer to Section 1.5.2 (on page 14).

MF Memory Mapped Files

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MF margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MF margin legend.

ML Process Memory Locking

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the ML margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ML margin legend.

MLR

Range Memory Locking

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MLR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MLR margin legend.

MON

Monotonic Clock

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MON margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MON margin legend.

MPR

Memory Protection

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MPR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MPR margin legend.

MSG

Message Passing

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MSG margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MSG margin legend.

MX

IEC 60559 Floating-Point Option

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MX margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MX margin legend.

OB

Obsolescent

The functionality described may be withdrawn in a future version of this volume of IEEE Std 1003.1-200x. Strictly Conforming POSIX Applications and Strictly Conforming XSI Applications shall not use obsolescent features.

OF

Output Format Incompletely Specified

The functionality described is an XSI extension. The format of the output produced by the utility is not fully specified. It is therefore not possible to post-process this output in a consistent fashion. Typical problems include unknown length of strings and unspecified field delimiters.

OH

Optional Header

In the SYNOPSIS section of some interfaces in the System Interfaces volume of IEEE Std 1003.1-200x an included header is marked as in the following example:

OH

```
#include <sys/types.h>
#include <grp.h>
struct group *getgrnam(const char *name);
```

This indicates that the marked header is not required on XSI-conformant systems.

PIO Prioritized Input and Output

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the PIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the PIO margin legend.

PS Process Scheduling

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the PS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the PS margin legend.

RS Raw Sockets

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the RS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the RS margin legend.

RTS Realtime Signals Extension

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the RTS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the RTS margin legend.

SD Software Development Utilities

The functionality described is optional.

Where applicable, utilities are marked with the SD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the SD margin legend.

SEM Semaphores

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SEM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SEM margin legend.

SHM Shared Memory Objects

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SHM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SHM margin legend.

SIO Synchronized Input and Output

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SIO margin legend.

SPI Spin Locks

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SPI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SPI margin legend.

SPN Spawn

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SPN margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SPN margin legend.

SS Process Sporadic Server

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SS margin legend.

TCT Thread CPU-Time Clocks

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TCT margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TCT margin legend.

TEF Trace Event Filter

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TEF margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TEF margin legend.

THR Threads

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the THR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the THR margin legend.

TMO Timeouts

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TMO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TMO margin legend.

TMR

Timers

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TMR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TMR margin legend.

TPI

Thread Priority Inheritance

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPI margin legend.

TPP

Thread Priority Protection

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPP margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPP margin legend.

TPS

Thread Execution Scheduling

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPS margin legend.

TRC

Trace

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRC margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRC margin legend.

TRI

Trace Inherit

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRI margin legend.

TRL

Trace Log

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRL margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRL margin legend.

TSA

Thread Stack Address Attribute

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSA margin legend for the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSA margin legend.

TSF Thread-Safe Functions

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSF margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSF margin legend.

TSH Thread Process-Shared Synchronization

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSH margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSH margin legend.

TSP Thread Sporadic Server

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSP margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSP margin legend.

TSS Thread Stack Address Size

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSS margin legend.

TYM Typed Memory Objects

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TYM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TYM margin legend.

UP User Portability Utilities

The functionality described is optional.

Where applicable, utilities are marked with the UP margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the UP margin legend.

XSI Extension

The functionality described is an XSI extension. Functionality marked XSI is also an extension to the ISO C standard. Application writers may confidently make use of an extension on all systems supporting the X/Open System Interfaces Extension.

If an entire SYNOPSIS section is shaded and marked XSI, all the functionality described in that reference page is an extension. See Section 2.1.4 (on page 19).

XSR XSI STREAMS

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the XSR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the XSR margin legend.

1.5.2 Margin Code Notation

Some of the functionality described in IEEE Std 1003.1-200x depends on support of more than one option, or independently may depend on several options. The following notation for margin codes is used to denote the following cases.

A Feature Dependent on One or Two Options

In this case, margin codes have a <space> separator; for example:

MF This feature requires support for only the Memory Mapped Files option.

MF SHM This feature requires support for both the Memory Mapped Files and the Shared Memory Objects options; that is, an application which uses this feature is portable only between implementations that provide both options.

A Feature Dependent on Either of the Options Denoted

In this case, margin codes have a '|' separator to denote the logical OR; for example:

MF|SHM This feature is dependent on support for either the Memory Mapped Files option or the Shared Memory Objects option; that is, an application which uses this feature is portable between implementations that provide any (or all) of the options.

A Feature Dependent on More than Two Options

The following shorthand notations are used:

MC1 The MC1 margin code is shorthand for ADV (MF|SHM). Features which are shaded with this margin code require support of the Advisory Information option and either the Memory Mapped Files or Shared Memory Objects option.

MC2 The MC2 margin code is shorthand for MF|SHM|MPR. Features which are shaded with this margin code require support of either the Memory Mapped Files, Shared Memory Objects, or Memory Protection options.

Large Sections Dependent on an Option

Where large sections of text are dependent on support for an option, a lead-in text block is provided and shaded accordingly; for example:

TRC This section describes extensions to support tracing of user applications. This functionality is dependent on support of the Trace option (and the rest of this section is not further shaded for this option).

Chapter 2

Conformance

2.1 Implementation Conformance

2.1.1 Requirements

A *conforming implementation* shall meet all of the following criteria:

1. The system shall support all utilities, functions, and facilities defined within IEEE Std 1003.1-200x that are required for POSIX conformance (see Section 2.1.3 (on page 16)). These interfaces shall support the functional behavior described herein.

2. The system may support one or more options as described under Section 2.1.5 (on page 20). When an implementation claims that an option is supported, all of its constituent parts shall be provided.

3. The system may support the X/Open System Interface Extension (XSI) as described under Section 2.1.4 (on page 19).

4. The system may provide additional utilities, functions, or facilities not required by IEEE Std 1003.1-200x. Non-standard extensions of the utilities, functions, or facilities specified in IEEE Std 1003.1-200x should be identified as such in the system documentation. Non-standard extensions, when used, may change the behavior of utilities, functions, or facilities defined by IEEE Std 1003.1-200x. The conformance document shall define an environment in which an application can be run with the behavior specified by IEEE Std 1003.1-200x. In no case shall such an environment require modification of a Strictly Conforming POSIX Application (see Section 2.2.1 (on page 29)).

2.1.2 Documentation

A conformance document with the following information shall be available for an implementation claiming conformance to IEEE Std 1003.1-200x. The conformance document shall have the same structure as IEEE Std 1003.1-200x, with the information presented in the appropriate sections and subsections. Sections and subsections that consist solely of subordinate section titles, with no other information, are not required. The conformance document shall not contain information about extended facilities or capabilities outside the scope of IEEE Std 1003.1-200x.

The conformance document shall contain a statement that indicates the full name, number, and date of the standard that applies. The conformance document may also list international software standards that are available for use by a Conforming POSIX Application. Applicable characteristics where documentation is required by one of these standards, or by standards of government bodies, may also be included.

The conformance document shall describe the limit values found in the headers **<limits.h>** (on page 245) and **<unistd.h>** (on page 398), stating values, the conditions under which those values may change, and the limits of such variations, if any.

The conformance document shall describe the behavior of the implementation for all implementation-defined features defined in IEEE Std 1003.1-200x. This requirement shall be met by listing these features and providing either a specific reference to the system documentation or providing full syntax and semantics of these features. When the value or behavior in the implementation is designed to be variable or customized on each instantiation of the system, the implementation provider shall document the nature and permissible ranges of this variation.

The conformance document may specify the behavior of the implementation for those features where IEEE Std 1003.1-200x states that implementations may vary or where features are identified as undefined or unspecified.

The conformance document shall not contain documentation other than that specified in the preceding paragraphs except where such documentation is specifically allowed or required by other provisions of IEEE Std 1003.1-200x.

The phrases ''shall document'' or ''shall be documented'' in IEEE Std 1003.1-200x mean that documentation of the feature shall appear in the conformance document, as described previously, unless there is an explicit reference in the conformance document to show where the information can be found in the system documentation.

The system documentation should also contain the information found in the conformance document.

2.1.3 POSIX Conformance

A conforming implementation shall meet the following criteria for POSIX conformance.

2.1.3.1 POSIX System Interfaces

- The system shall support all the mandatory functions and headers defined in IEEE Std 1003.1-200x, and shall set the symbolic constant _POSIX_VERSION to the value 200xxxL.
- Although all implementations conforming to IEEE Std 1003.1-200x support all the features described below, there may be system-dependent or file system-dependent configuration procedures that can remove or modify any or all of these features. Such configurations should not be made if strict compliance is required.

  The following symbolic constants shall either be undefined or defined with a value other than −1. If a constant is undefined, an application should use the *sysconf*( ), *pathconf*( ), or *fpathconf*( ) functions, or the *getconf* utility, to determine which features are present on the system at that time or for the particular pathname in question.

  — _POSIX_CHOWN_RESTRICTED

  The use of *chown*( ) is restricted to a process with appropriate privileges, and to changing the group ID of a file only to the effective group ID of the process or to one of its supplementary group IDs.

  — _POSIX_NO_TRUNC

  Pathname components longer than {NAME_MAX} generate an error.

- The following symbolic constants shall be defined as follows:
  - _POSIX_JOB_CONTROL shall have a value greater than zero.
  - _POSIX_SAVED_IDS shall have a value greater than zero.
  - _POSIX_VDISABLE shall have a value other than −1.

  Note: The symbols above represent historical options that are no longer allowed as options, but are retained here for backwards-compatibility of applications.

- The system may support one or more options (see Section 2.1.6 (on page 26)) denoted by the following symbolic constants:
  - _POSIX_ADVISORY_INFO
  - _POSIX_ASYNCHRONOUS_IO
  - _POSIX_BARRIERS
  - _POSIX_CLOCK_SELECTION
  - _POSIX_CPUTIME
  - _POSIX_FSYNC
  - _POSIX_IPV6
  - _POSIX_MAPPED_FILES
  - _POSIX_MEMLOCK
  - _POSIX_MEMLOCK_RANGE
  - _POSIX_MEMORY_PROTECTION
  - _POSIX_MESSAGE_PASSING
  - _POSIX_MONOTONIC_CLOCK
  - _POSIX_PRIORITIZED_IO
  - _POSIX_PRIORITY_SCHEDULING
  - _POSIX_RAW_SOCKETS
  - _POSIX_REALTIME_SIGNALS
  - _POSIX_SEMAPHORES
  - _POSIX_SHARED_MEMORY_OBJECTS
  - _POSIX_SPAWN
  - _POSIX_SPIN_LOCKS
  - _POSIX_SPORADIC_SERVER
  - _POSIX_SYNCHRONIZED_IO
  - _POSIX_THREAD_ATTR_STACKADDR
  - _POSIX_THREAD_CPUTIME
  - _POSIX_THREAD_ATTR_STACKSIZE
  - _POSIX_THREAD_PRIO_INHERIT
  - _POSIX_THREAD_PRIO_PROTECT
  - _POSIX_THREAD_PRIORITY_SCHEDULING
  - _POSIX_THREAD_PROCESS_SHARED
  - _POSIX_THREAD_SAFE_FUNCTIONS
  - _POSIX_THREAD_SPORADIC_SERVER
  - _POSIX_THREADS

- — _POSIX_TIMEOUTS
- — _POSIX_TIMERS
- — _POSIX_TRACE
- — _POSIX_TRACE_EVENT_FILTER
- — _POSIX_TRACE_INHERIT
- — _POSIX_TRACE_LOG
- — _POSIX_TYPED_MEMORY_OBJECTS

If any of the symbolic constants _POSIX_TRACE_EVENT_FILTER, _POSIX_TRACE_LOG, or _POSIX_TRACE_INHERIT is defined to have a value other than –1, then the symbolic constant _POSIX_TRACE shall also be defined to have a value other than –1.

XSI

- The system may support the XSI extensions (see Section 2.1.5.2 (on page 21)) denoted by the following symbolic constants:
  - — _XOPEN_CRYPT
  - — _XOPEN_LEGACY
  - — _XOPEN_REALTIME
  - — _XOPEN_REALTIME_THREADS
  - — _XOPEN_UNIX

2.1.3.2 *POSIX Shell and Utilities*

- The system shall provide all the mandatory utilities in the Shell and Utilities volume of IEEE Std 1003.1-200x with all the functional behavior described therein.
- The system shall support the Large File capabilities described in the Shell and Utilities volume of IEEE Std 1003.1-200x.
- The system may support one or more options (see Section 2.1.6 (on page 26)) denoted by the following symbolic constants. (The literal names below apply to the *getconf* utility.)
  - — POSIX2_C_DEV
  - — POSIX2_CHAR_TERM
  - — POSIX2_FORT_DEV
  - — POSIX2_FORT_RUN
  - — POSIX2_LOCALEDEF
  - — POSIX2_PBS
  - — POSIX2_PBS_ACCOUNTING
  - — POSIX2_PBS_LOCATE
  - — POSIX2_PBS_MESSAGE
  - — POSIX2_PBS_TRACK
  - — POSIX2_SW_DEV
  - — POSIX2_UPE

- The system may support the XSI extensions (see Section 2.1.4).

Additional language bindings and development utility options may be provided in other related standards or in a future version of IEEE Std 1003.1-200x. In the former case, additional symbolic constants of the same general form as shown in this subsection should be defined by the related standard document and made available to the application without requiring IEEE Std 1003.1-200x to be updated.

2.1.4 XSI Conformance

XSI This section describes the criteria for implementations conforming to the X/Open System Interface extension. This functionality is dependent on the support of the XSI extension (and the rest of this section is not further shaded).

IEEE Std 1003.1-200x describes utilities, functions, and facilities offered to application programs by the X/Open System Interface (XSI). An XSI-conforming implementation shall meet the criteria for POSIX conformance and the following requirements.

2.1.4.1 XSI System Interfaces

- The system shall support all the functions and headers defined in IEEE Std 1003.1-200x as part of the XSI extension denoted by the symbolic constant _XOPEN_UNIX and any extensions marked with the XSI extension marking (see Section 1.5.1 (on page 6)).
- The system shall support the *mmap*( ), *munmap*( ), and *msync*( ) functions.
- The system shall support the following options defined within IEEE Std 1003.1-200x (see Section 2.1.6 (on page 26)):

  — _POSIX_FSYNC

  — _POSIX_MAPPED_FILES

  — _POSIX_MEMORY_PROTECTION

  — _POSIX_THREAD_ATTR_STACKADDR

  — _POSIX_THREAD_ATTR_STACKSIZE

  — _POSIX_THREAD_PROCESS_SHARED

  — _POSIX_THREAD_SAFE_FUNCTIONS

  — _POSIX_THREADS

- The system may support the following XSI Option Groups (see Section 2.1.5.2 (on page 21)) defined within IEEE Std 1003.1-200x: |

  — Encryption

  — Realtime

  — Advanced Realtime

  — Realtime Threads

  — Advanced Realtime Threads

  — Tracing

  — XSI STREAMS

  — Legacy

2.1.4.2 XSI Shell and Utilities Conformance

- The system shall support all the utilities defined in the Shell and Utilities volume of IEEE Std 1003.1-200x as part of the XSI extension denoted by the XSI marking in the SYNOPSIS section, and any extensions marked with the XSI extension marking (see Section 1.5.1 (on page 6)) within the text.
- The system shall support the User Portability Utilities option.
- The system shall support creation of locales (see Chapter 7 (on page 119)).
- The C-language Development utility *c99* shall be supported.
- The XSI Development Utilities option may be supported. It consists of the following software development utilities:

  admin
  cflow
  ctags
  cxref
  delta
  get
  m4
  prs
  rmdel
  sact
  sccs
  unget
  val
  what

- Within the utilities that are provided, functionality marked by the code OF (see Section 1.5.1 (on page 6)) need not be provided.

2.1.5 Option Groups

An Option Group is a group of related functions or options defined within the System Interfaces volume of IEEE Std 1003.1-200x.

If an implementation supports an Option Group, then the system shall support the functional behavior described herein.

If an implementation does not support an Option Group, then the system need not support the functional behavior described herein.

2.1.5.1 Subprofiling Considerations

Profiling standards supporting functional requirements less than that required in IEEE Std 1003.1-200x may subset both mandatory and optional functionality required for POSIX Conformance (see Section 2.1.3 (on page 16)) or XSI Conformance (see Section 2.1.4 (on page 19)). Such profiles shall organize the subsets into Subprofiling Option Groups.

The Rationale (Informative) volume of IEEE Std 1003.1-200x, Appendix E, Subprofiling Considerations (Informative) describes a representative set of such Subprofiling Option Groups for use by profiles applicable to specialized realtime systems. IEEE Std 1003.1-200x does not require that the presence of Subprofiling Option Groups be testable at compile-time (as symbols defined in any header) or at runtime (via *sysconf*( ) or *getconf*).

A Subprofiling Option Group may provide basic system functionality that other Subprofiling Option Groups and other options depend upon.[3] If a profile of IEEE Std 1003.1-200x does not

---

[3] As an example, the File System profiling option group provides underlying support for pathname resolution and file creation which are needed by any interface in IEEE Std 1003.1-200x that parses a *path* argument. If a profile requires support for the Device Input and Output profiling option group but does not require support for the File System profiling option group, the profile must specify how pathname resolution is to behave in that profile, how the O_CREAT flag to *open*( ) is to be handled (and the use of the character `'a'` in the *mode* argument of *fopen*( ) when a filename argument names a file that does not exist), and specify lots of other details.

require an implementation to provide a Subprofiling Option Group that provides features utilized by a required Subprofiling Option Group (or option),[4] the profile shall specify[5] all of the following:

- Restricted or altered behavior of interfaces defined in IEEE Std 1003.1-200x that may differ on an implementation of the profile
- Additional behaviors that may produce undefined or unspecified results
- Additional implementation-defined behavior that implementations shall be required to document in the profile's conformance document

if any of the above is a result of the profile not requiring an interface required by IEEE Std 1003.1-200x.

The following additional rules shall apply to all standard profiles of IEEE Std 1003.1-200x:

- Any application that conforms to that profile shall also conform to IEEE Std 1003.1-200x (that is, a profile cannot require restricted, altered, or extended behaviors).
- Any implementation that conforms to IEEE Std 1003.1-200x (including all options required by the profile) shall also conform to that profile

2.1.5.2 XSI Option Groups

XSI This section describes Option Groups to support the definition of XSI conformance within the System Interfaces volume of IEEE Std 1003.1-200x. This functionality is dependent on the support of the XSI extension (and the rest of this section is not further shaded).

The following Option Groups are defined.

Encryption

The Encryption Option Group is denoted by the symbolic constant _XOPEN_CRYPT. It includes the following functions:

crypt( ), *encrypt*( ), *setkey*( )

These functions are marked CRYPT.

Due to export restrictions on the decoding algorithm in some countries, implementations may be restricted in making these functions available. All the functions in the Encryption Option Group may therefore return [ENOSYS] or, alternatively, *encrypt*( ) shall return [ENOSYS] for the decryption operation.

An implementation that claims conformance to this Option Group shall set _XOPEN_CRYPT to a value other than −1.

---

[4] As an example, IEEE Std 1003.1-200x requires that implementations claiming to support the Range Memory Locking option also support the Process Memory Locking option. A profile could require that the Range Memory Locking option had to be supplied without requiring that the Process Memory Locking option be supplied as long as the profile specifies everything an application writer or system implementor would have to know to build an application or implementation conforming to the profile.

[5] Note that the profile could just specify that any use of the features not specified by the profile would produce undefined or unspecified results.

Realtime

The Realtime Option Group is denoted by the symbolic constant _XOPEN_REALTIME.

This Option Group includes a set of realtime functions drawn from options within IEEE Std 1003.1-200x (see Section 2.1.6 (on page 26)).

Where entire functions are included in the Option Group, the NAME section is marked with REALTIME. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within IEEE Std 1003.1-200x.

An implementation that claims conformance to this Option Group shall set _XOPEN_REALTIME to a value other than −1.

This Option Group consists of the set of the following options from within IEEE Std 1003.1-200x (see Section 2.1.6 (on page 26)):

_POSIX_ASYNCHRONOUS_IO
_POSIX_FSYNC
_POSIX_MAPPED_FILES
_POSIX_MEMLOCK
_POSIX_MEMLOCK_RANGE
_POSIX_MEMORY_PROTECTION
_POSIX_MESSAGE_PASSING
_POSIX_PRIORITIZED_IO
_POSIX_PRIORITY_SCHEDULING
_POSIX_REALTIME_SIGNALS
_POSIX_SEMAPHORES
_POSIX_SHARED_MEMORY_OBJECTS
_POSIX_SYNCHRONIZED_IO
_POSIX_TIMERS

If the symbolic constant _XOPEN_REALTIME is defined to have a value other than −1, then the following symbolic constants shall be defined by the implementation to have the value 200xxxL:

_POSIX_ASYNCHRONOUS_IO
_POSIX_MEMLOCK
_POSIX_MEMLOCK_RANGE
_POSIX_MESSAGE_PASSING
_POSIX_PRIORITY_SCHEDULING
_POSIX_REALTIME_SIGNALS
_POSIX_SEMAPHORES
_POSIX_SHARED_MEMORY_OBJECTS
_POSIX_SYNCHRONIZED_IO
_POSIX_TIMERS

The functionality associated with _POSIX_MAPPED_FILES, _POSIX_MEMORY_PROTECTION, and _POSIX_FSYNC is always supported on XSI-conformant systems.

Support of _POSIX_PRIORITIZED_IO on XSI-conformant systems is optional. If this functionality is supported, then _POSIX_PRIORITIZED_IO shall be set to a value other than −1. Otherwise, it shall be undefined.

If _POSIX_PRIORITIZED_IO is supported, then asynchronous I/O operations performed by *aio_read*( ), *aio_write*( ), and *lio_listio*( ) shall be submitted at a priority equal to the scheduling priority of the process minus *aiocbp->aio_reqprio*. The implementation shall also document for which files I/O prioritization is supported.

Advanced Realtime

An implementation that claims conformance to this Option Group shall also support the Realtime Option Group.

Where entire functions are included in the Option Group, the NAME section is marked with ADVANCED REALTIME. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within IEEE Std 1003.1-200x.

This Option Group consists of the set of the following options from within IEEE Std 1003.1-200x (see Section 2.1.6 (on page 26)):

_POSIX_ADVISORY_INFO
_POSIX_CLOCK_SELECTION
_POSIX_CPUTIME
_POSIX_MONOTONIC_CLOCK
_POSIX_SPAWN
_POSIX_SPORADIC_SERVER
_POSIX_TIMEOUTS
_POSIX_TYPED_MEMORY_OBJECTS

If the implementation supports the Advanced Realtime Option Group, then the following symbolic constants shall be defined by the implementation to have the value 200xxxL:

_POSIX_ADVISORY_INFO
_POSIX_CLOCK_SELECTION
_POSIX_CPUTIME
_POSIX_MONOTONIC_CLOCK
_POSIX_SPAWN
_POSIX_SPORADIC_SERVER
_POSIX_TIMEOUTS
_POSIX_TYPED_MEMORY_OBJECTS

If the symbolic constant _POSIX_SPORADIC_SERVER is defined, then the symbolic constant _POSIX_PRIORITY_SCHEDULING shall also be defined by the implementation to have the value 200xxxL.

If the symbolic constant _POSIX_CPUTIME is defined, then the symbolic constant _POSIX_TIMERS shall also be defined by the implementation to have the value 200xxxL.

If the symbolic constant _POSIX_MONOTONIC_CLOCK is defined, then the symbolic constant _POSIX_TIMERS shall also be defined by the implementation to have the value 200xxxL.

If the symbolic constant _POSIX_CLOCK_SELECTION is defined, then the symbolic constant _POSIX_TIMERS shall also be defined by the implementation to have the value 200xxxL.

Realtime Threads

The Realtime Threads Option Group is denoted by the symbolic constant _XOPEN_REALTIME_THREADS.

This Option Group consists of the set of the following options from within IEEE Std 1003.1-200x (see Section 2.1.6 (on page 26)):

_POSIX_THREAD_PRIO_INHERIT
_POSIX_THREAD_PRIO_PROTECT
_POSIX_THREAD_PRIORITY_SCHEDULING

Where applicable, whole pages are marked REALTIME THREADS, together with the appropriate option margin legend for the SYNOPSIS section (see Section 1.5.1 (on page 6)).

An implementation that claims conformance to this Option Group shall set _XOPEN_REALTIME_THREADS to a value other than –1.

If the symbol _XOPEN_REALTIME_THREADS is defined to have a value other than –1, then the following options shall also be defined by the implementation to have the value 200xxxL:

_POSIX_THREAD_PRIO_INHERIT
_POSIX_THREAD_PRIO_PROTECT
_POSIX_THREAD_PRIORITY_SCHEDULING

Advanced Realtime Threads

An implementation that claims conformance to this Option Group shall also support the Realtime Threads Option Group.

Where entire functions are included in the Option Group, the NAME section is marked with ADVANCED REALTIME THREADS. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within IEEE Std 1003.1-200x.

This Option Group consists of the set of the following options from within IEEE Std 1003.1-200x (see Section 2.1.6 (on page 26)):

_POSIX_BARRIERS
_POSIX_SPIN_LOCKS
_POSIX_THREAD_CPUTIME
_POSIX_THREAD_SPORADIC_SERVER

If the symbolic constant _POSIX_THREAD_SPORADIC_SERVER is defined to have the value 200xxxL, then the symbolic constant _POSIX_THREAD_PRIORITY_SCHEDULING shall also be defined by the implementation to have the value 200xxxL.

If the symbolic constant _POSIX_THREAD_CPUTIME is defined to have the value 200xxxL, then the symbolic constant _POSIX_TIMERS shall also be defined by the implementation to have the value 200xxxL.

If the symbolic constant _POSIX_BARRIERS is defined to have the value 200xxxL, then the symbolic constants _POSIX_THREADS and _POSIX_THREAD_SAFE_FUNCTIONS shall also be defined by the implementation to have the value 200xxxL.

If the symbolic constant _POSIX_SPIN_LOCKS is defined to have the value 200xxxL, then the symbolic constants _POSIX_THREADS and _POSIX_THREAD_SAFE_FUNCTIONS shall also be defined by the implementation to have the value 200xxxL.

If the implementation supports the Advanced Realtime Threads Option Group, then the following symbolic constants shall be defined by the implementation to have the value 200xxxL:

_POSIX_BARRIERS
_POSIX_SPIN_LOCKS
_POSIX_THREAD_CPUTIME
_POSIX_THREAD_SPORADIC_SERVER

Tracing

This Option Group includes a set of tracing functions drawn from options within IEEE Std 1003.1-200x (see Section 2.1.6 (on page 26)).

Where entire functions are included in the Option Group, the NAME section is marked with TRACING. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within IEEE Std 1003.1-200x.

This Option Group consists of the set of the following options from within IEEE Std 1003.1-200x (see Section 2.1.6 (on page 26)):

_POSIX_TRACE
_POSIX_TRACE_EVENT_FILTER
_POSIX_TRACE_LOG
_POSIX_TRACE_INHERIT

If the implementation supports the Tracing Option Group, then the following symbolic constants shall be defined by the implementation to have the value 200xxxL:

_POSIX_TRACE
_POSIX_TRACE_EVENT_FILTER
_POSIX_TRACE_LOG
_POSIX_TRACE_INHERIT

XSI STREAMS

The XSI STREAMS Option Group is denoted by the symbolic constant _XOPEN_STREAMS.

This Option Group includes functionality related to STREAMS, a uniform mechanism for implementing networking services and other character-based I/O as described in the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.6, STREAMS.

It includes the following functions:

fattach( ), *fdetach*( ), *getmsg*( ), *getpmsg*( ), *ioctl*( ), *isastream*( ), *putmsg*( ), *putpmsg*( )

and the **<stropts.h>** header.

Where applicable, whole pages are marked STREAMS, together with the appropriate option margin legend for the SYNOPSIS section (see Section 1.5.1 (on page 6)). Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within IEEE Std 1003.1-200x.

An implementation that claims conformance to this Open Group shall set _XOPEN_STREAMS to a value other than –1.

Legacy

The Legacy Option Group is denoted by the symbolic constant _XOPEN_LEGACY.

The Legacy Option Group includes the functions and headers which were mandatory in previous versions of IEEE Std 1003.1-200x but are optional in this version.

These functions and headers are retained in IEEE Std 1003.1-200x because of their widespread use. Application writers should not rely on the existence of these functions or headers in new applications, but should follow the migration path detailed in the APPLICATION USAGE sections of the relevant pages.

Various factors may have contributed to the decision to mark a function or header LEGACY. In all cases, the specific reasons for the withdrawal of a function or header are documented on the relevant pages.

Once a function or header is marked LEGACY, no modifications are made to the specifications of such functions or headers other than to the APPLICATION USAGE sections of the relevant pages.

The functions and headers which form this Option Group are as follows:

bcmp( ), *bcopy*( ), *bzero*( ), *ecvt*( ), *fcvt*( ), *ftime*( ), *gcvt*( ), *getwd*( ), *index*( ), *mktemp*( ), *rindex*( ), *utimes*( ), *wcswcs*( )

An implementation that claims conformance to this Option Group shall set _XOPEN_LEGACY to a value other than −1.

2.1.6 Options

The symbolic constants defined in **<unistd.h>**, **Constants for Options and Option Groups** (on page 398) reflect implementation options for IEEE Std 1003.1-200x. These symbols can be used by the application to determine which optional facilities are present on the implementation. The *sysconf*( ) function defined in the System Interfaces volume of IEEE Std 1003.1-200x or the *getconf* utility defined in the Shell and Utilities volume of IEEE Std 1003.1-200x can be used to retrieve the value of each symbol on each specific implementation to determine whether the option is supported.

Where an option is not supported, the associated utilities, functions, or facilities need not be present.

Margin codes are defined for each option (see Section 1.5.1 (on page 6)).

2.1.6.1 System Interfaces

Refer to **<unistd.h>**, **Constants for Options and Option Groups** (on page 398) for the list of options.

2.1.6.2 Shell and Utilities

Each of these symbols shall be considered valid names by the implementation. Refer to **<unistd.h>**, **Constants for Options and Option Groups** (on page 398).

The literal names shown below apply only to the *getconf* utility.

CD POSIX2_C_DEV

The system supports the C-Language Development Utilities option.

The utilities in the C-Language Development Utilities option are used for the development of C-language applications, including compilation or translation of C source code and complex program generators for simple lexical tasks and processing of context-free grammars.

The utilities listed below may be provided by a conforming system; however, any system claiming conformance to the C-Language Development Utilities option shall provide all of the utilities listed.

c99
lex
yacc

POSIX2_CHAR_TERM

The system supports the Terminal Characteristics option. This value need not be present on a system not supporting the User Portability Utilities option.

Where applicable, the dependency is noted within the description of the utility.

This option applies only to systems supporting the User Portability Utilities option. If supported, then the system supports at least one terminal type capable of all operations described in IEEE Std 1003.1-200x; see Section 10.2 (on page 181).

FD POSIX2_FORT_DEV

The system supports the FORTRAN Development Utilities option.

The *fort77* FORTRAN compiler is the only utility in the FORTRAN Development Utilities option. This is used for the development of FORTRAN language applications, including compilation or translation of FORTRAN source code.

The *fort77* utility may be provided by a conforming system; however, any system claiming conformance to the FORTRAN Development Utilities option shall provide the *fort77* utility.

FR POSIX2_FORT_RUN

The system supports the FORTRAN Runtime Utilities option.

The *asa* utility is the only utility in the FORTRAN Runtime Utilities option.

The *asa* utility may be provided by a conforming system; however, any system claiming conformance to the FORTRAN Runtime Utilities option shall provide the *asa* utility.

POSIX2_LOCALEDEF

The system supports the Locale Creation Utilities option.

If supported, the system supports the creation of locales as described in the *localedef* utility.

The *localedef* utility may be provided by a conforming system; however, any system claiming conformance to the Locale Creation Utilities option shall provide the *localedef* utility.

BE POSIX2_PBS

The system supports the Batch Environment Services and Utilities option (see the Shell and Utilities volume of IEEE Std 1003.1-200x, Chapter 3, Batch Environment Services).

Note: The Batch Environment Services and Utilities option is a combination of mandatory and optional batch services and utilities. The POSIX_PBS symbolic constant implies the system supports all the mandatory batch services and utilities.

POSIX2_PBS_ACCOUNTING

The system supports the Batch Accounting option.

POSIX2_PBS_CHECKPOINT

The system supports the Batch Checkpoint/Restart option.

POSIX2_PBS_LOCATE

The system supports the Locate Batch Job Request option.

POSIX2_PBS_MESSAGE

The system supports the Batch Job Message Request option.

POSIX2_PBS_TRACK

The system supports the Track Batch Job Request option.

SD POSIX2_SW_DEV

The system supports the Software Development Utilities option.

The utilities in the Software Development Utilities option are used for the development of applications, including compilation or translation of source code, the creation and maintenance of library archives, and the maintenance of groups of inter-dependent programs.

The utilities listed below may be provided by the conforming system; however, any system claiming conformance to the Software Development Utilities option shall provide all of the utilities listed here.

ar
make
nm
strip

UP POSIX2_UPE

The system supports the User Portability Utilities option.

The utilities in the User Portability Utilities option shall be implemented on all systems that claim conformance to this option. Certain utilities are noted as having features that cannot be implemented on all terminal types; if the POSIX2_CHAR_TERM option is supported, the system shall support all such features on at least one terminal type; see Section 10.2 (on page 181).

Some of the utilities are required only on systems that also support the Software Development Utilities option, or the character-at-a-time terminal option (see Section 10.2 (on page 181)); such utilities have this noted in their DESCRIPTION sections. All of the other utilities listed are required only on systems that claim conformance to the User Portability Utilities option.

2.2 Application Conformance

All applications claiming conformance to IEEE Std 1003.1-200x shall use only language-dependent services for the C programming language described in Section 2.3 (on page 31), shall use only the utilities and facilities defined in the Shell and Utilities volume of IEEE Std 1003.1-200x, and shall fall within one of the following categories.

2.2.1 Strictly Conforming POSIX Application

A Strictly Conforming POSIX Application is an application that requires only the facilities described in IEEE Std 1003.1-200x. Such an application:

1. Shall accept any implementation behavior that results from actions it takes in areas described in IEEE Std 1003.1-200x as *implementation-defined* or *unspecified*, or where IEEE Std 1003.1-200x indicates that implementations may vary
2. Shall not perform any actions that are described as producing *undefined* results
3. For symbolic constants, shall accept any value in the range permitted by IEEE Std 1003.1-200x, but shall not rely on any value in the range being greater than the minimums listed or being less than the maximums listed in IEEE Std 1003.1-200x
4. Shall not use facilities designated as *obsolescent*
5. Is required to tolerate and permitted to adapt to the presence or absence of optional facilities whose availability is indicated by Section 2.1.3 (on page 16)
6. For the C programming language, shall not produce any output dependent on any behavior described in the ISO/IEC 9899:1999 standard as *unspecified*, *undefined*, or *implementation-defined*, unless the System Interfaces volume of IEEE Std 1003.1-200x specifies the behavior
7. For the C programming language, shall not exceed any minimum implementation limit defined in the ISO/IEC 9899:1999 standard, unless the System Interfaces volume of IEEE Std 1003.1-200x specifies a higher minimum implementation limit
8. For the C programming language, shall define _POSIX_C_SOURCE to be 200xxxL before any header is included |

Within IEEE Std 1003.1-200x, any restrictions placed upon a Conforming POSIX Application shall restrict a Strictly Conforming POSIX Application.

2.2.2 Conforming POSIX Application

2.2.2.1 ISO/IEC Conforming POSIX Application

An ISO/IEC Conforming POSIX Application is an application that uses only the facilities described in IEEE Std 1003.1-200x and approved Conforming Language bindings for any ISO or IEC standard. Such an application shall include a statement of conformance that documents all options and limit dependencies, and all other ISO or IEC standards used.

2.2.2.2 <National Body> Conforming POSIX Application

A <National Body> Conforming POSIX Application differs from an ISO/IEC Conforming POSIX Application in that it also may use specific standards of a single ISO/IEC member body referred to here as *<National Body>*. Such an application shall include a statement of conformance that documents all options and limit dependencies, and all other <National Body> standards used.

2.2.3 Conforming POSIX Application Using Extensions

A Conforming POSIX Application Using Extensions is an application that differs from a Conforming POSIX Application only in that it uses non-standard facilities that are consistent with IEEE Std 1003.1-200x. Such an application shall fully document its requirements for these extended facilities, in addition to the documentation required of a Conforming POSIX Application. A Conforming POSIX Application Using Extensions shall be either an ISO/IEC Conforming POSIX Application Using Extensions or a <National Body> Conforming POSIX Application Using Extensions (see Section 2.2.2.1 (on page 29) and Section 2.2.2.2 (on page 29)).

2.2.4 Strictly Conforming XSI Application

A Strictly Conforming XSI Application is an application that requires only the facilities described in IEEE Std 1003.1-200x. Such an application:

1. Shall accept any implementation behavior that results from actions it takes in areas described in IEEE Std 1003.1-200x as *implementation-defined* or *unspecified*, or where IEEE Std 1003.1-200x indicates that implementations may vary
2. Shall not perform any actions that are described as producing *undefined* results
3. For symbolic constants, shall accept any value in the range permitted by IEEE Std 1003.1-200x, but shall not rely on any value in the range being greater than the minimums listed or being less than the maximums listed in IEEE Std 1003.1-200x |
4. Shall not use facilities designated as *obsolescent*
5. Is required to tolerate and permitted to adapt to the presence or absence of optional facilities whose availability is indicated by Section 2.1.4 (on page 19)
6. For the C programming language, shall not produce any output dependent on any behavior described in the ISO C standard as *unspecified*, *undefined*, or *implementation-defined*, unless the System Interfaces volume of IEEE Std 1003.1-200x specifies the behavior
7. For the C programming language, shall not exceed any minimum implementation limit defined in the ISO C standard, unless the System Interfaces volume of IEEE Std 1003.1-200x specifies a higher minimum implementation limit
8. For the C programming language, shall define _XOPEN_SOURCE to be 600 before any header is included

Within IEEE Std 1003.1-200x, any restrictions placed upon a Conforming POSIX Application shall restrict a Strictly Conforming XSI Application.

2.2.5 Conforming XSI Application Using Extensions

A Conforming XSI Application Using Extensions is an application that differs from a Strictly Conforming XSI Application only in that it uses non-standard facilities that are consistent with IEEE Std 1003.1-200x. Such an application shall fully document its requirements for these extended facilities, in addition to the documentation required of a Strictly Conforming XSI Application.

2.3 Language-Dependent Services for the C Programming Language

Implementors seeking to claim conformance using the ISO C standard shall claim POSIX conformance as described in Section 2.1.3 (on page 16).

2.4 Other Language-Related Specifications

IEEE Std 1003.1-200x is currently specified in terms of the shell command language and ISO C. Bindings to other programming languages are being developed.

If conformance to IEEE Std 1003.1-200x is claimed for implementation of any programming language, the implementation of that language shall support the use of external symbols distinct to at least 31 bytes in length in the source program text. (That is, identifiers that differ at or before the thirty-first byte shall be distinct.) If a national or international standard governing a language defines a maximum length that is less than this value, the language-defined maximum shall be supported. External symbols that differ only by case shall be distinct when the character set in use distinguishes uppercase and lowercase characters and the language permits (or requires) uppercase and lowercase characters to be distinct in external symbols.

Chapter 3

Definitions

For the purposes of IEEE Std 1003.1-200x, the terms and definitions given in Chapter 3 apply.

Note: No shading to denote extensions or options occurs in this chapter. Where the terms and definitions given in this chapter are used elsewhere in text related to extensions and options, they are shaded as appropriate.

3.1 Abortive Release

An abrupt termination of a network connection that may result in the loss of data.

3.2 Absolute Pathname

A pathname beginning with a single or more than two slashes; see also Section 3.266 (on page 69).

Note: Pathname Resolution is defined in detail in Section 4.11 (on page 98).

3.3 Access Mode

A particular form of access permitted to a file.

3.4 Additional File Access Control Mechanism

An implementation-defined mechanism that is layered upon the access control mechanisms defined here, but which do not grant permissions beyond those defined herein, although they may further restrict them.

Note: File Access Permissions are defined in detail in Section 4.4 (on page 95).

3.5 Address Space

The memory locations that can be referenced by a process or the threads of a process.

3.6 Advisory Information

An interface that advises the implementation on (portable) application behavior so that it can optimize the system.

3.7 Affirmative Response

An input string that matches one of the responses acceptable to the *LC_MESSAGES* category keyword **yesexpr**, matching an extended regular expression in the current locale.

Note: The *LC_MESSAGES* category is defined in detail in Section 7.3.6 (on page 148).

3.8 Alert

To cause the user's terminal to give some audible or visual indication that an error or some other event has occurred. When the standard output is directed to a terminal device, the method for alerting the terminal user is unspecified. When the standard output is not directed to a terminal device, the alert is accomplished by writing the <alert> to standard output (unless the utility description indicates that the use of standard output produces undefined results in this case).

3.9 Alert Character (<alert>)

A character that in the output stream should cause a terminal to alert its user via a visual or audible notification. It is the character designated by `'\a'` in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the alert function.

3.10 Alias Name

In the shell command language, a word consisting solely of underscores, digits, and alphabetics from the portable character set and any of the following characters: `'!'`, `'%'`, `','`, `'@'`.

Implementations may allow other characters within alias names as an extension.

Note: The portable character set is defined in detail in Section 6.1 (on page 111).

3.11 Alignment

A requirement that objects of a particular type be located on storage boundaries with addresses that are particular multiples of a byte address.

Note: See also the ISO C standard, Section B3.

3.12 Alternate File Access Control Mechanism

An implementation-defined mechanism that is independent of the access control mechanisms defined herein, and which if enabled on a file may either restrict or extend the permissions of a given user. IEEE Std 1003.1-200x defines when such mechanisms can be enabled and when they are disabled.

Note: File Access Permissions are defined in detail in Section 4.4 (on page 95).

3.13 Alternate Signal Stack

Memory associated with a thread, established upon request by the implementation for a thread, separate from the thread signal stack, in which signal handlers responding to signals sent to that thread may be executed.

3.14 Ancillary Data

Protocol-specific, local system-specific, or optional information. The information can be both local or end-to-end significant, header information, part of a data portion, protocol-specific, and implementation or system-specific.

3.15 Angle Brackets

The characters '<' (left-angle-bracket) and '>' (right-angle-bracket). When used in the phrase ‘‘enclosed in angle brackets’’, the symbol '<' immediately precedes the object to be enclosed, and '>' immediately follows it. When describing these characters in the portable character set, the names <less-than-sign> and <greater-than-sign> are used.

3.16 Application

A computer program that performs some desired function.

3.17 Application Address

Endpoint address of a specific application.

3.18 Application Program Interface (API)

The definition of syntax and semantics for providing computer system services.

3.19 Appropriate Privileges

An implementation-defined means of associating privileges with a process with regard to the function calls, function call options, and the commands that need special privileges. There may be zero or more such means. These means (or lack thereof) are described in the conformance document.

Note: Function calls are defined in the System Interfaces volume of IEEE Std 1003.1-200x, and commands are defined in the Shell and Utilities volume of IEEE Std 1003.1-200x.

3.20 Argument

In the shell command language, a parameter passed to a utility as the equivalent of a single string in the *argv* array created by one of the *exec* functions. An argument is one of the options, option-arguments, or operands following the command name.

Note: The Utility Argument Syntax is defined in detail in Section 12.1 (on page 197) and the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.9.1.1, Command Search and Execution.

In the C language, an expression in a function call expression or a sequence of preprocessing tokens in a function-like macro invocation.

3.21 Arm (a Timer)

To start a timer measuring the passage of time, enabling notifying a process when the specified time or time interval has passed.

3.22 Asterisk

The character `'*'`.

3.23 Async-Cancel-Safe Function

A function that may be safely invoked by an application while the asynchronous form of cancelation is enabled. No function is async-cancel-safe unless explicitly described as such.

3.24 Asynchronous Events

Events that occur independently of the execution of the application.

3.25 Asynchronous Input and Output

A functionality enhancement to allow an application process to queue data input and output commands with asynchronous notification of completion.

3.26 Async-Signal-Safe Function

A function that may be invoked, without restriction, from signal-catching functions. No function is async-signal-safe unless explicitly described as such.

3.27 Asynchronously-Generated Signal

A signal that is not attributable to a specific thread. Examples are signals sent via *kill*( ), signals sent from the keyboard, and signals delivered to process groups. Being asynchronous is a property of how the signal was generated and not a property of the signal number. All signals may be generated asynchronously.

Note: The *kill*( ) function is defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.28 Asynchronous I/O Operation

An I/O operation that does not of itself cause the thread requesting the I/O to be blocked from further use of the processor.

This implies that the process and the I/O operation may be running concurrently.

3.29 Asynchronous I/O Completion

For an asynchronous read or write operation, when a corresponding synchronous read or write would have completed and when any associated status fields have been updated.

3.30 Authentication

The process of validating a user or process to verify that the user or process is not a counterfeit.

3.31 Authorization

The process of verifying that a user or process has permission to use a resource in the manner requested.

To ensure security, the user or process would also need to be authenticated before granting access.

3.32 Background Job

See *Background Process Group* in Section 3.34.

3.33 Background Process

A process that is a member of a background process group.

3.34 Background Process Group (or Background Job)

Any process group, other than a foreground process group, that is a member of a session that has established a connection with a controlling terminal.

3.35 Backquote

The character '`', also known as a *grave accent*.

3.36 Backslash

The character '\', also known as a *reverse solidus*.

3.37 Backspace Character (<backspace>)

A character that, in the output stream, should cause printing (or displaying) to occur one column position previous to the position about to be printed. If the position about to be printed is at the beginning of the current line, the behavior is unspecified. It is the character designated by '\b' in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the backspace function. The <backspace> defined here is not necessarily the ERASE special character.

Note: Special Characters are defined in detail in Section 11.1.9 (on page 187).

3.38 Barrier

A synchronization object that allows multiple threads to synchronize at a particular point in their execution.

3.39 Base Character

One of the set of characters defined in the Latin alphabet. In Western European languages other than English, these characters are commonly used with diacritical marks (accents, cedilla, and so on) to extend the range of characters in an alphabet.

3.40 Basename

The final, or only, filename in a pathname.

3.41 Basic Regular Expression (BRE)

A regular expression (see Section 3.316 (on page 76)) used by the majority of utilities that select strings from a set of character strings.

Note: Basic Regular Expressions are described in detail in Section 9.3 (on page 167).

3.42 Batch Access List

A list of user IDs and group IDs of those users and groups authorized to place batch jobs in a batch queue.

A batch access list is associated with a batch queue. A batch server uses the batch access list of a batch queue as one of the criteria in deciding to put a batch job in a batch queue.

3.43 Batch Administrator

A user that is authorized to modify all the attributes of queues and jobs and to change the status of a batch server.

3.44 Batch Client

A computational entity that utilizes batch services by making requests of batch servers.

Batch clients often provide the means by which users access batch services, although a batch server may act as a batch client by virtue of making requests of another batch server.

3.45 Batch Destination

The batch server in a batch system to which a batch job should be sent for processing.

Acceptance of a batch job at a batch destination is the responsibility of a receiving batch server. A batch destination may consist of a batch server-specific portion, a network-wide portion, or both. The batch server-specific portion is referred to as the *batch queue*. The network-wide portion is referred to as a *batch server name*.

3.46 Batch Destination Identifier

A string that identifies a specific batch destination.

A string of characters in the portable character set used to specify a particular batch destination.

Note: The portable character set is defined in detail in Section 6.1 (on page 111).

3.47 Batch Directive

A line from a file that is interpreted by the batch server. The line is usually in the form of a comment and is an additional means of passing options to the *qsub* utility.

Note: The *qsub* utility is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x.

3.48 Batch Job

A set of computational tasks for a computing system.

Batch jobs are managed by batch servers.

Once created, a batch job may be executing or pending execution. A batch job that is executing has an associated session leader (a process) that initiates and monitors the computational tasks of the batch job.

3.49 Batch Job Attribute

A named data type whose value affects the processing of a batch job.

The values of the attributes of a batch job affect the processing of that job by the batch server that manages the batch job.

3.50 Batch Job Identifier

A unique name for a batch job. A name that is unique among all other batch job identifiers in a batch system and that identifies the batch server to which the batch job was originally submitted.

3.51 Batch Job Name

A label that is an attribute of a batch job. The batch job name is not necessarily unique.

3.52 Batch Job Owner

The *username@hostname* of the user submitting the batch job, where *username* is a user name (see also Section 3.426 (on page 91)) and *hostname* is a network host name.

3.53 Batch Job Priority

A value specified by the user that may be used by an implementation to determine the order in which batch jobs are selected to be executed. Job priority has a numeric value in the range −1 024 to 1 023.

Note: The batch job priority is not the execution priority (nice value) of the batch job.

3.54 Batch Job State

An attribute of a batch job which determines the types of requests that the batch server that manages the batch job can accept for the batch job. Valid states include QUEUED, RUNNING, HELD, WAITING, EXITING, and TRANSITING.

3.55 Batch Name Service

A service that assigns batch names that are unique within the batch name space, and that can translate a unique batch name into the location of the named batch entity.

3.56 Batch Name Space

The environment within which a batch name is known to be unique.

3.57 Batch Node

A host containing part or all of a batch system.

A batch node is a host meeting at least one of the following conditions:

- Capable of executing a batch client
- Contains a routing batch queue
- Contains an execution batch queue

3.58 Batch Operator

A user that is authorized to modify some, but not all, of the attributes of jobs and queues, and may change the status of the batch server.

3.59 Batch Queue

A manageable object that represents a set of batch jobs and is managed by a single batch server.

Note: A set of batch jobs is called a batch queue largely for historical reasons. Jobs are selected from the batch queue for execution based on attributes such as priority, resource requirements, and hold conditions.

See also the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 3.1.2, Batch Queues.

3.60 Batch Queue Attribute

A named data type whose value affects the processing of all batch jobs that are members of the batch queue.

A batch queue has attributes that affect the processing of batch jobs that are members of the batch queue.

3.61 Batch Queue Position

The place, relative to other jobs in the batch queue, occupied by a particular job in a batch queue. This is defined in part by submission time and priority; see also Section 3.62.

3.62 Batch Queue Priority

The maximum job priority allowed for any batch job in a given batch queue.

The batch queue priority is set and may be changed by users with appropriate privilege. The priority is bounded in an implementation-defined manner.

3.63 Batch Rerunability

An attribute of a batch job indicating that it may be rerun after an abnormal termination from the beginning without affecting the validity of the results.

3.64 Batch Restart

The action of resuming the processing of a batch job from the point of the last checkpoint. Typically, this is done if the batch job has been interrupted because of a system failure.

3.65 Batch Server

A computational entity that provides batch services.

3.66 Batch Server Name

A string of characters in the portable character set used to specify a particular server in a network.

Note: The portable character set is defined in detail in Section 6.1 (on page 111).

3.67 Batch Service

Computational and organizational services performed by a batch system on behalf of batch jobs.

Batch services are of two types: *requested* and *deferred*.

Note: Batch Services are listed in the Shell and Utilities volume of IEEE Std 1003.1-200x, Table 3-5, Batch Services Summary.

3.68 Batch Service Request

A solicitation of services from a batch client to a batch server.

A batch service request may entail the exchange of any number of messages between the batch client and the batch server.

When naming specific types of service requests, the term request is qualified by the type of request, as in *Queue Batch Job Request* and *Delete Batch Job Request*.

3.69 Batch Submission

The process by which a batch client requests that a batch server create a batch job via a *Queue Job Request* to perform a specified computational task.

3.70 Batch System

A collection of one or more batch servers.

3.71 Batch Target User

The name of a user on the batch destination batch server.

The target user is the user name under whose account the batch job is to execute on the destination batch server.

3.72 Batch User

A user who is authorized to make use of batch services.

3.73 Bind

The process of assigning a network address to an endpoint.

3.74 Blank Character (<blank>)

One of the characters that belong to the **blank** character class as defined via the *LC_CTYPE* category in the current locale. In the POSIX locale, a <blank> is either a <tab> or a <space>.

3.75 Blank Line

A line consisting solely of zero or more <blank>s terminated by a <newline>; see also Section 3.144 (on page 52).

3.76 Blocked Process (or Thread)

A process (or thread) that is waiting for some condition (other than the availability of a processor) to be satisfied before it can continue execution.

3.77 Blocking

A property of an open file description that causes function calls associated with it to wait for the requested action to be performed before returning.

3.78 Block-Mode Terminal

A terminal device operating in a mode incapable of the character-at-a-time input and output operations described by some of the standard utilities.

Note: Output Devices and Terminal Types are defined in detail in Section 10.2 (on page 181).

3.79 Block Special File

A file that refers to a device. A block special file is normally distinguished from a character special file by providing access to the device in a manner such that the hardware characteristics of the device are not visible.

3.80 Braces

The characters `'{'` (left brace) and `'}'` (right brace), also known as *curly braces*. When used in the phrase ‘‘enclosed in (curly) braces’’ the symbol `'{'` immediately precedes the object to be enclosed, and `'}'` immediately follows it. When describing these characters in the portable character set, the names <left-brace> and <right-brace> are used.

3.81 Brackets

The characters `'['` (left-bracket) and `']'` (right-bracket), also known as *square brackets*. When used in the phrase ‘‘enclosed in (square) brackets’’ the symbol `'['` immediately precedes the object to be enclosed, and `']'` immediately follows it. When describing these characters in the portable character set, the names <left-square-bracket> and <right-square-bracket> are used.

3.82 Broadcast

The transfer of data from one endpoint to several endpoints, as described in RFC 919 and RFC 922.

3.83 Built-In Utility (or Built-In)

A utility implemented within a shell. The utilities referred to as *special built-ins* have special qualities. Unless qualified, the term built-in includes the special built-in utilities. *Regular built-ins* are not required to be actually built into the shell on the implementation, but they do have special command-search qualities.

Note: Special Built-In Utilities are defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.14, Special Built-In Utilities.

Regular Built-In Utilities are defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.9.1.1, Command Search and Execution.

3.84 Byte

An individually addressable unit of data storage that is exactly an octet, used to store a character or a portion of a character; see also Section 3.87. A byte is composed of a contiguous sequence of 8 bits. The least significant bit is called the *low-order* bit; the most significant is called the *high-order* bit.

Note: The definition of byte from the ISO C standard is broader than the above and might accommodate hardware architectures with different sized addressable units than octets.

3.85 Byte Input/Output Functions

The functions that perform byte-oriented input from streams or byte-oriented output to streams: *fgetc*( ), *fgets*( ), *fprintf*( ), *fputc*( ), *fputs*( ), *fread*( ), *fscanf*( ), *fwrite*( ), *getc*( ), *getchar*( ), *gets*( ), *printf*( ), *putc*( ), *putchar*( ), *puts*( ), *scanf*( ), *ungetc*( ), *vfprintf*( ), and *vprintf*( ).

Note: Functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.86 Carriage-Return Character (<carriage-return>)

A character that in the output stream indicates that printing should start at the beginning of the same physical line in which the <carriage-return> occurred. It is the character designated by `'\r'` in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the movement to the beginning of the line.

3.87 Character

A sequence of one or more bytes representing a single graphic symbol or control code.

Note: This term corresponds to the ISO C standard term multi-byte character, where a single-byte character is a special case of a multi-byte character. Unlike the usage in the ISO C standard, *character* here has no necessary relationship with storage space, and *byte* is used when storage space is discussed.

See the definition of the portable character set in Section 6.1 (on page 111) for a further explanation of the graphical representations of (abstract) characters, as opposed to character encodings.

3.88 Character Array

An array of elements of type **char**.

3.89 Character Class

A named set of characters sharing an attribute associated with the name of the class. The classes and the characters that they contain are dependent on the value of the *LC_CTYPE* category in the current locale.

Note: The *LC_CTYPE* category is defined in detail in Section 7.3.1 (on page 122).

3.90 Character Set

A finite set of different characters used for the representation, organization, or control of data.

3.91 Character Special File

A file that refers to a device. One specific type of character special file is a terminal device file.

Note: The General Terminal Interface is defined in detail in Chapter 11 (on page 183).

3.92 Character String

A contiguous sequence of characters terminated by and including the first null byte.

3.93 Child Process

A new process created (by *fork*( ) or *spawn*( )) by a given process. A child process remains the child of the creating process as long as both processes continue to exist.

Note: The *fork*( ) and *spawn*( ) functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.94 Circumflex

The character `'^'`.

3.95 Clock

A software or hardware object that can be used to measure the apparent or actual passage of time.

The current value of the time measured by a clock can be queried and, possibly, set to a value within the legal range of the clock.

3.96 Clock Jump

The difference between two successive distinct values of a clock, as observed from the application via one of the ‘‘get time’’ operations.

3.97 Clock Tick

An interval of time; an implementation-defined number of these occur each second. Clock ticks are one of the units that may be used to express a value found in type **clock_t**.

3.98 Coded Character Set

A set of unambiguous rules that establishes a character set and the one-to-one relationship between each character of the set and its bit representation.

3.99 Codeset

The result of applying rules that map a numeric code value to each element of a character set. An element of a character set may be related to more than one numeric code value but the reverse is not true. However, for state-dependent encodings the relationship between numeric code values to elements of a character set may be further controlled by state information. The character set may contain fewer elements than the total number of possible numeric code values; that is, some code values may be unassigned.

Note: Character Encoding is defined in detail in Section 6.2 (on page 114).

3.100 Collating Element

The smallest entity used to determine the logical ordering of character or wide-character strings; see also Section 3.102. A collating element consists of either a single character, or two or more characters collating as a single entity. The value of the *LC_COLLATE* category in the current locale determines the current set of collating elements.

3.101 Collation

The logical ordering of character or wide-character strings according to defined precedence rules. These rules identify a collation sequence between the collating elements, and such additional rules that can be used to order strings consisting of multiple collating elements.

3.102 Collation Sequence

The relative order of collating elements as determined by the setting of the *LC_COLLATE* category in the current locale. The collation sequence is used for sorting and is determined from the collating weights assigned to each collating element. In the absence of weights, the collation sequence is the order in which collating elements are specified between **order_start** and **order_end** keywords in the *LC_COLLATE* category.

Multi-level sorting is accomplished by assigning elements one or more collation weights, up to the limit {COLL_WEIGHTS_MAX}. On each level, elements may be given the same weight (at the primary level, called an equivalence class; see also Section 3.150 (on page 53)) or be omitted from the sequence. Strings that collate equally using the first assigned weight (primary ordering) are then compared using the next assigned weight (secondary ordering), and so on.

Note: {COLL_WEIGHTS_MAX} is defined in detail in **<limits.h>**.

3.103 Column Position

A unit of horizontal measure related to characters in a line.

It is assumed that each character in a character set has an intrinsic column width independent of any output device. Each printable character in the portable character set has a column width of one. The standard utilities, when used as described in IEEE Std 1003.1-200x, assume that all characters have integral column widths. The column width of a character is not necessarily related to the internal representation of the character (numbers of bits or bytes).

The column position of a character in a line is defined as one plus the sum of the column widths of the preceding characters in the line. Column positions are numbered starting from 1.

3.104 Command

A directive to the shell to perform a particular task.

Note: Shell Commands are defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.9, Shell Commands.

3.105 Command Language Interpreter

An interface that interprets sequences of text input as commands. It may operate on an input stream or it may interactively prompt and read commands from a terminal. It is possible for applications to invoke utilities through a number of interfaces, which are collectively considered to act as command interpreters. The most obvious of these are the *sh* utility and the *system*( ) function, although *popen*( ) and the various forms of *exec* may also be considered to behave as interpreters.

Note: The *sh* utility is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x.

The *system*( ), *popen*( ), and *exec* functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.106 Composite Graphic Symbol

A graphic symbol consisting of a combination of two or more other graphic symbols in a single character position, such as a diacritical mark and a base character.

3.107 Condition Variable

A synchronization object which allows a thread to suspend execution, repeatedly, until some associated predicate becomes true. A thread whose execution is suspended on a condition variable is said to be blocked on the condition variable.

3.108 Connection

An association established between two or more endpoints for the transfer of data

3.109 Connection Mode

The transfer of data in the context of a connection; see also Section 3.110.

3.110 Connectionless Mode

The transfer of data other than in the context of a connection; see also Section 3.109 and Section 3.123 (on page 49).

3.111 Control Character

A character, other than a graphic character, that affects the recording, processing, transmission, or interpretation of text.

3.112 Control Operator

In the shell command language, a token that performs a control function. It is one of the following symbols:

```
&   &&   (   )   ;   ;;   newline   |   ||
```

The end-of-input indicator used internally by the shell is also considered a control operator.

Note: Token Recognition is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.3, Token Recognition.

3.113 Controlling Process

The session leader that established the connection to the controlling terminal. If the terminal subsequently ceases to be a controlling terminal for this session, the session leader ceases to be the controlling process.

3.114 Controlling Terminal

A terminal that is associated with a session. Each session may have at most one controlling terminal associated with it, and a controlling terminal is associated with exactly one session. Certain input sequences from the controlling terminal cause signals to be sent to all processes in the process group associated with the controlling terminal.

Note: The General Terminal Interface is defined in detail in Chapter 11 (on page 183).

3.115 Conversion Descriptor

A per-process unique value used to identify an open codeset conversion.

3.116 Core File

A file of unspecified format that may be generated when a process terminates abnormally.

3.117 CPU Time (Execution Time)

The time spent executing a process or thread, including the time spent executing system services on behalf of that process or thread. If the Threads option is supported, then the value of the CPU-time clock for a process is implementation-defined. With this definition the sum of all the execution times of all the threads in a process might not equal the process execution time, even in a single-threaded process, because implementations may differ in how they account for time during context switches or for other reasons.

3.118 CPU-Time Clock

A clock that measures the execution time of a particular process or thread.

3.119 CPU-Time Timer

A timer attached to a CPU-time clock.

3.120 Current Job

In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities. There is at most one current job; see also Section 3.203 (on page 60).

3.121 Current Working Directory

See *Working Directory* in Section 3.436 (on page 92).

3.122 Cursor Position

The line and column position on the screen denoted by the terminal's cursor.

3.123 Datagram

A unit of data transferred from one endpoint to another in connectionless mode service.

3.124 Data Segment

Memory associated with a process, that can contain dynamically allocated data.

3.125 Deferred Batch Service

A service that is performed as a result of events that are asynchronous with respect to requests.

Note: Once a batch job has been created, it is subject to deferred services.

3.126 Device

A computer peripheral or an object that appears to the application as such.

3.127 Device ID

A non-negative integer used to identify a device.

3.128 Directory

A file that contains directory entries. No two directory entries in the same directory have the same name.

3.129 Directory Entry (or Link)

An object that associates a filename with a file. Several directory entries can associate names with the same file.

3.130 Directory Stream

A sequence of all the directory entries in a particular directory. An open directory stream may be implemented using a file descriptor.

3.131 Disarm (a Timer)

To stop a timer from measuring the passage of time, disabling any future process notifications (until the timer is armed again).

3.132 Display

To output to the user's terminal. If the output is not directed to a terminal, the results are undefined.

3.133 Display Line

A line of text on a physical device or an emulation thereof. Such a line will have a maximum number of characters which can be presented.

Note: This may also be written as ‘‘line on the display’’.

3.134 Dollar Sign

The character `'$'`.

3.135 Dot

In the context of naming files, the filename consisting of a single dot character (`'.'`).

Note: In the context of shell special built-in utilities, see *dot* in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.14, Special Built-In Utilities.

Pathname Resolution is defined in detail in Section 4.11 (on page 98).

3.136 Dot-Dot

The filename consisting solely of two dot characters (`".."`).

Note: Pathname Resolution is defined in detail in Section 4.11 (on page 98).

3.137 Double-Quote

The character `'"'`, also known as *quotation-mark*.

Note: The *double* adjective in this term refers to the two strokes in the character glyph. IEEE Std 1003.1-200x never uses the term double-quote to refer to two apostrophes or quotation marks.

3.138 Downshifting

The conversion of an uppercase character that has a single-character lowercase representation into this lowercase representation.

3.139 Driver

A module that controls data transferred to and received from devices.

Note: Drivers are traditionally written to be a part of the system implementation, although they are frequently written separately from the writing of the implementation. A driver may contain processor-specific code, and therefore be non-portable.

3.140 Effective Group ID

An attribute of a process that is used in determining various permissions, including file access permissions; see also Section 3.188 (on page 58).

3.141 Effective User ID

An attribute of a process that is used in determining various permissions, including file access permissions; see also Section 3.425 (on page 91).

3.142 Eight-Bit Transparency

The ability of a software component to process 8-bit characters without modifying or utilizing any part of the character in a way that is inconsistent with the rules of the current coded character set.

3.143 Empty Directory

A directory that contains, at most, directory entries for dot and dot-dot, and has exactly one link to it, in dot-dot. No other links to the directory may exist. It is unspecified whether an implementation can ever consider the root directory to be empty.

3.144 Empty Line

A line consisting of only a <newline>; see also Section 3.75 (on page 43).

3.145 Empty String (or Null String)

A string whose first byte is a null byte.

3.146 Empty Wide-Character String

A wide-character string whose first element is a null wide-character code.

3.147 Encoding Rule

The rules used to convert between wide-character codes and multi-byte character codes.

Note: Stream Orientation and Encoding Rules are defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.5.2, Stream Orientation and Encoding Rules.

3.148 Entire Regular Expression

The concatenated set of one or more basic regular expressions or extended regular expressions that make up the pattern specified for string selection.

Note: Regular Expressions are defined in detail in Chapter 9 (on page 165).

3.149 Epoch

The time zero hours, zero minutes, zero seconds, on January 1, 1970 Coordinated Universal Time (UTC).

Note: See also Seconds Since the Epoch defined in Section 4.14 (on page 100).

3.150 Equivalence Class

A set of collating elements with the same primary collation weight.

Elements in an equivalence class are typically elements that naturally group together, such as all accented letters based on the same base letter.

The collation order of elements within an equivalence class is determined by the weights assigned on any subsequent levels after the primary weight.

3.151 Era

A locale-specific method for counting and displaying years.

Note: The *LC_TIME* category is defined in detail in Section 7.3.5 (on page 142).

3.152 Event Management

The mechanism that enables applications to register for and be made aware of external events such as data becoming available for reading.

3.153 Executable File

A regular file acceptable as a new process image file by the equivalent of the *exec* family of functions, and thus usable as one form of a utility. The standard utilities described as compilers can produce executable files, but other unspecified methods of producing executable files may also be provided. The internal format of an executable file is unspecified, but a conforming application cannot assume an executable file is a text file.

3.154 Execute

To perform command search and execution actions, as defined in the Shell and Utilities volume of IEEE Std 1003.1-200x; see also Section 3.200 (on page 60).

Note: Command Search and Execution is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.9.1.1, Command Search and Execution.

3.155 Execution Time

See *CPU Time* in Section 3.117 (on page 49).

3.156 Execution Time Monitoring

A set of execution time monitoring primitives that allow online measuring of thread and process execution times.

3.157 Expand

In the shell command language, when not qualified, the act of applying word expansions.

Note: Word Expansions are defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.6, Word Expansions.

3.158 Extended Regular Expression (ERE)

A regular expression (see also Section 3.316 (on page 76)) that is an alternative to the Basic Regular Expression using a more extensive syntax, occasionally used by some utilities.

Note: Extended Regular Expressions are described in detail in Section 9.4 (on page 171).

3.159 Extended Security Controls

Implementation-defined security controls allowed by the file access permission and appropriate privilege (see also Section 3.19 (on page 35)) mechanisms, through which an implementation can support different security policies from those described in IEEE Std 1003.1-200x.

Note: See also Extended Security Controls defined in Section 4.3 (on page 95).

File Access Permissions are defined in detail in Section 4.4 (on page 95).

3.160 Feature Test Macro

A macro used to determine whether a particular set of features is included from a header.

Note: See also the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.2, The Compilation Environment.

3.161 Field

In the shell command language, a unit of text that is the result of parameter expansion, arithmetic expansion, command substitution, or field splitting. During command processing, the resulting fields are used as the command name and its arguments.

Note: Parameter Expansion is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.6.2, Parameter Expansion.

Arithmetic Expansion is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.6.4, Arithmetic Expansion.

Command Substitution is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.6.3, Command Substitution.

Field Splitting is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.6.5, Field Splitting.

For further information on command processing, see the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.9.1, Simple Commands.

3.162 FIFO Special File (or FIFO)

A type of file with the property that data written to such a file is read on a first-in-first-out basis.

Note: Other characteristics of FIFOs are described in the System Interfaces volume of IEEE Std 1003.1-200x, *lseek*( ), *open*( ), *read*( ), and *write*( ).

3.163 File

An object that can be written to, or read from, or both. A file has certain attributes, including access permissions and type. File types include regular file, character special file, block special file, FIFO special file, symbolic link, socket, and directory. Other types of files may be supported by the implementation.

3.164 File Description

See *Open File Description* in Section 3.253 (on page 67).

3.165 File Descriptor

A per-process unique, non-negative integer used to identify an open file for the purpose of file access. The value of a file descriptor is from zero to {OPEN_MAX}. A process can have no more than {OPEN_MAX} file descriptors open simultaneously. File descriptors may also be used to implement message catalog descriptors and directory streams; see also Section 3.253 (on page 67).

Note: {OPEN_MAX} is defined in detail in **<limits.h>**.

3.166 File Group Class

The property of a file indicating access permissions for a process related to the group identification of a process. A process is in the file group class of a file if the process is not in the file owner class and if the effective group ID or one of the supplementary group IDs of the process matches the group ID associated with the file. Other members of the class may be implementation-defined.

3.167 File Mode

An object containing the *file mode bits* and file type of a file.

Note: File mode bits and file types are defined in detail in **<sys/stat.h>**.

3.168 File Mode Bits

A file's file permission bits, set-user-ID-on-execution bit (S_ISUID), and set-group-ID-on-execution bit (S_ISGID).

Note: File Mode Bits are defined in detail in **<sys/stat.h>**.

3.169 Filename

A name consisting of 1 to {NAME_MAX} bytes used to name a file. The characters composing the name may be selected from the set of all character values excluding the slash character and the null byte. The filenames dot and dot-dot have special meaning. A filename is sometimes referred to as a *pathname component*.

Note: Pathname Resolution is defined in detail in Section 4.11 (on page 98).

3.170 Filename Portability

Filenames should be constructed from the portable filename character set because the use of other characters can be confusing or ambiguous in certain contexts. (For example, the use of a colon (':') in a pathname could cause ambiguity if that pathname were included in a *PATH* definition.)

3.171 File Offset

The byte position in the file where the next I/O operation begins. Each open file description associated with a regular file, block special file, or directory has a file offset. A character special file that does not refer to a terminal device may have a file offset. There is no file offset specified for a pipe or FIFO.

3.172 File Other Class

The property of a file indicating access permissions for a process related to the user and group identification of a process. A process is in the file other class of a file if the process is not in the file owner class or file group class.

3.173 File Owner Class

The property of a file indicating access permissions for a process related to the user identification of a process. A process is in the file owner class of a file if the effective user ID of the process matches the user ID of the file.

3.174 File Permission Bits

Information about a file that is used, along with other information, to determine whether a process has read, write, or execute/search permission to a file. The bits are divided into three parts: owner, group, and other. Each part is used with the corresponding file class of processes. These bits are contained in the file mode.

Note: File modes are defined in detail in **<sys/stat.h>**.

File Access Permissions are defined in detail in Section 4.4 (on page 95).

3.175 File Serial Number

A per-file system unique identifier for a file.

3.176 File System

A collection of files and certain of their attributes. It provides a name space for file serial numbers referring to those files.

3.177 File Type

See *File* in Section 3.163 (on page 55).

3.178 Filter

A command whose operation consists of reading data from standard input or a list of input files and writing data to standard output. Typically, its function is to perform some transformation on the data stream.

3.179 First Open (of a File)

When a process opens a file that is not currently an open file within any process.

3.180 Flow Control

The mechanism employed by a communications provider that constrains a sending entity to wait until the receiving entities can safely receive additional data without loss.

3.181 Foreground Job

See *Foreground Process Group* in Section 3.183.

3.182 Foreground Process

A process that is a member of a foreground process group.

3.183 Foreground Process Group (or Foreground Job)

A process group whose member processes have certain privileges, denied to processes in background process groups, when accessing their controlling terminal. Each session that has established a connection with a controlling terminal has at most one process group of the session as the foreground process group of that controlling terminal.

Note: The General Terminal Interface is defined in detail in Chapter 11.

3.184 Foreground Process Group ID

The process group ID of the foreground process group.

3.185 Form-Feed Character (<form-feed>)

A character that in the output stream indicates that printing should start on the next page of an output device. It is the character designated by `'\f'` in the C language. If the <form-feed> is not the first character of an output line, the result is unspecified. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the movement to the next page.

3.186 Graphic Character

A member of the **graph** character class of the current locale.

Note: The **graph** character class is defined in detail in Section 7.3.1 (on page 122).

3.187 Group Database

A system database of implementation-defined format that contains at least the following information for each group ID:

- Group name
- Numerical group ID
- List of users allowed in the group

The list of users allowed in the group is used by the *newgrp* utility.

Note: The *newgrp* utility is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x.

3.188 Group ID

A non-negative integer, which can be contained in an object of type **gid_t**, that is used to identify a group of system users. Each system user is a member of at least one group. When the identity of a group is associated with a process, a group ID value is referred to as a real group ID, an effective group ID, one of the supplementary group IDs, or a saved set-group-ID.

3.189 Group Name

A string that is used to identify a group; see also Section 3.187. To be portable across conforming systems, the value is composed of characters from the portable filename character set. The hyphen should not be used as the first character of a portable group name.

3.190 Hard Limit

A system resource limitation that may be reset to a lesser or greater limit by a privileged process. A non-privileged process is restricted to only lowering its hard limit.

3.191 Hard Link

The relationship between two directory entries that represent the same file; see also Section 3.129 (on page 50). The result of an execution of the *ln* utility (without the −**s** option) or the *link*( ) function. This term is contrasted against symbolic link; see also Section 3.372 (on page 83).

3.192 Home Directory

The directory specified by the *HOME* environment variable.

3.193 Host Byte Order

The arrangement of bytes in any **int** type when using a specific machine architecture.

Note: Two common methods of byte ordering are big-endian and little-endian. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage or transmission of binary data in which the least significant byte is placed first, with the rest in ascending order. See also Section 4.8 (on page 97).

3.194 Incomplete Line

A sequence of one or more non-<newline>s at the end of the file.

3.195 Inf

A value representing +infinity or a value representing –infinity that can be stored in a floating type. Not all systems support the Inf values.

3.196 Instrumented Application

An application that contains at least one call to the trace point function *posix_trace_event*( ). Each process of an instrumented application has a mapping of trace event names to trace event type identifiers. This mapping is used by the trace stream that is created for that process.

3.197 Interactive Shell

A processing mode of the shell that is suitable for direct user interaction.

3.198 Internationalization

The provision within a computer program of the capability of making itself adaptable to the requirements of different native languages, local customs, and coded character sets.

3.199 Interprocess Communication

A functionality enhancement to add a high-performance, deterministic interprocess communication facility for local communication.

3.200 Invoke

To perform command search and execution actions, except that searching for shell functions and special built-in utilities is suppressed; see also Section 3.154 (on page 53).

Note: Command Search and Execution is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.9.1.1, Command Search and Execution.

3.201 Job

A set of processes, comprising a shell pipeline, and any processes descended from it, that are all in the same process group.

Note: See also the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.9.2, Pipelines.

3.202 Job Control

A facility that allows users selectively to stop (suspend) the execution of processes and continue (resume) their execution at a later point. The user typically employs this facility via the interactive interface jointly supplied by the terminal I/O driver and a command interpreter.

3.203 Job Control Job ID

A handle that is used to refer to a job. The job control job ID can be any of the forms shown in the following table:

Table 3-1 Job Control Job ID Formats

Job Control Job ID	Meaning
%%	Current job.
%+	Current job.
%–	Previous job.
%*n*	Job number *n*.
%*string*	Job whose command begins with *string*.
%?*string*	Job whose command contains *string*.

3.204 Last Close (of a File)

When a process closes a file, resulting in the file not being an open file within any process.

3.205 Line

A sequence of zero or more non-<newline>s plus a terminating <newline>.

3.206 Linger

A period of time before terminating a connection, to allow outstanding data to be transferred.

3.207 Link

See *Directory Entry* in Section 3.129 (on page 50).

3.208 Link Count

The number of directory entries that refer to a particular file.

3.209 Local Customs

The conventions of a geographical area or territory for such things as date, time, and currency formats.

3.210 Local Interprocess Communication (Local IPC)

The transfer of data between processes in the same system. |

3.211 Locale |

The definition of the subset of a user's environment that depends on language and cultural conventions. |

Note: Locales are defined in detail in Chapter 7 (on page 119).

3.212 Localization

The process of establishing information within a computer system specific to the operation of particular native languages, local customs, and coded character sets.

3.213 Login

The unspecified activity by which a user gains access to the system. Each login is associated with exactly one login name.

3.214 Login Name

A user name that is associated with a login.

3.215 Map

To create an association between a page-aligned range of the address space of a process and some memory object, such that a reference to an address in that range of the address space results in a reference to the associated memory object. The mapped memory object is not necessarily memory-resident.

3.216 Marked Message

A STREAMs message on which a certain flag is set. Marking a message gives the application protocol-specific information. An application can use *ioctl*( ) to determine whether a given message is marked.

Note: The *ioctl*( ) function is defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.217 Matched

A state applying to a sequence of zero or more characters when the characters in the sequence correspond to a sequence of characters defined by a basic regular expression or extended regular expression pattern.

Note: Regular Expressions are defined in detail in Chapter 9 (on page 165).

3.218 Memory Mapped Files

A facility to allow applications to access files as part of the address space.

3.219 Memory Object

One of:

- A file (see Section 3.163 (on page 55))
- A shared memory object (see Section 3.340 (on page 79))
- A typed memory object (see Section 3.418 (on page 90))

When used in conjunction with *mmap*( ), a memory object appears in the address space of the calling process.

Note: The *mmap*( ) function is defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.220 Memory-Resident

The process of managing the implementation in such a way as to provide an upper bound on memory access times.

3.221 Message

In the context of programmatic message passing, information that can be transferred between processes or threads by being added to and removed from a message queue. A message consists of a fixed-size message buffer.

3.222 Message Catalog

In the context of providing natural language messages to the user, a file or storage area containing program messages, command prompts, and responses to prompts for a particular native language, territory, and codeset.

3.223 Message Catalog Descriptor

In the context of providing natural language messages to the user, a per-process unique value used to identify an open message catalog. A message catalog descriptor may be implemented using a file descriptor.

3.224 Message Queue

In the context of programmatic message passing, an object to which messages can be added and removed. Messages may be removed in the order in which they were added or in priority order.

3.225 Mode

A collection of attributes that specifies a file's type and its access permissions.

Note: File Access Permissions are defined in detail in Section 4.4 (on page 95).

3.226 Monotonic Clock

A clock whose value cannot be set via *clock_settime*( ) and which cannot have negative clock jumps.

3.227 Mount Point

Either the system root directory or a directory for which the *st_dev* field of structure **stat** differs from that of its parent directory.

Note: The **stat** structure is defined in detail in **<sys/stat.h>**.

3.228 Multi-Character Collating Element

A sequence of two or more characters that collate as an entity. For example, in some coded character sets, an accented character is represented by a non-spacing accent, followed by the letter. Other examples are the Spanish elements *ch* and *ll*.

3.229 Mutex

A synchronization object used to allow multiple threads to serialize their access to shared data. The name derives from the capability it provides; namely, mutual-exclusion. The thread that has locked a mutex becomes its owner and remains the owner until that same thread unlocks the mutex.

3.230 Name

In the shell command language, a word consisting solely of underscores, digits, and alphabetics from the portable character set. The first character of a name is not a digit.

Note: The portable character set is defined in detail in Section 6.1 (on page 111).

3.231 Named STREAM

A STREAMS-based file descriptor that is attached to a name in the file system name space. All subsequent operations on the named STREAM act on the STREAM that was associated with the file descriptor until the name is disassociated from the STREAM.

3.232 NaN (Not a Number)

A set of values that may be stored in a floating type but that are neither Inf nor valid floating-point numbers. Not all systems support NaN values.

3.233 Native Language

A computer user's spoken or written language, such as American English, British English, Danish, Dutch, French, German, Italian, Japanese, Norwegian, or Swedish.

3.234 Negative Response

An input string that matches one of the responses acceptable to the *LC_MESSAGES* category keyword **noexpr**, matching an extended regular expression in the current locale.

Note: The *LC_MESSAGES* category is defined in detail in Section 7.3.6 (on page 148).

3.235 Network

A collection of interconnected hosts.

Note: The term network in IEEE Std 1003.1-200x is used to refer to the network of hosts. The term batch system is used to refer to the network of batch servers.

3.236 Network Address

A network-visible identifier used to designate specific endpoints in a network. Specific endpoints on host systems have addresses, and host systems may also have addresses.

3.237 Network Byte Order

The way of representing any **int** type such that, when transmitted over a network via a network endpoint, the **int** type is transmitted as an appropriate number of octets with the most significant octet first, followed by any other octets in descending order of significance.

Note: This order is more commonly known as big-endian ordering. See also Section 4.8 (on page 97).

3.238 Newline Character (<newline>)

A character that in the output stream indicates that printing should start at the beginning of the next line. It is the character designated by `'\n'` in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the movement to the next line.

3.239 Nice Value

A number used as advice to the system to alter process scheduling. Numerically smaller values give a process additional preference when scheduling a process to run. Numerically larger values reduce the preference and make a process less likely to run. Typically, a process with a smaller nice value runs to completion more quickly than an equivalent process with a higher nice value. The symbol {NZERO} specifies the default nice value of the system.

3.240 Non-Blocking

A property of an open file description that causes function calls involving it to return without delay when it is detected that the requested action associated with the function call cannot be completed without unknown delay.

Note: The exact semantics are dependent on the type of file associated with the open file description. For data reads from devices such as ttys and FIFOs, this property causes the read to return immediately when no data was available. Similarly, for writes, it causes the call to return immediately when the thread would otherwise be delayed in the write operation; for example, because no space was available. For networking, it causes functions not to await protocol events (for example, acknowledgements) to occur. See also the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.10.7, Socket I/O Mode.

3.241 Non-Spacing Characters

A character, such as a character representing a diacritical mark in the ISO/IEC 6937:1994 standard coded character set, which is used in combination with other characters to form composite graphic symbols.

3.242 NUL

A character with all bits set to zero.

3.243 Null Byte

A byte with all bits set to zero.

3.244 Null Pointer

The value that is obtained by converting the number 0 into a pointer; for example, (**void** *) 0. The C language guarantees that this value does not match that of any legitimate pointer, so it is used by many functions that return pointers to indicate an error.

3.245 Null String

See *Empty String* in Section 3.145 (on page 52).

3.246 Null Wide-Character Code

A wide-character code with all bits set to zero.

3.247 Number Sign

The character `'#'`, also known as *hash sign*.

3.248 Object File

A regular file containing the output of a compiler, formatted as input to a linkage editor for linking with other object files into an executable form. The methods of linking are unspecified and may involve the dynamic linking of objects at runtime. The internal format of an object file is unspecified, but a conforming application cannot assume an object file is a text file.

3.249 Octet

Unit of data representation that consists of eight contiguous bits.

3.250 Offset Maximum

An attribute of an open file description representing the largest value that can be used as a file offset.

3.251 Opaque Address

An address such that the entity making use of it requires no details about its contents or format.

3.252 Open File

A file that is currently associated with a file descriptor.

3.253 Open File Description

A record of how a process or group of processes is accessing a file. Each file descriptor refers to exactly one open file description, but an open file description can be referred to by more than one file descriptor. A file offset, file status, and file access modes are attributes of an open file description.

3.254 Operand

An argument to a command that is generally used as an object supplying information to a utility necessary to complete its processing. Operands generally follow the options in a command line.

Note: Utility Argument Syntax is defined in detail in Section 12.1 (on page 197).

3.255 Operator

In the shell command language, either a control operator or a redirection operator.

3.256 Option

An argument to a command that is generally used to specify changes in the utility's default behavior.

Note: Utility Argument Syntax is defined in detail in Section 12.1 (on page 197).

3.257 Option-Argument

A parameter that follows certain options. In some cases an option-argument is included within the same argument string as the option—in most cases it is the next argument.

Note: Utility Argument Syntax is defined in detail in Section 12.1 (on page 197).

3.258 Orientation

A stream has one of three orientations: unoriented, byte-oriented, or wide-oriented.

Note: For further information, see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.5.2, Stream Orientation and Encoding Rules.

3.259 Orphaned Process Group

A process group in which the parent of every member is either itself a member of the group or is not a member of the group's session.

3.260 Page

The granularity of process memory mapping or locking.

Physical memory and memory objects can be mapped into the address space of a process on page boundaries and in integral multiples of pages. Process address space can be locked into memory (made memory-resident) on page boundaries and in integral multiples of pages.

3.261 Page Size

The size, in bytes, of the system unit of memory allocation, protection, and mapping. On systems that have segment rather than page-based memory architectures, the term page means a segment.

3.262 Parameter

In the shell command language, an entity that stores values. There are three types of parameters: variables (named parameters), positional parameters, and special parameters. Parameter expansion is accomplished by introducing a parameter with the `'$'` character.

Note: See also the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.5, Parameters and Variables.

In the C language, an object declared as part of a function declaration or definition that acquires a value on entry to the function, or an identifier following the macro name in a function-like macro definition.

3.263 Parent Directory

When discussing a given directory, the directory that both contains a directory entry for the given directory and is represented by the pathname dot-dot in the given directory.

When discussing other types of files, a directory containing a directory entry for the file under discussion.

This concept does not apply to dot and dot-dot.

3.264 Parent Process

The process which created (or inherited) the process under discussion.

3.265 Parent Process ID

An attribute of a new process identifying the parent of the process. The parent process ID of a process is the process ID of its creator, for the lifetime of the creator. After the creator's lifetime has ended, the parent process ID is the process ID of an implementation-defined system process.

3.266 Pathname

A character string that is used to identify a file. In the context of IEEE Std 1003.1-200x, a pathname consists of, at most, {PATH_MAX} bytes, including the terminating null byte. It has an optional beginning slash, followed by zero or more filenames separated by slashes. A pathname may optionally contain one or more trailing slashes. Multiple successive slashes are considered to be the same as one slash.

Note: Pathname Resolution is defined in detail in Section 4.11 (on page 98).

3.267 Pathname Component

See *Filename* in Section 3.169 (on page 56).

3.268 Path Prefix

A pathname, with an optional ending slash, that refers to a directory.

3.269 Pattern

A sequence of characters used either with regular expression notation or for pathname expansion, as a means of selecting various character strings or pathnames, respectively.

Note: Regular Expressions are defined in detail in Chapter 9 (on page 165).

See also the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.6.6, Pathname Expansion.

The syntaxes of the two types of patterns are similar, but not identical; IEEE Std 1003.1-200x always indicates the type of pattern being referred to in the immediate context of the use of the term.

3.270 Period

The character `'.'`. The term period is contrasted with dot (see also Section 3.135 (on page 51)), which is used to describe a specific directory entry.

3.271 Permissions

Attributes of an object that determine the privilege necessary to access or manipulate the object.

Note: File Access Permissions are defined in detail in Section 4.4 (on page 95).

3.272 Persistence

A mode for semaphores, shared memory, and message queues requiring that the object and its state (including data, if any) are preserved after the object is no longer referenced by any process.

Persistence of an object does not imply that the state of the object is maintained across a system crash or a system reboot.

3.273 Pipe

An object accessed by one of the pair of file descriptors created by the *pipe*( ) function. Once created, the file descriptors can be used to manipulate it, and it behaves identically to a FIFO special file when accessed in this way. It has no name in the file hierarchy.

Note: The *pipe*( ) function is defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.274 Polling

A scheduling scheme whereby the local process periodically checks until the prespecified events (for example, read, write) have occurred.

3.275 Portable Character Set

The collection of characters that are required to be present in all locales supported by conforming systems.

Note: The portable character set is defined in detail in Section 6.1 (on page 111).

This term is contrasted against the smaller *portable filename character set*; see also Section 3.276.

3.276 Portable Filename Character Set

The set of characters from which portable filenames are constructed.

```
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
a b c d e f g h i j k l m n o p q r s t u v w x y z
0 1 2 3 4 5 6 7 8 9 . _ -
```

The last three characters are the period, underscore, and hyphen characters, respectively.

3.277 Positional Parameter

In the shell command language, a parameter denoted by a single digit or one or more digits in curly braces.

Note: For further information, see the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.5.1, Positional Parameters.

3.278 Preallocation

The reservation of resources in a system for a particular use.

Preallocation does not imply that the resources are immediately allocated to that use, but merely indicates that they are guaranteed to be available in bounded time when needed.

3.279 Preempted Process (or Thread)

A running thread whose execution is suspended due to another thread becoming runnable at a higher priority.

3.280 Previous Job

In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities if the current job exits. There is at most one previous job; see also Section 3.203 (on page 60).

3.281 Printable Character

One of the characters included in the **print** character classification of the *LC_CTYPE* category in the current locale.

Note: The *LC_CTYPE* category is defined in detail in Section 7.3.1 (on page 122).

3.282 Printable File

A text file consisting only of the characters included in the **print** and **space** character classifications of the *LC_CTYPE* category and the <backspace>, all in the current locale.

Note: The *LC_CTYPE* category is defined in detail in Section 7.3.1 (on page 122).

3.283 Priority

A non-negative integer associated with processes or threads whose value is constrained to a range defined by the applicable scheduling policy. Numerically higher values represent higher priorities.

3.284 Priority Band

The queuing order applied to normal priority STREAMS messages. High priority STREAMS messages are not grouped by priority bands. The only differentiation made by the STREAMS mechanism is between zero and non-zero bands, but specific protocol modules may differentiate between priority bands.

3.285 Priority Inversion

A condition in which a thread that is not voluntarily suspended (waiting for an event or time delay) is not running while a lower priority thread is running. Such blocking of the higher priority thread is often caused by contention for a shared resource.

3.286 Priority Scheduling

A performance and determinism improvement facility to allow applications to determine the order in which threads that are ready to run are granted access to processor resources.

3.287 Priority-Based Scheduling

Scheduling in which the selection of a running thread is determined by the priorities of the runnable processes or threads.

3.288 Privilege

See *Appropriate Privileges* in Section 3.19 (on page 35).

3.289 Process

An address space with one or more threads executing within that address space, and the required system resources for those threads.

Note: Many of the system resources defined by IEEE Std 1003.1-200x are shared among all of the threads within a process. These include the process ID, the parent process ID, process group ID, session membership, real, effective, and saved-set user ID, real, effective, and saved-set group ID, supplementary group IDs, current working directory, root directory, file mode creation mask, and file descriptors.

3.290 Process Group

A collection of processes that permits the signaling of related processes. Each process in the system is a member of a process group that is identified by a process group ID. A newly created process joins the process group of its creator.

3.291 Process Group ID

The unique positive integer identifier representing a process group during its lifetime.

Note: See also Process Group ID Reuse defined in Section 4.12 (on page 99).

3.292 Process Group Leader

A process whose process ID is the same as its process group ID.

3.293 Process Group Lifetime

A period of time that begins when a process group is created and ends when the last remaining process in the group leaves the group, due either to the end of the last process' lifetime or to the last remaining process calling the *setsid*( ) or *setpgid*( ) functions.

Note: The *setsid*( ) and *setpgid*( ) functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.294 Process ID

The unique positive integer identifier representing a process during its lifetime.

Note: See also Process ID Reuse defined in Section 4.12 (on page 99).

3.295 Process Lifetime

The period of time that begins when a process is created and ends when its process ID is returned to the system. After a process is created with a *fork*( ) function, it is considered active. At least one thread of control and address space exist until it terminates. It then enters an inactive state where certain resources may be returned to the system, although some resources, such as the process ID, are still in use. When another process executes a *wait*( ), *waitid*( ), or *waitpid*( ) function for an inactive process, the remaining resources are returned to the system. The last resource to be returned to the system is the process ID. At this time, the lifetime of the process ends.

Note: The *fork*( ), *wait*( ), *waitid*( ), and *waitpid*( ) functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.296 Process Memory Locking

A performance improvement facility to bind application programs into the high-performance random access memory of a computer system. This avoids potential latencies introduced by the operating system in storing parts of a program that were not recently referenced on secondary memory devices.

3.297 Process Termination

There are two kinds of process termination:

1. Normal termination occurs by a return from *main*( ) or when requested with the *exit*( ) or *_exit*( ) functions.
2. Abnormal termination occurs when requested by the *abort*( ) function or when some signals are received.

Note: The *_exit*( ), *abort*( ), and *exit*( ) functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.298 Process-To-Process Communication

The transfer of data between processes.

3.299 Process Virtual Time

The measurement of time in units elapsed by the system clock while a process is executing.

3.300 Program

A prepared sequence of instructions to the system to accomplish a defined task. The term program in IEEE Std 1003.1-200x encompasses applications written in the Shell Command Language, complex utility input languages (for example, *awk*, *lex*, *sed*, and so on), and high-level languages.

3.301 Protocol

A set of semantic and syntactic rules for exchanging information.

3.302 Pseudo-Terminal

A facility that provides an interface that is identical to the terminal subsystem. A pseudo-terminal is composed of two devices: the *master device* and a *slave device*. The slave device provides processes with an interface that is identical to the terminal interface, although there need not be hardware behind that interface. Anything written on the master device is presented to the slave as an input and anything written on the slave device is presented as an input on the master side.

3.303 Radix Character

The character that separates the integer part of a number from the fractional part.

3.304 Read-Only File System

A file system that has implementation-defined characteristics restricting modifications.

Note: File Times Update is described in detail in Section 4.7 (on page 96).

3.305 Read-Write Lock

Multiple readers, single writer (read-write) locks allow many threads to have simultaneous read-only access to data while allowing only one thread to have write access at any given time. They are typically used to protect data that is read-only more frequently than it is changed.

Read-write locks can be used to synchronize threads in the current process and other processes if they are allocated in memory that is writable and shared among the cooperating processes and have been initialized for this behavior.

3.306 Real Group ID

The attribute of a process that, at the time of process creation, identifies the group of the user who created the process; see also Section 3.188 (on page 58).

3.307 Real Time

Time measured as total units elapsed by the system clock without regard to which thread is executing.

3.308 Realtime Signal Extension

A determinism improvement facility to enable asynchronous signal notifications to an application to be queued without impacting compatibility with the existing signal functions.

3.309 Real User ID

The attribute of a process that, at the time of process creation, identifies the user who created the process; see also Section 3.425 (on page 91).

3.310 Record

A collection of related data units or words which is treated as a unit. |

3.311 Redirection |

In the shell command language, a method of associating files with the input or output of commands. |

Note: For further information, see the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.7, Redirection.

3.312 Redirection Operator

In the shell command language, a token that performs a redirection function. It is one of the following symbols:

```
<     >     >|     <<     >>     <&     >&     <<-     <>
```

3.313 Reentrant Function

A function whose effect, when called by two or more threads, is guaranteed to be as if the threads each executed the function one after another in an undefined order, even if the actual execution is interleaved.

3.314 Referenced Shared Memory Object

A shared memory object that is open or has one or more mappings defined on it.

3.315 Refresh

To ensure that the information on the user's terminal screen is up-to-date.

3.316 Regular Expression

A pattern that selects specific strings from a set of character strings.

Note: Regular Expressions are described in detail in Chapter 9 (on page 165).

3.317 Region

In the context of the address space of a process, a sequence of addresses.

In the context of a file, a sequence of offsets.

3.318 Regular File

A file that is a randomly accessible sequence of bytes, with no further structure imposed by the system.

3.319 Relative Pathname

A pathname not beginning with a slash.

Note: Pathname Resolution is defined in detail in Section 4.11 (on page 98).

3.320 Relocatable File

A file holding code or data suitable for linking with other object files to create an executable or a shared object file.

3.321 Relocation

The process of connecting symbolic references with symbolic definitions. For example, when a program calls a function, the associated call instruction transfers control to the proper destination address at execution.

3.322 Requested Batch Service

A service that is either rejected or performed prior to a response from the service to the requester.

3.323 (Time) Resolution

The minimum time interval that a clock can measure or whose passage a timer can detect.

3.324 Root Directory

A directory, associated with a process, that is used in pathname resolution for pathnames that begin with a slash.

3.325 Runnable Process (or Thread)

A thread that is capable of being a running thread, but for which no processor is available.

3.326 Running Process (or Thread)

A thread currently executing on a processor. On multi-processor systems there may be more than one such thread in a system at a time.

3.327 Saved Resource Limits

An attribute of a process that provides some flexibility in the handling of unrepresentable resource limits, as described in the *exec* family of functions and *setrlimit*( ).

Note: The *exec* and *setrlimit*( ) functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.328 Saved Set-Group-ID

An attribute of a process that allows some flexibility in the assignment of the effective group ID attribute, as described in the *exec* family of functions and *setgid*( ).

Note: The *exec* and *setgid*( ) functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.329 Saved Set-User-ID

An attribute of a process that allows some flexibility in the assignment of the effective user ID attribute, as described in the *exec* family of functions and *setuid*( ).

Note: The *exec* and *setuid*( ) functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.330 Scheduling

The application of a policy to select a runnable process or thread to become a running process or thread, or to alter one or more of the thread lists.

3.331 Scheduling Allocation Domain

The set of processors on which an individual thread can be scheduled at any given time.

3.332 Scheduling Contention Scope

A property of a thread that defines the set of threads against which that thread competes for resources.

For example, in a scheduling decision, threads sharing scheduling contention scope compete for processor resources. In IEEE Std 1003.1-200x, a thread has scheduling contention scope of either PTHREAD_SCOPE_SYSTEM or PTHREAD_SCOPE_PROCESS.

3.333 Scheduling Policy

A set of rules that is used to determine the order of execution of processes or threads to achieve some goal.

Note: Scheduling Policy is defined in detail in Section 4.13 (on page 99).

3.334 Screen

A rectangular region of columns and lines on a terminal display. A screen may be a portion of a physical display device or may occupy the entire physical area of the display device.

3.335 Scroll

To move the representation of data vertically or horizontally relative to the terminal screen. There are two types of scrolling:

1. The cursor moves with the data.
2. The cursor remains stationary while the data moves.

3.336 Semaphore

A minimum synchronization primitive to serve as a basis for more complex synchronization mechanisms to be defined by the application program.

Note: Semaphores are defined in detail in Section 4.15 (on page 100).

3.337 Session

A collection of process groups established for job control purposes. Each process group is a member of a session. A process is considered to be a member of the session of which its process group is a member. A newly created process joins the session of its creator. A process can alter its session membership; see *setsid*( ). There can be multiple process groups in the same session.

Note: The *setsid*( ) function is defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.338 Session Leader

A process that has created a session.

Note: For further information, see the *setsid*( ) function defined in the System Interfaces volume of IEEE Std 1003.1-200x.

3.339 Session Lifetime

The period between when a session is created and the end of the lifetime of all the process groups that remain as members of the session.

3.340 Shared Memory Object

An object that represents memory that can be mapped concurrently into the address space of more than one process.

3.341 Shell

A program that interprets sequences of text input as commands. It may operate on an input stream or it may interactively prompt and read commands from a terminal.

3.342 Shell, the

The Shell Command Language Interpreter; a specific instance of a shell.

Note: For further information, see the *sh* utility defined in the Shell and Utilities volume of IEEE Std 1003.1-200x.

3.343 Shell Script

A file containing shell commands. If the file is made executable, it can be executed by specifying its name as a simple command. Execution of a shell script causes a shell to execute the commands within the script. Alternatively, a shell can be requested to execute the commands in a shell script by specifying the name of the shell script as the operand to the *sh* utility.

Note: Simple Commands are defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.9.1, Simple Commands.

The *sh* utility is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x.

3.344 Signal

A mechanism by which a process or thread may be notified of, or affected by, an event occurring in the system. Examples of such events include hardware exceptions and specific actions by processes. The term signal is also used to refer to the event itself.

3.345 Signal Stack

Memory established for a thread, in which signal handlers catching signals sent to that thread are executed.

3.346 Single-Quote

The character `'''`, also known as *apostrophe*.

3.347 Slash

The character `'/'`, also known as *solidus*.

3.348 Socket

A file of a particular type that is used as a communications endpoint for process-to-process communication as described in the System Interfaces volume of IEEE Std 1003.1-200x.

3.349 Socket Address

An address associated with a socket or remote endpoint, including an address family identifier and addressing information specific to that address family. The address may include multiple parts, such as a network address associated with a host system and an identifier for a specific endpoint.

3.350 Soft Limit

A resource limitation established for each process that the process may set to any value less than or equal to the hard limit. |

3.351 Source Code |

When dealing with the Shell Command Language, input to the command language interpreter. | The term shell script is synonymous with this meaning.

When dealing with an ISO/IEC-conforming programming language, source code is input to a compiler conforming to that ISO/IEC standard.

Source code also refers to the input statements prepared for the following standard utilities: *awk*, *bc*, *ed*, *lex*, *localedef*, *make*, *sed*, and *yacc*.

Source code can also refer to a collection of sources meeting any or all of these meanings.

Note: The *awk*, *bc*, *ed*, *lex*, *localedef*, *make*, *sed*, and *yacc* utilities are defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x.

3.352 Space Character (<space>)

The character defined in the portable character set as <space>. The <space> is a member of the **space** character class of the current locale, but represents the single character, and not all of the possible members of the class; see also Section 3.431 (on page 92).

3.353 Spawn

A process creation primitive useful for systems that have difficulty with *fork*( ) and as an efficient replacement for *fork*( )/*exec*.

3.354 Special Built-In

See *Built-In Utility* in Section 3.83 (on page 44).

3.355 Special Parameter

In the shell command language, a parameter named by a single character from the following list:

```
*    @    #    ?    !    -    $    0
```

Note: For further information, see the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.5.2, Special Parameters.

3.356 Spin Lock

A synchronization object used to allow multiple threads to serialize their access to shared data.

3.357 Sporadic Server

A scheduling policy for threads and processes that reserves a certain amount of execution capacity for processing aperiodic events at a given priority level.

3.358 Standard Error

An output stream usually intended to be used for diagnostic messages.

3.359 Standard Input

An input stream usually intended to be used for primary data input.

3.360 Standard Output

An output stream usually intended to be used for primary data output.

3.361 Standard Utilities

The utilities described in the Shell and Utilities volume of IEEE Std 1003.1-200x.

3.362 Stream

Appearing in lowercase, a stream is a file access object that allows access to an ordered sequence of characters, as described by the ISO C standard. Such objects can be created by the *fdopen*( ), *fopen*( ), or *popen*( ) functions, and are associated with a file descriptor. A stream provides the additional services of user-selectable buffering and formatted input and output; see also Section 3.363.

Note: For further information, see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.5, Standard I/O Streams.

The *fdopen*( ), *fopen*( ), or *popen*( ) functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.363 STREAM

Appearing in uppercase, STREAM refers to a full duplex connection between a process and an open device or pseudo-device. It optionally includes one or more intermediate processing modules that are interposed between the process end of the STREAM and the device driver (or pseudo-device driver) end of the STREAM; see also Section 3.362.

Note: For further information, see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.6, STREAMS.

3.364 STREAM End

The STREAM end is the driver end of the STREAM and is also known as the downstream end of the STREAM.

3.365 STREAM Head

The STREAM head is the beginning of the STREAM and is at the boundary between the system and the application process. This is also known as the upstream end of the STREAM.

3.366 STREAMS Multiplexor

A driver with multiple STREAMS connected to it. Multiplexing with STREAMS connected above is referred to as N-to-1, or *upper multiplexing*. Multiplexing with STREAMS connected below is referred to as 1-to-N or *lower multiplexing*.

3.367 String

A contiguous sequence of bytes terminated by and including the first null byte.

3.368 Subshell

A shell execution environment, distinguished from the main or current shell execution environment.

Note: For further information, see the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.12, Shell Execution Environment.

3.369 Successfully Transferred

For a write operation to a regular file, when the system ensures that all data written is readable on any subsequent open of the file (even one that follows a system or power failure) in the absence of a failure of the physical storage medium.

For a read operation, when an image of the data on the physical storage medium is available to the requesting process.

3.370 Supplementary Group ID

An attribute of a process used in determining file access permissions. A process has up to {NGROUPS_MAX} supplementary group IDs in addition to the effective group ID. The supplementary group IDs of a process are set to the supplementary group IDs of the parent process when the process is created.

3.371 Suspended Job

A job that has received a SIGSTOP, SIGTSTP, SIGTTIN, or SIGTTOU signal that caused the process group to stop. A suspended job is a background job, but a background job is not necessarily a suspended job.

3.372 Symbolic Link

A type of file with the property that when the file is encountered during pathname resolution, a string stored by the file is used to modify the pathname resolution. The stored string has a length of {SYMLINK_MAX} bytes or fewer.

Note: Pathname Resolution is defined in detail in Section 4.11 (on page 98).

3.373 Synchronized Input and Output

A determinism and robustness improvement mechanism to enhance the data input and output mechanisms, so that an application can ensure that the data being manipulated is physically present on secondary mass storage devices.

3.374 Synchronized I/O Completion

The state of an I/O operation that has either been successfully transferred or diagnosed as unsuccessful.

3.375 Synchronized I/O Data Integrity Completion

For read, when the operation has been completed or diagnosed if unsuccessful. The read is complete only when an image of the data has been successfully transferred to the requesting process. If there were any pending write requests affecting the data to be read at the time that the synchronized read operation was requested, these write requests are successfully transferred prior to reading the data.

For write, when the operation has been completed or diagnosed if unsuccessful. The write is complete only when the data specified in the write request is successfully transferred and all file system information required to retrieve the data is successfully transferred.

File attributes that are not necessary for data retrieval (access time, modification time, status change time) need not be successfully transferred prior to returning to the calling process.

3.376 Synchronized I/O File Integrity Completion

Identical to a synchronized I/O data integrity completion with the addition that all file attributes relative to the I/O operation (including access time, modification time, status change time) are successfully transferred prior to returning to the calling process.

3.377 Synchronized I/O Operation

An I/O operation performed on a file that provides the application assurance of the integrity of its data and files.

3.378 Synchronous I/O Operation

An I/O operation that causes the thread requesting the I/O to be blocked from further use of the processor until that I/O operation completes.

Note: A synchronous I/O operation does not imply synchronized I/O data integrity completion or synchronized I/O file integrity completion.

3.379 Synchronously-Generated Signal

A signal that is attributable to a specific thread.

For example, a thread executing an illegal instruction or touching invalid memory causes a synchronously-generated signal. Being synchronous is a property of how the signal was generated and not a property of the signal number.

3.380 System

An implementation of IEEE Std 1003.1-200x.

3.381 System Crash

An interval initiated by an unspecified circumstance that causes all processes (possibly other than special system processes) to be terminated in an undefined manner, after which any changes to the state and contents of files created or written to by an application prior to the interval are undefined, except as required elsewhere in IEEE Std 1003.1-200x.

3.382 System Console

An implementation-defined device that receives messages sent by the *syslog*( ) function, and the *fmtmsg*( ) function when the MM_CONSOLE flat is set.

Note: The *syslog*( ) and *fmtmsg*( ) functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.383 System Databases

An implementation provides two system databases.

The *group database* contains the following information for each group:

1. Group name
2. Numerical group ID
3. List of all users allowed in the group

The *user database* contains the following information for each user:

1. User name
2. Numerical user ID
3. Numerical group ID
4. Initial working directory
5. Initial user program

If the initial user program field is null, the system default is used. If the initial working directory field is null, the interpretation of that field is implementation-defined. These databases may contain other fields that are unspecified by IEEE Std 1003.1-200x.

3.384 System Documentation

All documentation provided with an implementation except for the conformance document. Electronically distributed documents for an implementation are considered part of the system documentation.

3.385 System Process

An implementation-defined object, other than a process executing an application, that has a process ID.

3.386 System Reboot

An implementation-defined sequence of events that may result in the loss of transitory data; that is, data that is not saved in permanent storage. For example, message queues, shared memory, semaphores, and processes.

3.387 System Trace Event

A trace event that is generated by the implementation, in response either to a system-initiated action or to an application-requested action, except for a call to *posix_trace_event*( ). When supported by the implementation, a system-initiated action generates a process-independent system trace event and an application-requested action generates a process-dependent system trace event. For a system trace event not defined by IEEE Std 1003.1-200x, the associated trace event type identifier is derived from the implementation-defined name for this trace event, and the associated data is of implementation-defined content and length.

3.388 System-Wide

Pertaining to events occurring in all processes existing in an implementation at a given point in time.

3.389 Tab Character (<tab>)

A character that in the output stream indicates that printing or displaying should start at the next horizontal tabulation position on the current line. It is the character designated by `'\t'` in the C language. If the current position is at or past the last defined horizontal tabulation position, the behavior is unspecified. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the tabulation.

3.390 Terminal (or Terminal Device)

A character special file that obeys the specifications of the general terminal interface.

Note: The General Terminal Interface is defined in detail in Chapter 11 (on page 183).

3.391 Text Column

A roughly rectangular block of characters capable of being laid out side-by-side next to other text columns on an output page or terminal screen. The widths of text columns are measured in column positions.

3.392 Text File

A file that contains characters organized into one or more lines. The lines do not contain NUL characters and none can exceed {LINE_MAX} bytes in length, including the <newline>. Although IEEE Std 1003.1-200x does not distinguish between text files and binary files (see the ISO C standard), many utilities only produce predictable or meaningful output when operating on text files. The standard utilities that have such restrictions always specify *text files* in their

STDIN or INPUT FILES sections.

3.393 Thread

A single flow of control within a process. Each thread has its own thread ID, scheduling priority and policy, *errno* value, thread-specific key/value bindings, and the required system resources to support a flow of control. Anything whose address may be determined by a thread, including but not limited to static variables, storage obtained via *malloc*(), directly addressable storage obtained through implementation-defined functions, and automatic variables, are accessible to all threads in the same process.

Note: The *malloc*() function is defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.394 Thread ID

Each thread in a process is uniquely identified during its lifetime by a value of type **pthread_t** called a thread ID.

3.395 Thread List

An ordered set of runnable threads that all have the same ordinal value for their priority.

The ordering of threads on the list is determined by a scheduling policy or policies. The set of thread lists includes all runnable threads in the system.

3.396 Thread-Safe

A function that may be safely invoked concurrently by multiple threads. Each function defined in the System Interfaces volume of IEEE Std 1003.1-200x is thread-safe unless explicitly stated otherwise. Examples are any ''pure'' function, a function which holds a mutex locked while it is accessing static storage, or objects shared among threads.

3.397 Thread-Specific Data Key

A process global handle of type **pthread_key_t** which is used for naming thread-specific data.

Although the same key value may be used by different threads, the values bound to the key by *pthread_setspecific*() and accessed by *pthread_getspecific*() are maintained on a per-thread basis and persist for the life of the calling thread.

Note: The *pthread_getspecific*() and *pthread_setspecific*() functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.398 Tilde

The character `'~'`.

3.399 Timeouts

A method of limiting the length of time an interface will block; see also Section 3.76 (on page 43).

3.400 Timer

A mechanism that can notify a thread when the time as measured by a particular clock has reached or passed a specified value, or when a specified amount of time has passed.

3.401 Timer Overrun

A condition that occurs each time a timer, for which there is already an expiration signal queued to the process, expires.

3.402 Token

In the shell command language, a sequence of characters that the shell considers as a single unit when reading input. A token is either an operator or a word.

Note: The rules for reading input are defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.3, Token Recognition.

3.403 Trace Analyzer Process

A process that extracts trace events from a trace stream to retrieve information about the behavior of an application.

3.404 Trace Controller Process

A process that creates a trace stream for tracing a process.

3.405 Trace Event

A data object that represents an action executed by the system, and that is recorded in a trace stream.

3.406 Trace Event Type

A data object type that defines a class of trace event.

3.407 Trace Event Type Mapping

A one-to-one mapping between trace event types and trace event names.

3.408 Trace Filter

A filter that allows the trace controller process to specify those trace event types that are to be ignored; that is, not generated.

3.409 Trace Generation Version

A data object that is an implementation-defined character string, generated by the trace system and describing the origin and version of the trace system.

3.410 Trace Log

The flushed image of a trace stream, if the trace stream is created with a trace log.

3.411 Trace Point

An action that may cause a trace event to be generated.

3.412 Trace Stream

An opaque object that contains trace events plus internal data needed to interpret those trace events.

3.413 Trace Stream Identifier

A handle to manage tracing operations in a trace stream.

3.414 Trace System

A system that allows both system and user trace events to be generated into a trace stream. These trace events can be retrieved later.

3.415 Traced Process

A process for which at least one trace stream has been created. A traced process is also called a target process.

3.416 Tracing Status of a Trace Stream

A status that describes the state of an active trace stream. The tracing status of a trace stream can be retrieved from the trace stream attributes. An active trace stream can be in one of two states: running or suspended.

3.417 Typed Memory Name Space

A system-wide name space that contains the names of the typed memory objects present in the system. It is configurable for a given implementation.

3.418 Typed Memory Object

A combination of a typed memory pool and a typed memory port. The entire contents of the pool are accessible from the port. The typed memory object is identified through a name that belongs to the typed memory name space.

3.419 Typed Memory Pool

An extent of memory with the same operational characteristics. Typed memory pools may be contained within each other.

3.420 Typed Memory Port

A hardware access path to one or more typed memory pools.

3.421 Unbind

Remove the association between a network address and an endpoint.

3.422 Unit Data

See *Datagram* in Section 3.123 (on page 49).

3.423 Upshifting

The conversion of a lowercase character that has a single-character uppercase representation into this uppercase representation.

3.424 User Database

A system database of implementation-defined format that contains at least the following information for each user ID:

- User name
- Numerical user ID
- Initial numerical group ID
- Initial working directory
- Initial user program

The initial numerical group ID is used by the *newgrp* utility. Any other circumstances under which the initial values are operative are implementation-defined.

If the initial user program field is null, an implementation-defined program is used.

If the initial working directory field is null, the interpretation of that field is implementation-defined.

Note: The *newgrp* utility is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-200x.

3.425 User ID

A non-negative integer that is used to identify a system user. When the identity of a user is associated with a process, a user ID value is referred to as a real user ID, an effective user ID, or a saved set-user-ID.

3.426 User Name

A string that is used to identify a user; see also Section 3.424 (on page 90). To be portable across systems conforming to IEEE Std 1003.1-200x, the value is composed of characters from the portable filename character set. The hyphen should not be used as the first character of a portable user name.

3.427 User Trace Event

A trace event that is generated explicitly by the application as a result of a call to *posix_trace_event*( ).

3.428 Utility

A program, excluding special built-in utilities provided as part of the Shell Command Language, that can be called by name from a shell to perform a specific task, or related set of tasks.

Note: For further information on special built-in utilities, see the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.14, Special Built-In Utilities.

3.429 Variable

In the shell command language, a named parameter.

Note: For further information, see the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.5, Parameters and Variables.

3.430 Vertical-Tab Character (<vertical-tab>)

A character that in the output stream indicates that printing should start at the next vertical tabulation position. It is the character designated by `'\v'` in the C language. If the current position is at or past the last defined vertical tabulation position, the behavior is unspecified. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the tabulation.

3.431 White Space

A sequence of one or more characters that belong to the **space** character class as defined via the *LC_CTYPE* category in the current locale.

In the POSIX locale, white space consists of one or more <blank>s (<space>s and <tab>s), <newline>s, <carriage-return>s, <form-feed>s, and <vertical-tab>s.

3.432 Wide-Character Code (C Language)

An integer value corresponding to a single graphic symbol or control code.

Note: C Language Wide-Character Codes are defined in detail in Section 6.3 (on page 115).

3.433 Wide-Character Input/Output Functions

The functions that perform wide-oriented input from streams or wide-oriented output to streams: *fgetwc*( ), *fputwc*( ), *fputws*( ), *fwprintf*( ), *fwscanf*( ), *getwc*( ), *getwchar*( ), *getws*( ), *putwc*( ), *putwchar*( ), *ungetwc*( ), *vfwprintf*( ), *vwprintf*( ), *wprintf*( ), and *wscanf*( ).

Note: These functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-200x.

3.434 Wide-Character String

A contiguous sequence of wide-character codes terminated by and including the first null wide-character code.

3.435 Word

In the shell command language, a token other than an operator. In some cases a word is also a portion of a word token: in the various forms of parameter expansion, such as ${*name*–*word*}, and variable assignment, such as *name*=*word*, the word is the portion of the token depicted by *word*. The concept of a word is no longer applicable following word expansions—only fields remain.

Note: For further information, see the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.6.2, Parameter Expansion and the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.6, Word Expansions.

3.436 Working Directory (or Current Working Directory)

A directory, associated with a process, that is used in pathname resolution for pathnames that do not begin with a slash.

3.437 Worldwide Portability Interface

Functions for handling characters in a codeset-independent manner.

3.438 Write

To output characters to a file, such as standard output or standard error. Unless otherwise stated, standard output is the default output destination for all uses of the term write; see the distinction between display and write in Section 3.132 (on page 50).

3.439 XSI

The X/Open System Interface is the core application programming interface for C and *sh* programming for systems conforming to the Single UNIX Specification. This is a superset of the mandatory requirements for conformance to IEEE Std 1003.1-200x.

3.440 XSI-Conformant

A system which allows an application to be built using a set of services that are consistent across all systems that conform to IEEE Std 1003.1-200x and that support the XSI extension.

Note: See also Chapter 2 (on page 15).

3.441 Zombie Process

A process that has terminated and that is deleted when its exit status has been reported to another process which is waiting for that process to terminate.

3.442 ±0

The algebraic sign provides additional information about any variable that has the value zero when the representation allows the sign to be determined.

Chapter 4

General Concepts

For the purposes of IEEE Std 1003.1-200x, the general concepts given in Chapter 4 apply.

Note: No shading to denote extensions or options occurs in this chapter. Where the terms and definitions given in this chapter are used elsewhere in text related to extensions and options, they are shaded as appropriate.

4.1 Concurrent Execution

Functions that suspend the execution of the calling thread shall not cause the execution of other threads to be indefinitely suspended.

4.2 Directory Protection

If a directory is writable and the mode bit S_ISVTX is set on the directory, a process may remove or rename files within that directory only if one or more of the following is true:

- The effective user ID of the process is the same as that of the owner ID of the file.
- The effective user ID of the process is the same as that of the owner ID of the directory.
- The process has appropriate privileges.

If the S_ISVTX bit is set on a non-directory file, the behavior is unspecified.

4.3 Extended Security Controls

An implementation may provide implementation-defined extended security controls (see Section 3.159 (on page 54)). These permit an implementation to provide security mechanisms to implement different security policies than those described in IEEE Std 1003.1-200x. These mechanisms shall not alter or override the defined semantics of any of the interfaces in IEEE Std 1003.1-200x.

4.4 File Access Permissions

The standard file access control mechanism uses the file permission bits, as described below.

Implementations may provide *additional* or *alternate* file access control mechanisms, or both. An additional access control mechanism shall only further restrict the access permissions defined by the file permission bits. An alternate file access control mechanism shall:

- Specify file permission bits for the file owner class, file group class, and file other class of that file, corresponding to the access permissions.
- Be enabled only by explicit user action, on a per-file basis by the file owner or a user with the appropriate privilege.
- Be disabled for a file after the file permission bits are changed for that file with *chmod*( ). The disabling of the alternate mechanism need not disable any additional mechanisms supported

by an implementation.

Whenever a process requests file access permission for read, write, or execute/search, if no additional mechanism denies access, access shall be determined as follows:

- If a process has the appropriate privilege:
  - — If read, write, or directory search permission is requested, access shall be granted.
  - — If execute permission is requested, access shall be granted if execute permission is granted to at least one user by the file permission bits or by an alternate access control mechanism; otherwise, access shall be denied.
- Otherwise:
  - — The file permission bits of a file contain read, write, and execute/search permissions for the file owner class, file group class, and file other class.
  - — Access shall be granted if an alternate access control mechanism is not enabled and the requested access permission bit is set for the class (file owner class, file group class, or file other class) to which the process belongs, or if an alternate access control mechanism is enabled and it allows the requested access; otherwise, access shall be denied.

4.5 File Hierarchy

Files in the system are organized in a hierarchical structure in which all of the non-terminal nodes are directories and all of the terminal nodes are any other type of file. Since multiple directory entries may refer to the same file, the hierarchy is properly described as a *directed graph*.

4.6 Filenames

For a filename to be portable across implementations conforming to IEEE Std 1003.1-200x, it shall consist only of the portable filename character set as defined in Section 3.276 (on page 70).

The hyphen character shall not be used as the first character of a portable filename. Uppercase and lowercase letters shall retain their unique identities between conforming implementations. In the case of a portable pathname, the slash character may also be used.

4.7 File Times Update

Each file has three distinct associated time values: *st_atime*, *st_mtime*, and *st_ctime*. The *st_atime* field is associated with the times that the file data is accessed; *st_mtime* is associated with the times that the file data is modified; and *st_ctime* is associated with the times that the file status is changed. These values are returned in the file characteristics structure, as described in **<sys/stat.h>**.

Each function or utility in IEEE Std 1003.1-200x that reads or writes data or changes file status indicates which of the appropriate time-related fields shall be ‘‘marked for update’’. If an implementation of such a function or utility marks for update a time-related field not specified by IEEE Std 1003.1-200x, this shall be documented, except that any changes caused by pathname resolution need not be documented. For the other functions or utilities in IEEE Std 1003.1-200x (those that are not explicitly required to read or write file data or change file status, but that in some implementations happen to do so), the effect is unspecified.

An implementation may update fields that are marked for update immediately, or it may update such fields periodically. At an update point in time, any marked fields shall be set to the current time and the update marks shall be cleared. All fields that are marked for update shall be updated when the file ceases to be open by any process, or when a *stat*( ), *fstat*( ), or *lstat*( ) is performed on the file. Other times at which updates are done are unspecified. Marks for update, and updates themselves, are not done for files on read-only file systems; see Section 3.304 (on page 74).

4.8 Host and Network Byte Orders

When data is transmitted over the network, it is sent as a sequence of octets (8-bit unsigned values). If an entity (such as an address or a port number) can be larger than 8 bits, it needs to be stored in several octets. The convention is that all such values are stored with 8 bits in each octet, and with the first (lowest-addressed) octet holding the most-significant bits. This is called ''network byte order''.

Network byte order may not be convenient for processing actual values. For this, it is more sensible for values to be stored as ordinary integers. This is known as ''host byte order''. In host byte order:

- The most significant bit might not be stored in the first byte in address order.
- Bits might not be allocated to bytes in any obvious order at all.

8-bit values stored in **uint8_t** objects do not require conversion to or from host byte order, as they have the same representation. 16 and 32-bit values can be converted using the *htonl*( ), *htons*( ), *ntohl*( ), and *ntohs*( ) functions. When reading data that is to be converted to host byte order, it should either be received directly into a **uint16_t** or **uint32_t** object or should be copied from an array of bytes using *memcpy*( ) or similar. Passing the data through other types could cause the byte order to be changed. Similar considerations apply when sending data.

4.9 Measurement of Execution Time

The mechanism used to measure execution time shall be implementation-defined. The implementation shall also define to whom the CPU time that is consumed by interrupt handlers and system services on behalf of the operating system will be charged. See Section 3.117 (on page 49).

4.10 Memory Synchronization

Applications shall ensure that access to any memory location by more than one thread of control (threads or processes) is restricted such that no thread of control can read or modify a memory location while another thread of control may be modifying it. Such access is restricted using functions that synchronize thread execution and also synchronize memory with respect to other threads. The following functions synchronize memory with respect to other threads:

fork( )
pthread_barrier_wait( )
pthread_cond_broadcast( )
pthread_cond_signal( )
pthread_cond_timedwait( )
pthread_cond_wait( )
pthread_create( )
pthread_join( )
pthread_mutex_lock( )
pthread_mutex_timedlock( )
pthread_mutex_trylock( )
pthread_mutex_unlock( )
pthread_spin_lock( )
pthread_spin_trylock( )
pthread_spin_unlock( )
pthread_rwlock_rdlock( )
pthread_rwlock_timedrdlock( )
pthread_rwlock_timedwrlock( )
pthread_rwlock_tryrdlock( )
pthread_rwlock_trywrlock( )
pthread_rwlock_unlock( )
pthread_rwlock_wrlock( )
sem_post( )
sem_trywait( )
sem_wait( )
wait( )
waitpid( )

Unless explicitly stated otherwise, if one of the above functions returns an error, it is unspecified whether the invocation causes memory to be synchronized.

Applications may allow more than one thread of control to read a memory location simultaneously.

4.11 Pathname Resolution

Pathname resolution is performed for a process to resolve a pathname to a particular file in a file hierarchy. There may be multiple pathnames that resolve to the same file.

Each filename in the pathname is located in the directory specified by its predecessor (for example, in the pathname fragment **a/b**, file **b** is located in directory **a**). Pathname resolution shall fail if this cannot be accomplished. If the pathname begins with a slash, the predecessor of the first filename in the pathname shall be taken to be the root directory of the process (such pathnames are referred to as *absolute pathnames*). If the pathname does not begin with a slash, the predecessor of the first filename of the pathname shall be taken to be the current working directory of the process (such pathnames are referred to as *relative pathnames*).

The interpretation of a pathname component is dependent on the value of {NAME_MAX} and _POSIX_NO_TRUNC associated with the path prefix of that component. If any pathname component is longer than {NAME_MAX}, the implementation shall consider this an error.

A pathname that contains at least one non-slash character and that ends with one or more trailing slashes shall be resolved as if a single dot character (`'.'`) were appended to the pathname.

If a symbolic link is encountered during pathname resolution, the behavior shall depend on whether the pathname component is at the end of the pathname and on the function being performed. If all of the following are true, then pathname resolution is complete:

1. This is the last pathname component of the pathname.
2. The pathname has no trailing slash.
3. The function is required to act on the symbolic link itself, or certain arguments direct that the function act on the symbolic link itself.

In all other cases, the system shall prefix the remaining pathname, if any, with the contents of the symbolic link. If the combined length exceeds {PATH_MAX}, and the implementation considers this to be an error, *errno* shall be set to [ENAMETOOLONG] and an error indication shall be returned. Otherwise, the resolved pathname shall be the resolution of the pathname just created. If the resulting pathname does not begin with a slash, the predecessor of the first filename of the pathname is taken to be the directory containing the symbolic link.

If the system detects a loop in the pathname resolution process, it shall set *errno* to [ELOOP] and return an error indication. The same may happen if during the resolution process more symbolic links were followed than the implementation allows. This implementation-defined limit shall not be smaller than {SYMLOOP_MAX}.

The special filename dot shall refer to the directory specified by its predecessor. The special filename dot-dot shall refer to the parent directory of its predecessor directory. As a special case, in the root directory, dot-dot may refer to the root directory itself.

A pathname consisting of a single slash shall resolve to the root directory of the process. A null pathname shall not be successfully resolved. A pathname that begins with two successive slashes may be interpreted in an implementation-defined manner, although more than two leading slashes shall be treated as a single slash.

4.12 Process ID Reuse

A process group ID shall not be reused by the system until the process group lifetime ends.

A process ID shall not be reused by the system until the process lifetime ends. In addition, if there exists a process group whose process group ID is equal to that process ID, the process ID shall not be reused by the system until the process group lifetime ends. A process that is not a system process shall not have a process ID of 1.

4.13 Scheduling Policy

A scheduling policy affects process or thread ordering:

- When a process or thread is a running thread and it becomes a blocked thread
- When a process or thread is a running thread and it becomes a preempted thread
- When a process or thread is a blocked thread and it becomes a runnable thread
- When a running thread calls a function that can change the priority or scheduling policy of a process or thread
- In other scheduling policy-defined circumstances

Conforming implementations shall define the manner in which each of the scheduling policies may modify the priorities or otherwise affect the ordering of processes or threads at each of the occurrences listed above. Additionally, conforming implementations shall define in what other circumstances and in what manner each scheduling policy may modify the priorities or affect the ordering of processes or threads.

4.14 Seconds Since the Epoch

A value that approximates the number of seconds that have elapsed since the Epoch. A Coordinated Universal Time name (specified in terms of seconds (*tm_sec*), minutes (*tm_min*), hours (*tm_hour*), days since January 1 of the year (*tm_yday*), and calendar year minus 1900 (*tm_year*)) is related to a time represented as seconds since the Epoch, according to the expression below.

If the year is <1970 or the value is negative, the relationship is undefined. If the year is ≥1970 and the value is non-negative, the value is related to a Coordinated Universal Time name according to the C-language expression, where *tm_sec*, *tm_min*, *tm_hour*, *tm_yday*, and *tm_year* are all integer types:

```
tm_sec + tm_min*60 + tm_hour*3600 + tm_yday*86400 +
    (tm_year-70)*31536000 + ((tm_year-69)/4)*86400 -
    ((tm_year-1)/100)*86400 + ((tm_year+299)/400)*86400
```

The relationship between the actual time of day and the current value for seconds since the Epoch is unspecified.

How any changes to the value of seconds since the Epoch are made to align to a desired relationship with the current actual time are made is implementation-defined. As represented in seconds since the Epoch, each and every day shall be accounted for by exactly 86 400 seconds.

Note: The last three terms of the expression add in a day for each year that follows a leap year starting with the first leap year since the Epoch. The first term adds a day every 4 years starting in 1973, the second subtracts a day back out every 100 years starting in 2001, and the third adds a day back in every 400 years starting in 2001. The divisions in the formula are integer divisions; that is, the remainder is discarded leaving only the integer quotient.

4.15 Semaphore

A minimum synchronization primitive to serve as a basis for more complex synchronization mechanisms to be defined by the application program.

For the semaphores associated with the Semaphores option, a semaphore is represented as a shareable resource that has a non-negative integer value. When the value is zero, there is a (possibly empty) set of threads awaiting the availability of the semaphore.

For the semaphores associated with the X/Open System Interface Extension (XSI), a semaphore is a positive integer (0 through 32767). The *semget*( ) function can be called to create a set or array of semaphores. A semaphore set can contain one or more semaphores up to an implementation-defined value.

Semaphore Lock Operation

An operation that is applied to a semaphore. If, prior to the operation, the value of the semaphore is zero, the semaphore lock operation shall cause the calling thread to be blocked and added to the set of threads awaiting the semaphore; otherwise, the value shall be decremented.

Semaphore Unlock Operation

An operation that is applied to a semaphore. If, prior to the operation, there are any threads in the set of threads awaiting the semaphore, then some thread from that set shall be removed from the set and becomes unblocked; otherwise, the semaphore value shall be incremented.

4.16 Thread-Safety

Refer to the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.9, Threads.

4.17 Tracing

The trace system allows a traced process to have a selection of events created for it. Traces consist of streams of trace event types.

A trace event type is identified on the one hand by a trace event type name, also referenced as a trace event name, and on the other hand by a trace event type identifier. A trace event name is a human-readable string. A trace event type identifier is an opaque identifier used by the trace system. There shall be a one-to-one relationship between trace event type identifiers and trace event names for a given trace stream and also for a given traced process. The trace event type identifier shall be generated automatically from a trace event name by the trace system either when a trace controller process invokes *posix_trace_trid_eventid_open*( ) or when an instrumented application process invokes *posix_trace_eventid_open*( ). Trace event type identifiers are used to filter trace event types, to allow interpretation of user data, and to identify the kind of trace point that generated a trace event.

Each trace event shall be of a particular trace event type, and associated with a trace event type identifier. The execution of a trace point shall generate a trace event if a trace stream has been created and started for the process that executed the trace point and if the corresponding trace event type identifier is not ignored by filtering.

A generated trace event shall be recorded in a trace stream, and optionally also in a trace log if a trace log is associated with the trace stream, except that:

- For a trace stream, if no resources are available for the event, the event is lost.
- For a trace log, if no resources are available for the event, or a flush operation does not succeed, the event is lost.

A trace event recorded in an active trace stream may be retrieved by an application having the appropriate privileges.

A trace event recorded in a trace log may be retrieved by an application having the appropriate privileges after opening the trace log as a pre-recorded trace stream, with the function *posix_trace_open*( ).

When a trace event is reported it is possible to retrieve the following:

- A trace event type identifier
- A timestamp
- The process ID of the traced process, if the trace event is process-dependent
- Any optional trace event data including its length

- If the Threads option is supported, the thread ID, if the trace event is process-dependent
- The program address at which the trace point was invoked

Trace events may be mapped from trace event types to trace event names. One such mapping shall be associated with each trace stream. An active trace stream is associated with a traced process, and also with its children if the Trace Inherit option is supported and also the inheritance policy is set to _POSIX_TRACE_INHERIT. Therefore each traced process has a mapping of the trace event names to trace event type identifiers that have been defined for that process.

Traces can be recorded into either trace streams or trace logs.

The implementation and format of a trace stream are unspecified. A trace stream need not be and generally is not persistent. A trace stream may be either active or pre-recorded:

- An active trace stream is a trace stream that has been created and has not yet been shut down. It can be of one of the two following classes:
  1. An active trace stream without a trace log that was created with the *posix_trace_create*( ) function
  2. If the Trace Log option is supported, an active trace stream with a trace log that was created with the *posix_trace_create_withlog*( ) function
- A pre-recorded trace stream is a trace stream that was opened from a trace log object using the *posix_trace_open*( ) function.

An active trace stream can loop. This behavior means that when the resources allocated by the trace system for the trace stream are exhausted, the trace system reuses the resources associated with the oldest recorded trace events to record new trace events.

If the Trace Log option is supported, an active trace stream with a trace log can be flushed. This operation causes the trace system to write trace events from the trace stream to the associated trace log, following the defined policies or using an explicit function call. After this operation, the trace system may reuse the resources associated with the flushed trace events.

An active trace stream with or without a trace log can be cleared. This operation shall cause all the resources associated with this trace stream to be reinitialized. The trace stream shall behave as if it was returning from its creation, except that the mapping of trace event type identifiers to trace event names shall not be cleared. If a trace log was associated with this trace stream, the trace log shall also be reinitialized.

A trace log shall be recorded when the *posix_trace_shutdown*( ) operation is invoked or during tracing, depending on the tracing strategy which is defined by a log policy. After the trace stream has been shut down, the trace information can be retrieved from the associated trace log using the same interface used to retrieve information from an active trace stream.

For a traced process, if the Trace Inherit option is supported and the trace stream's inheritance attribute is _POSIX_TRACE_INHERIT, the initial targeted traced process shall be traced together with all of its future children. The *posix_pid* member of each trace event in a trace stream shall be the process ID of the traced process.

Each trace point may be an implementation-defined action such as a context switch, or an application-programmed action such as a call to a specific operating system service (for example, *fork*( )) or a call to *posix_trace_event*( ).

Trace points may be filtered. The operation of the filter is to filter out (ignore) selected trace events. By default, no trace events are filtered.

The results of the tracing operations can be analyzed and monitored by a trace controller process or a trace analyzer process.

Only the trace controller process has control of the trace stream it has created. The control of the operation of a trace stream is done using its corresponding trace stream identifier. The trace controller process is able to:

- Initialize the attributes of a trace stream
- Create the trace stream
- Start and stop tracing
- Know the mapping of the traced process
- If the Trace Event Filter option is supported, filter the type of trace events to be recorded
- Shut the trace stream down

A traced process may also be a trace controller process. Only the trace controller process can control its trace stream(s). A trace stream created by a trace controller process shall be shut down if its controller process terminates or executes another file.

A trace controller process may also be a trace analyzer process. Trace analysis can be done concurrently with the traced process or can be done off-line, in the same or in a different platform.

4.18 Treatment of Error Conditions for Mathematical Functions

For all the functions in the **<math.h>** header, an application wishing to check for error situations should set *errno* to 0 and call *feclearexcept*(FE_ALL_EXCEPT) before calling the function. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

The following error conditions are defined for all functions in the **<math.h>** header.

4.18.1 Domain Error

A *domain error* shall occur if an input argument is outside the domain over which the mathematical function is defined. The description of each function lists any required domain errors; an implementation may define additional domain errors, provided that such errors are consistent with the mathematical definition of the function.

On a domain error, the function shall return an implementation-defined value; if the integer expression (math_errhandling & MATH_ERRNO) is non-zero, *errno* shall be set to [EDOM]; if the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, the ‘‘invalid’’ floating-point exception shall be raised.

4.18.2 Pole Error

A *pole error* occurs if the mathematical result of the function is an exact infinity (for example, log(0.0)).

On a pole error, the function shall return the value of the macro HUGE_VAL, HUGE_VALF, or HUGE_VALL according to the return type, with the same sign as the correct value of the function; if the integer expression (math_errhandling & MATH_ERRNO) is non-zero, *errno* shall be set to [ERANGE]; if the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, the ‘‘divide-by-zero’’ floating-point exception shall be raised.

4.18.3 Range Error

A *range error* shall occur if the finite mathematical result of the function cannot be represented in an object of the specified type, due to extreme magnitude.

4.18.3.1 Result Overflows

A floating result overflows if the magnitude of the mathematical result is finite but so large that the mathematical result cannot be represented without extraordinary roundoff error in an object of the specified type. If a floating result overflows and default rounding is in effect, then the function shall return the value of the macro HUGE_VAL, HUGE_VALF, or HUGE_VALL according to the return type, with the same sign as the correct value of the function; if the integer expression (math_errhandling & MATH_ERRNO) is non-zero, *errno* shall be set to [ERANGE]; if the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, the ‘‘overflow’’ floating-point exception shall be raised.

4.18.3.2 Result Underflows

The result underflows if the magnitude of the mathematical result is so small that the mathematical result cannot be represented, without extraordinary roundoff error, in an object of the specified type. If the result underflows, the function shall return an implementation-defined value whose magnitude is no greater than the smallest normalized positive number in the specified type; if the integer expression (math_errhandling & MATH_ERRNO) is non-zero, whether *errno* is set to [ERANGE] is implementation-defined; if the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, whether the ‘‘underflow’’ floating-point exception is raised is implementation-defined.

4.19 Treatment of NaN Arguments for the Mathematical Functions

For functions called with a NaN argument, no errors shall occur and a NaN shall be returned, except where stated otherwise.

If a function with one or more NaN arguments returns a NaN result, the result should be the same as one of the NaN arguments (after possible type conversion), except perhaps for the sign.

On implementations that support the IEC 60559:1989 standard floating point, functions with signaling NaN argument(s) shall be treated as if the function were called with an argument that is a required domain error and shall return a quiet NaN result, except where stated otherwise.

Note: The function might never see the signaling NaN, since it might trigger when the arguments are evaluated during the function call.

On implementations that support the IEC 60559:1989 standard floating point, for those functions that do not have a documented domain error, the following shall apply:

These functions shall fail if:

Domain Error Any argument is a signaling NaN.

Either, the integer expression (math_errhandling & MATH_ERRNO) is non-zero and *errno* shall be set to [EDOM], or the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero and the invalid floating-point exception shall be raised.

4.20 Utility

A utility program shall be either an executable file, such as might be produced by a compiler or linker system from computer source code, or a file of shell source code, directly interpreted by the shell. The program may have been produced by the user, provided by the system implementor, or acquired from an independent distributor.

The system may implement certain utilities as shell functions (see the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.9.5, Function Definition Command) or built-in utilities, but only an application that is aware of the command search order described in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.9.1.1, Command Search and Execution or of performance characteristics can discern differences between the behavior of such a function or built-in utility and that of an executable file.

4.21 Variable Assignment

In the shell command language, a word consisting of the following parts:

```
varname=value
```

When used in a context where assignment is defined to occur and at no other time, the *value* (representing a word or field) shall be assigned as the value of the variable denoted by *varname*.

Note: For further information, see the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.9.1, Simple Commands.

The *varname* and *value* parts shall meet the requirements for a name and a word, respectively, except that they are delimited by the embedded unquoted equals-sign, in addition to other delimiters.

Note: Additional delimiters are described in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.3, Token Recognition.

When a variable assignment is done, the variable shall be created if it did not already exist. If *value* is not specified, the variable shall be given a null value.

Note: An alternative form of variable assignment:

```
symbol=value
```

(where *symbol* is a valid word delimited by an equals-sign, but not a valid name) produces unspecified results. The form *symbol*=*value* is used by the KornShell *name*[*expression*]=*value* syntax.

Chapter 5

File Format Notation

The STDIN, STDOUT, STDERR, INPUT FILES, and OUTPUT FILES sections of the utility descriptions use a syntax to describe the data organization within the files, when that organization is not otherwise obvious. The syntax is similar to that used by the System Interfaces volume of IEEE Std 1003.1-200x *printf*( ) function, as described in this chapter. When used in STDIN or INPUT FILES sections of the utility descriptions, this syntax describes the format that could have been used to write the text to be read, not a format that could be used by the System Interfaces volume of IEEE Std 1003.1-200x *scanf*( ) function to read the input file.

The description of an individual record is as follows:

```
"<format>", [<arg1>, <arg2>,..., <argn>]
```

The *format* is a character string that contains three types of objects defined below:

1. *Characters* that are not *escape sequences* or *conversion specifications*, as described below, shall be copied to the output.
2. *Escape Sequences* represent non-graphic characters.
3. *Conversion Specifications* specify the output format of each argument; (see below).

The following characters have the following special meaning in the format string:

`' '` (An empty character position.) Represents one or more <blank>s.

Δ Represents exactly one <space>.

Table 5-1 lists escape sequences and associated actions on display devices capable of the action.

Table 5-1 Escape Sequences and Associated Actions

Escape Sequence	Represents Character	Terminal Action
`'\\'`	backslash	Print the character `'\'`.
`'\a'`	alert	Attempt to alert the user through audible or visible notification.
`'\b'`	backspace	Move the printing position to one column before the current position, unless the current position is the start of a line.
`'\f'`	form-feed	Move the printing position to the initial printing position of the next logical page.
`'\n'`	newline	Move the printing position to the start of the next line.
`'\r'`	carriage-return	Move the printing position to the start of the current line.
`'\t'`	tab	Move the printing position to the next tab position on the current line. If there are no more tab positions remaining on the line, the behavior is undefined.
`'\v'`	vertical-tab	Move the printing position to the start of the next vertical tab position. If there are no more vertical tab positions left on the page, the behavior is undefined.

Each conversion specification is introduced by the percent-sign character (`'%'`). After the character `'%'`, the following shall appear in sequence:

flags Zero or more *flags*, in any order, that modify the meaning of the conversion specification.

field width An optional string of decimal digits to specify a minimum *field width*. For an output field, if the converted value has fewer bytes than the field width, it shall be padded on the left (or right, if the left-adjustment flag (`'−'`), described below, has been given) to the field width.

precision Gives the minimum number of digits to appear for the `d`, `o`, `i`, `u`, `x`, or `X` conversion specifiers (the field is padded with leading zeros), the number of digits to appear after the radix character for the `e` and `f` conversion specifiers, the maximum number of significant digits for the `g` conversion specifier; or the maximum number of bytes to be written from a string in the `s` conversion specifier. The precision shall take the form of a period (`'.'`) followed by a decimal digit string; a null digit string is treated as zero.

conversion specifier characters
A conversion specifier character (see below) that indicates the type of conversion to be applied.

The *flag* characters and their meanings are:

– The result of the conversion shall be left-justified within the field.

\+ The result of a signed conversion shall always begin with a sign (`'+'` or `'−'`).

<space> If the first character of a signed conversion is not a sign, a <space> shall be prefixed to the result. This means that if the <space> and `'+'` flags both appear, the <space> flag shall be ignored.

The value shall be converted to an alternative form. For `c`, `d`, `i`, `u`, and `s` conversion specifiers, the behavior is undefined. For the `o` conversion specifier, it shall increase the precision to force the first digit of the result to be a zero. For `x` or `X` conversion specifiers, a non-zero result has 0x or 0X prefixed to it, respectively. For

`e`, `E`, `f`, `g`, and `G` conversion specifiers, the result shall always contain a radix character, even if no digits follow the radix character. For `g` and `G` conversion specifiers, trailing zeros shall not be removed from the result as they usually are.

`0` For `d`, `i`, `o`, `u`, `x`, `X`, `e`, `E`, `f`, `g`, and `G` conversion specifiers, leading zeros (following any indication of sign or base) shall be used to pad to the field width; no space padding is performed. If the `'0'` and `'–'` flags both appear, the `'0'` flag shall be ignored. For `d`, `i`, `o`, `u`, `x`, and `X` conversion specifiers, if a precision is specified, the `'0'` flag shall be ignored. For other conversion specifiers, the behavior is undefined.

Each conversion specifier character shall result in fetching zero or more arguments. The results are undefined if there are insufficient arguments for the format. If the format is exhausted while arguments remain, the excess arguments shall be ignored.

The *conversion specifiers* and their meanings are:

`d,i,o,u,x,X` The integer argument shall be written as signed decimal (`d` or `i`), unsigned octal (`o`), unsigned decimal (`u`), or unsigned hexadecimal notation (`x` and `X`). The `d` and `i` specifiers shall convert to signed decimal in the style `"[–]`*dddd*`"`. The `x` conversion specifier shall use the numbers and letters `"0123456789abcdef"` and the `X` conversion specifier shall use the numbers and letters `"0123456789ABCDEF"`. The *precision* component of the argument shall specify the minimum number of digits to appear. If the value being converted can be represented in fewer digits than the specified minimum, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting a zero value with a precision of 0 shall be no characters. If both the field width and precision are omitted, the implementation may precede, follow, or precede and follow numeric arguments of types `d`, `i`, and `u` with <blank>s; arguments of type `o` (octal) may be preceded with leading zeros.

`f` The floating-point number argument shall be written in decimal notation in the style **[–]***ddd.ddd*, where the number of digits after the radix character (shown here as a decimal point) shall be equal to the *precision* specification. The *LC_NUMERIC* locale category shall determine the radix character to use in this format. If the *precision* is omitted from the argument, six digits shall be written after the radix character; if the *precision* is explicitly 0, no radix character shall appear.

`e,E` The floating-point number argument shall be written in the style **[–]***d.ddd*e±*dd* (the symbol `'±'` indicates either a plus or minus sign), where there is one digit before the radix character (shown here as a decimal point) and the number of digits after it is equal to the precision. The *LC_NUMERIC* locale category shall determine the radix character to use in this format. When the precision is missing, six digits shall be written after the radix character; if the precision is 0, no radix character shall appear. The `E` conversion specifier shall produce a number with `E` instead of `e` introducing the exponent. The exponent shall always contain at least two digits. However, if the value to be written requires an exponent greater than two digits, additional exponent digits shall be written as necessary.

`g,G` The floating-point number argument shall be written in style `f` or `e` (or in style `F` or `E` in the case of a `G` conversion specifier), with the precision specifying the number of significant digits. The style used depends on the value converted: style `e` (or `E`) shall be used only if the exponent resulting from the conversion is less than –4 or greater than or equal to the precision. Trailing zeros are removed from the result. A radix character shall appear only if it is followed by a digit.

`c`	The integer argument shall be converted to an **unsigned char** and the resulting byte shall be written.
`s`	The argument shall be taken to be a string and bytes from the string shall be written until the end of the string or the number of bytes indicated by the *precision* specification of the argument is reached. If the precision is omitted from the argument, it shall be taken to be infinite, so all bytes up to the end of the string shall be written.
`%`	Write a `'%'` character; no argument is converted.

In no case does a nonexistent or insufficient *field width* cause truncation of a field; if the result of a conversion is wider than the field width, the field is simply expanded to contain the conversion result. The term *field width* should not be confused with the term *precision* used in the description of `%s`.

Examples

To represent the output of a program that prints a date and time in the form Sunday, July 3, 10:02, where *weekday* and *month* are strings:

```
"%s,Δ%sΔ%d,Δ%d:%.2d\n" <weekday>, <month>, <day>, <hour>, <min>
```

To show `'π'` written to 5 decimal places:

```
"piΔ=Δ%.5f\n",<value of π>
```

To show an input file format consisting of five colon-separated fields:

```
"%s:%s:%s:%s:%s\n", <arg1>, <arg2>, <arg3>, <arg4>, <arg5>
```

Chapter 6

Character Set

6.1 Portable Character Set

Conforming implementations shall support one or more coded character sets. Each supported locale shall include the *portable character set*, which is the set of symbolic names for characters in Table 6-1. This is used to describe characters within the text of IEEE Std 1003.1-200x. The first eight entries in Table 6-1 are defined in the ISO/IEC 6429:1992 standard and the rest of the characters are defined in the ISO/IEC 10646-1:2000 standard.

Table 6-1 Portable Character Set

Symbolic Name	Glyph	UCS	Description
<NUL>		<U0000>	NULL (NUL)
<alert>		<U0007>	BELL (BEL)
<backspace>		<U0008>	BACKSPACE (BS)
<tab>		<U0009>	CHARACTER TABULATION (HT)
<carriage-return>		<U000D>	CARRIAGE RETURN (CR)
<newline>		<U000A>	LINE FEED (LF)
<vertical-tab>		<U000B>	LINE TABULATION (VT)
<form-feed>		<U000C>	FORM FEED (FF)
<space>		<U0020>	SPACE
<exclamation-mark>	!	<U0021>	EXCLAMATION MARK
<quotation-mark>	"	<U0022>	QUOTATION MARK
<number-sign>	#	<U0023>	NUMBER SIGN
<dollar-sign>	$	<U0024>	DOLLAR SIGN
<percent-sign>	%	<U0025>	PERCENT SIGN
<ampersand>	&	<U0026>	AMPERSAND
<apostrophe>	’	<U0027>	APOSTROPHE
<left-parenthesis>	(	<U0028>	LEFT PARENTHESIS
<right-parenthesis>	)	<U0029>	RIGHT PARENTHESIS
<asterisk>	*	<U002A>	ASTERISK
<plus-sign>	+	<U002B>	PLUS SIGN
<comma>	,	<U002C>	COMMA
<hyphen-minus>	–	<U002D>	HYPHEN-MINUS

IEEE Std 1003.1-200x uses character names other than the above, but only in an informative way; for example, in examples to illustrate the use of characters beyond the portable character set with the facilities of IEEE Std 1003.1-200x.

Table 6-1 (on page 111) defines the characters in the portable character set and the corresponding symbolic character names used to identify each character in a character set description file. The table contains more than one symbolic character name for characters whose traditional name differs from the chosen name. Characters defined in Table 6-2 (on page 116) may also be used in character set description files.

IEEE Std 1003.1-200x places only the following requirements on the encoded values of the characters in the portable character set:

- If the encoded values associated with each member of the portable character set are not invariant across all locales supported by the implementation, if an application accesses any pair of locales where the character encodings differ, or accesses data from an application running in a locale which has different encodings from the application's current locale, the results are unspecified.

- The encoded values associated with the digits 0 to 9 shall be such that the value of each character after 0 shall be one greater than the value of the previous character.
- A null character, NUL, which has all bits set to zero, shall be in the set of characters.
- The encoded values associated with the members of the portable character set are each represented in a single byte. Moreover, if the value is stored in an object of C-language type **char**, it is guaranteed to be positive (except the NUL, which is always zero).

Conforming implementations shall support certain character and character set attributes, as defined in Section 7.2 (on page 120).

6.2 Character Encoding

The POSIX locale contains the characters in Table 6-1 (on page 111), which have the properties listed in Section 7.3.1 (on page 122). In other locales, the presence, meaning, and representation of any additional characters is locale-specific.

In locales other than the POSIX locale, a character may have a state-dependent encoding. There are two types of these encodings:

- A single-shift encoding (where each character not in the initial shift state is preceded by a shift code) can be defined if each shift-code and character sequence is considered a multi-byte character. This is done using the concatenated-constant format in a character set description file, as described in Section 6.4 (on page 115). If the implementation supports a character encoding of this type, all of the standard utilities in the Shell and Utilities volume of IEEE Std 1003.1-200x shall support it. Use of a single-shift encoding with any of the functions in the System Interfaces volume of IEEE Std 1003.1-200x that do not specifically mention the effects of state-dependent encoding is implementation-defined.
- A locking-shift encoding (where the state of the character is determined by a shift code that may affect more than the single character following it) cannot be defined with the current character set description file format. Use of a locking-shift encoding with any of the standard utilities in the Shell and Utilities volume of IEEE Std 1003.1-200x or with any of the functions in the System Interfaces volume of IEEE Std 1003.1-200x that do not specifically mention the effects of state-dependent encoding is implementation-defined.

While in the initial shift state, all characters in the portable character set shall retain their usual interpretation and shall not alter the shift state. The interpretation for subsequent bytes in the sequence shall be a function of the current shift state. A byte with all bits zero shall be interpreted as the null character independent of shift state. Thus a byte with all bits zero shall never occur in the second or subsequent bytes of a character.

The maximum allowable number of bytes in a character in the current locale shall be indicated by {MB_CUR_MAX}, defined in the **<stdlib.h>** header and by the **<mb_cur_max>** value in a character set description file; see Section 6.4 (on page 115). The implementation's maximum number of bytes in a character shall be defined by the C-language macro {MB_LEN_MAX}.

6.3 C Language Wide-Character Codes

In the shell, the standard utilities are written so that the encodings of characters are described by the locale's *LC_CTYPE* definition (see Section 7.3.1 (on page 122)) and there is no differentiation between characters consisting of single octets (8-bit bytes) or multiple bytes. However, in the C language, a differentiation is made. To ease the handling of variable length characters, the C language has introduced the concept of wide-character codes.

All wide-character codes in a given process consist of an equal number of bits. This is in contrast to characters, which can consist of a variable number of bytes. The byte or byte sequence that represents a character can also be represented as a wide-character code. Wide-character codes thus provide a uniform size for manipulating text data. A wide-character code having all bits zero is the null wide-character code (see Section 3.246 (on page 66)), and terminates wide-character strings (see Section 3.432 (on page 92)). The wide-character value for each member of the portable character set shall equal its value when used as the lone character in an integer character constant. Wide-character codes for other characters are locale and implementation-defined. State shift bytes shall not have a wide-character code representation.

6.4 Character Set Description File

Implementations shall provide a character set description file for at least one coded character set supported by the implementation. These files are referred to elsewhere in IEEE Std 1003.1-200x as *charmap* files. It is implementation-defined whether or not users or applications can provide additional character set description files.

IEEE Std 1003.1-200x does not require that multiple character sets or codesets be supported. Although multiple charmap files are supported, it is the responsibility of the implementation to provide the file or files; if only one is provided, only that one is accessible using the *localedef* utility's −**f** option.

Each character set description file, except those that use the ISO/IEC 10646-1:2000 standard position values as the encoding values, shall define characteristics for the coded character set and the encoding for the characters specified in Table 6-1 (on page 111), and may define encoding for additional characters supported by the implementation. Other information about the coded character set may also be in the file. Coded character set character values shall be defined using symbolic character names followed by character encoding values.

Each symbolic name specified in Table 6-1 (on page 111) shall be included in the file and shall be mapped to a unique coding value, except as noted below. The glyphs `'{'`, `'}'`, `'_'`, `'-'`, `'/'`, `'\'`, `'.'`, and `'^'` have more than one symbolic name; all symbolic names for each such glyph shall be included, each with identical encoding. If some or all of the control characters identified in Table 6-2 (on page 116) are supported by the implementation, the symbolic names and their corresponding encoding values shall be included in the file. Some of the encodings associated with the symbolic names in Table 6-2 (on page 116) may be the same as characters found in Table 6-1 (on page 111); both names shall be provided for each encoding.

Table 6-2 Control Character Set

<ACK>	<DC2>	<ENQ>	<FS>	<IS4>	<SOH>
<BEL>	<DC3>	<EOT>	<GS>	<LF>	<STX>
<BS>	<DC4>	<ESC>	<HT>	<NAK>	<SUB>
<CAN>	<DEL>	<ETB>	<IS1>	<RS>	<SYN>
<CR>	<DLE>	<ETX>	<IS2>	<SI>	<US>
<DC1>	<EM>	<FF>	<IS3>	<SO>	<VT>

The following declarations can precede the character definitions. Each shall consist of the symbol shown in the following list, starting in column 1, including the surrounding brackets, followed by one or more <blank>s, followed by the value to be assigned to the symbol.

<code_set_name>	The name of the coded character set for which the character set description file is defined. The characters of the name shall be taken from the set of characters with visible glyphs defined in Table 6-1 (on page 111).
<mb_cur_max>	The maximum number of bytes in a multi-byte character. This shall default to 1.
<mb_cur_min>	An unsigned positive integer value that defines the minimum number of bytes in a character for the encoded character set. XSI On XSI-conformant systems, **<mb_cur_min>** shall always be 1.
<escape_char>	The character used to indicate that the characters following shall be interpreted in a special way, as defined later in this section. This shall default to backslash (`'\'`), which is the character used in all the following text and examples, unless otherwise noted.
<comment_char>	The character that, when placed in column 1 of a charmap line, is used to indicate that the line shall be ignored. The default character shall be the number sign (`'#'`).

The character set mapping definitions shall be all the lines immediately following an identifier line containing the string `"CHARMAP"` starting in column 1, and preceding a trailer line containing the string `"END CHARMAP"` starting in column 1. Empty lines and lines containing a **<comment_char>** in the first column shall be ignored. Each non-comment line of the character set mapping definition (that is, between the `"CHARMAP"` and `"END CHARMAP"` lines of the file) shall be in either of two forms:

```
"%s %s %s\n", <symbolic-name>, <encoding>, <comments>
```

or:

```
"%s...%s %s %s\n", <symbolic-name>, <symbolic-name>,
    <encoding>, <comments>
```

In the first format, the line in the character set mapping definition shall define a single symbolic name and a corresponding encoding. A symbolic name is one or more characters from the set shown with visible glyphs in Table 6-1 (on page 111), enclosed between angle brackets. A character following an escape character is interpreted as itself; for example, the sequence `"<\\\>>"` represents the symbolic name `"\>"` enclosed between angle brackets.

In the second format, the line in the character set mapping definition shall define a range of one or more symbolic names. In this form, the symbolic names shall consist of zero or more non-numeric characters from the set shown with visible glyphs in Table 6-1 (on page 111), followed by an integer formed by one or more decimal digits. Both integers shall contain the same number of digits. The characters preceding the integer shall be identical in the two symbolic names, and the integer formed by the digits in the second symbolic name shall be equal to or greater than the integer formed by the digits in the first name. This shall be interpreted as a series of symbolic names formed from the common part and each of the integers between the first and the second integer, inclusive. As an example, <j0101>...<j0104> is interpreted as the symbolic names <j0101>, <j0102>, <j0103>, and <j0104>, in that order.

A character set mapping definition line shall exist for all symbolic names specified in Table 6-1 (on page 111), and shall define the coded character value that corresponds to the character indicated in the table, or the coded character value that corresponds to the control character symbolic name. If the control characters commonly associated with the symbolic names in Table 6-2 (on page 116) are supported by the implementation, the symbolic name and the corresponding encoding value shall be included in the file. Additional unique symbolic names may be included. A coded character value can be represented by more than one symbolic name.

The encoding part is expressed as one (for single-byte character values) or more concatenated decimal, octal, or hexadecimal constants in the following formats:

```
"%cd%u", <escape_char>, <decimal byte value>
"%cx%x", <escape_char>, <hexadecimal byte value>
"%c%o", <escape_char>, <octal byte value>
```

Decimal constants shall be represented by two or three decimal digits, preceded by the escape character and the lowercase letter `'d'`; for example, `"\d05"`, `"\d97"`, or `"\d143"`. Hexadecimal constants shall be represented by two hexadecimal digits, preceded by the escape character and the lowercase letter `'x'`; for example, `"\x05"`, `"\x61"`, or `"\x8f"`. Octal constants shall be represented by two or three octal digits, preceded by the escape character; for example, `"\05"`, `"\141"`, or `"\217"`. In a portable charmap file, each constant represents an 8-bit byte. When constants are concatenated for multi-byte character values, they shall be of the same type, and interpreted in byte order from first to last with the least significant byte of the multi-byte character specified by the last constant. The manner in which these constants are represented in the character stored in the system is implementation-defined. (This notation was chosen for reasons of portability. There is no requirement that the internal representation in the computer memory be in this same order.) Omitting bytes from a multi-byte character definition produces undefined results.

In lines defining ranges of symbolic names, the encoded value shall be the value for the first symbolic name in the range (the symbolic name preceding the ellipsis). Subsequent symbolic names defined by the range shall have encoding values in increasing order. Bytes shall be treated as unsigned octets, and carry shall be propagated between the bytes as necessary to represent the range. For example, the line:

```
<j0101>...<j0104>  \d129\d254
```

is interpreted as:

```
<j0101>            \d129\d254
<j0102>            \d129\d255
<j0103>            \d130\d0
<j0104>            \d130\d1
```

Note that this line is interpreted as the example even on systems with bytes larger than 8 bits.

The comment is optional.

The following declarations can follow the character set mapping definitions (after the `"END CHARMAP"` statement). Each shall consist of the keyword shown in the following list, starting in column 1, followed by the value(s) to be associated to the keyword, as defined below.

WIDTH	An unsigned positive integer value defining the column width (see Section 3.103 (on page 47)) for the printable characters in the coded character set specified in Table 6-1 (on page 111) and Table 6-2 (on page 116). Coded character set character values shall be defined using symbolic character names followed by column width values. Defining a character with more than one **WIDTH** produces undefined results. The **END WIDTH** keyword shall be used to terminate the **WIDTH** definitions. Specifying the width of a non-printable character in a **WIDTH** declaration produces undefined results.
WIDTH_DEFAULT	An unsigned positive integer value defining the default column width for any printable character not listed by one of the **WIDTH** keywords. If no **WIDTH_DEFAULT** keyword is included in the charmap, the default character width shall be 1.

Example

After the `"END CHARMAP"` statement, a syntax for a width definition would be:

```
WIDTH
<A> 1
<B> 1
<C>...<Z> 1
<foo1>...<foon> 2
END WIDTH
```

In this example, the numerical code point values represented by the symbols **<A>** and **<B>** are assigned a width of 1. The code point values **<C>** to **<Z>** inclusive (**<C>**, **<D>**, **<E>**, and so on) are also assigned a width of 1. Using **<A>**...**<Z>** would have required fewer lines, but the alternative was shown to demonstrate flexibility. The keyword **WIDTH_DEFAULT** could have been added as appropriate.

6.4.1 State-Dependent Character Encodings

This section addresses the use of state-dependent character encodings (that is, those in which the encoding of a character is dependent on one or more shift codes that may precede it).

A single-shift encoding (where each character not in the initial shift state is preceded by a shift code) can be defined in the charmap format if each shift-code/character sequence is considered a multi-byte character, defined using the concatenated-constant format described in Section 6.4 (on page 115). If the implementation supports a character encoding of this type, all of the standard utilities shall support it. A locking-shift encoding (where the state of the character is determined by a shift code that may affect more than the single character following it) could be defined with an extension to the charmap format described in Section 6.4 (on page 115). If the implementation supports a character encoding of this type, any of the standard utilities that describe character (*versus* byte) or text-file manipulation shall have the following characteristics:

1. The utility shall process the statefully encoded data as a concatenation of state-independent characters. The presence of redundant locking shifts shall not affect the comparison of two statefully encoded strings.

2. A utility that divides, truncates, or extracts substrings from statefully encoded data shall produce output that contains locking shifts at the beginning or end of the resulting data, if appropriate, to retain correct state information.

Chapter 7

Locale

7.1 General

A *locale* is the definition of the subset of a user's environment that depends on language and cultural conventions. It is made up from one or more categories. Each category is identified by its name and controls specific aspects of the behavior of components of the system. Category names correspond to the following environment variable names:

LC_CTYPE	Character classification and case conversion.
LC_COLLATE	Collation order.
LC_MONETARY	Monetary formatting.
LC_NUMERIC	Numeric, non-monetary formatting.
LC_TIME	Date and time formats.
LC_MESSAGES	Formats of informative and diagnostic messages and interactive responses.

The standard utilities in the Shell and Utilities volume of IEEE Std 1003.1-200x shall base their behavior on the current locale, as defined in the ENVIRONMENT VARIABLES section for each utility. The behavior of some of the C-language functions defined in the System Interfaces volume of IEEE Std 1003.1-200x shall also be modified based on the current locale, as defined by the last call to *setlocale*( ).

Locales other than those supplied by the implementation can be created via the *localedef* utility, provided that the _POSIX2_LOCALEDEF symbol is defined on the system. Even if *localedef* is not provided, all implementations conforming to the System Interfaces volume of IEEE Std 1003.1-200x shall provide one or more locales that behave as described in this chapter. The input to the utility is described in Section 7.3 (on page 120). The value that is used to specify a locale when using environment variables shall be the string specified as the *name* operand to the *localedef* utility when the locale was created. The strings `"C"` and `"POSIX"` are reserved as identifiers for the POSIX locale (see Section 7.2 (on page 120)). When the value of a locale environment variable begins with a slash (`'/'`), it shall be interpreted as the pathname of the locale definition; the type of file (regular, directory, and so on) used to store the locale definition is implementation-defined. If the value does not begin with a slash, the mechanism used to locate the locale is implementation-defined.

If different character sets are used by the locale categories, the results achieved by an application utilizing these categories are undefined. Likewise, if different codesets are used for the data being processed by interfaces whose behavior is dependent on the current locale, or the codeset is different from the codeset assumed when the locale was created, the result is also undefined.

Applications can select the desired locale by invoking the *setlocale*( ) function (or equivalent) with the appropriate value. If the function is invoked with an empty string, such as:

```
setlocale(LC_ALL, "");
```

the value of the corresponding environment variable is used. If the environment variable is unset or is set to the empty string, the implementation shall set the appropriate environment as defined in Chapter 8 (on page 157).

7.2 POSIX Locale

Conforming systems shall provide a *POSIX locale*, also known as the C locale. The behavior of standard utilities and functions in the POSIX locale shall be as if the locale was defined via the *localedef* utility with input data from the POSIX locale tables in Section 7.3.

The tables in Section 7.3 describe the characteristics and behavior of the POSIX locale for data consisting entirely of characters from the portable character set and the control character set. For other characters, the behavior is unspecified. For C-language programs, the POSIX locale shall be the default locale when the *setlocale*( ) function is not called.

The POSIX locale can be specified by assigning to the appropriate environment variables the values `"C"` or `"POSIX"`.

All implementations shall define a locale as the default locale, to be invoked when no environment variables are set, or set to the empty string. This default locale can be the POSIX locale or any other implementation-defined locale. Some implementations may provide facilities for local installation administrators to set the default locale, customizing it for each location. IEEE Std 1003.1-200x does not require such a facility.

7.3 Locale Definition

The capability to specify additional locales to those provided by an implementation is optional, denoted by the _POSIX2_LOCALEDEF symbol. If the option is not supported, only implementation-supplied locales are available. Such locales shall be documented using the format specified in this section.

Locales can be described with the file format presented in this section. The file format is that accepted by the *localedef* utility. For the purposes of this section, the file is referred to as the *locale definition file*, but no locales shall be affected by this file unless it is processed by *localedef* or some similar mechanism. Any requirements in this section imposed upon the utility shall apply to *localedef* or to any other similar utility used to install locale information using the locale definition file format described here.

The locale definition file shall contain one or more locale category source definitions, and shall not contain more than one definition for the same locale category. If the file contains source definitions for more than one category, implementation-defined categories, if present, shall appear after the categories defined by Section 7.1 (on page 119). A category source definition contains either the definition of a category or a **copy** directive. For a description of the **copy** directive, see *localedef*. In the event that some of the information for a locale category, as specified in this volume of IEEE Std 1003.1-200x, is missing from the locale source definition, the behavior of that category, if it is referenced, is unspecified.

A category source definition shall consist of a category header, a category body, and a category trailer. A category header shall consist of the character string naming of the category, beginning with the characters *LC_*. The category trailer shall consist of the string `"END"`, followed by one or more <blank>s and the string used in the corresponding category header.

The category body shall consist of one or more lines of text. Each line shall contain an identifier, optionally followed by one or more operands. Identifiers shall be either keywords, identifying a particular locale element, or collating elements. In addition to the keywords defined in this volume of IEEE Std 1003.1-200x, the source can contain implementation-defined keywords. Each keyword within a locale shall have a unique name (that is, two categories cannot have a commonly-named keyword); no keyword shall start with the characters *LC_*. Identifiers shall be separated from the operands by one or more <blank>s.

Operands shall be characters, collating elements, or strings of characters. Strings shall be enclosed in double-quotes. Literal double-quotes within strings shall be preceded by the <*escape character*>, described below. When a keyword is followed by more than one operand, the operands shall be separated by semicolons; <blank>s shall be allowed both before and after a semicolon.

The first category header in the file can be preceded by a line modifying the comment character. It shall have the following format, starting in column 1:

```
"comment_char %c\n", <comment character>
```

The comment character shall default to the number sign (`'#'`). Blank lines and lines containing the <*comment character*> in the first position shall be ignored.

The first category header in the file can be preceded by a line modifying the escape character to be used in the file. It shall have the following format, starting in column 1:

```
"escape_char %c\n", <escape character>
```

The escape character shall default to backslash, which is the character used in all examples shown in this volume of IEEE Std 1003.1-200x.

A line can be continued by placing an escape character as the last character on the line; this continuation character shall be discarded from the input. Although the implementation need not accept any one portion of a continued line with a length exceeding {LINE_MAX} bytes, it shall place no limits on the accumulated length of the continued line. Comment lines shall not be continued on a subsequent line using an escaped newline character.

Individual characters, characters in strings, and collating elements shall be represented using symbolic names, as defined below. In addition, characters can be represented using the characters themselves or as octal, hexadecimal, or decimal constants. When non-symbolic notation is used, the resultant locale definitions are in many cases not portable between systems. The left angle bracket (`'<'`) is a reserved symbol, denoting the start of a symbolic name; when used to represent itself it shall be preceded by the escape character. The following rules apply to character representation:

1. A character can be represented via a symbolic name, enclosed within angle brackets `'<'` and `'>'`. The symbolic name, including the angle brackets, shall exactly match a symbolic name defined in the charmap file specified via the *localedef* −**f** option, and it shall be replaced by a character value determined from the value associated with the symbolic name in the charmap file. The use of a symbolic name not found in the charmap file shall constitute an error, unless the category is *LC_CTYPE* or *LC_COLLATE*, in which case it shall constitute a warning condition (see *localedef* for a description of actions resulting from errors and warnings). The specification of a symbolic name in a **collating-element** or **collating-symbol** section that duplicates a symbolic name in the charmap file (if present) shall be an error. Use of the escape character or a right angle bracket within a symbolic name is invalid unless the character is preceded by the escape character.

   For example:

   ```
   <c>;<c-cedilla>  "<M><a><y>"
   ```

2. A character in the portable character set can be represented by the character itself, in which case the value of the character is implementation-defined. (Implementations may allow other characters to be represented as themselves, but such locale definitions are not portable.) Within a string, the double-quote character, the escape character, and the right angle bracket character shall be escaped (preceded by the escape character) to be interpreted as the character itself. Outside strings, the characters:

```
, ; < > escape_char
```

shall be escaped to be interpreted as the character itself.

For example:

```
c "May"
```

3. A character can be represented as an octal constant. An octal constant shall be specified as the escape character followed by two or three octal digits. Each constant shall represent a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

   For example:

   ```
   \143;\347;\143\150   "\115\141\171"
   ```

4. A character can be represented as a hexadecimal constant. A hexadecimal constant shall be specified as the escape character followed by an `'x'` followed by two hexadecimal digits. Each constant shall represent a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

   For example:

   ```
   \x63;\xe7;\x63\x68   "\x4d\x61\x79"
   ```

5. A character can be represented as a decimal constant. A decimal constant shall be specified as the escape character followed by a `'d'` followed by two or three decimal digits. Each constant represents a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

   For example:

   ```
   \d99;\d231;\d99\d104  "\d77\d97\d121"
   ```

Implementations may accept single-digit octal, decimal, or hexadecimal constants following the escape character. Only characters existing in the character set for which the locale definition is created shall be specified, whether using symbolic names, the characters themselves, or octal, decimal, or hexadecimal constants. If a charmap file is present, only characters defined in the charmap can be specified using octal, decimal, or hexadecimal constants. Symbolic names not present in the charmap file can be specified and shall be ignored, as specified under item 1 above. |

7.3.1 LC_CTYPE

The *LC_CTYPE* category shall define character classification, case conversion, and other character attributes. In addition, a series of characters can be represented by three adjacent periods representing an ellipsis symbol (`"..."`). The ellipsis specification shall be interpreted as meaning that all values between the values preceding and following it represent valid characters. The ellipsis specification shall be valid only within a single encoded character set; that is, within a group of characters of the same size. An ellipsis shall be interpreted as including in the list all characters with an encoded value higher than the encoded value of the character preceding the ellipsis and lower than the encoded value of the character following the ellipsis.

For example:

```
\x30;...;\x39;
```

includes in the character class all characters with encoded values between the endpoints.

The following keywords shall be recognized. In the descriptions, the term ‘‘automatically included’’ means that it shall not be an error either to include or omit any of the referenced characters; the implementation provides them if missing (even if the entire keyword is missing) and accepts them silently if present. When the implementation automatically includes a missing character, it shall have an encoded value dependent on the charmap file in effect (see the description of the *localedef* **–f** option); otherwise, it shall have a value derived from an implementation-defined character mapping.

The character classes **digit**, **xdigit**, **lower**, **upper**, and **space** have a set of automatically included characters. These only need to be specified if the character values (that is, encoding) differ from the implementation default values. It is not possible to define a locale without these automatically included characters unless some implementation extension is used to prevent their inclusion. Such a definition would not be a proper superset of the C or POSIX locale and thus, it might not be possible for conforming applications to work properly.

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

upper Define characters to be classified as uppercase letters.

In the POSIX locale, the 26 uppercase letters shall be included:

`A B C D E F G H I J K L M N O P Q R S T U V W X Y Z`

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** shall be specified. The uppercase letters <A> to <Z>, as defined in Section 6.4 (on page 115) (the portable character set), are automatically included in this class.

lower Define characters to be classified as lowercase letters.

In the POSIX locale, the 26 lowercase letters shall be included:

`a b c d e f g h i j k l m n o p q r s t u v w x y z`

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** shall be specified. The lowercase letters <a> to <z> of the portable character set are automatically included in this class.

alpha Define characters to be classified as letters.

In the POSIX locale, all characters in the classes **upper** and **lower** shall be included.

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** shall be specified. Characters classified as either **upper** or **lower** are automatically included in this class.

digit Define the characters to be classified as numeric digits.

In the POSIX locale, only:

`0 1 2 3 4 5 6 7 8 9`

shall be included.

In a locale definition file, only the digits <zero>, <one>, <two>, <three>, <four>, <five>, <six>, <seven>, <eight>, and <nine> shall be specified, and in contiguous ascending sequence by numerical value. The digits <zero> to <nine> of the portable character set are automatically included in this class.

alnum Define characters to be classified as letters and numeric digits. Only the characters specified for the **alpha** and **digit** keywords shall be specified. Characters specified for the keywords **alpha** and **digit** are automatically included in this class.

space Define characters to be classified as white-space characters.

In the POSIX locale, at a minimum, the <space>, <form-feed>, <newline>, <carriage-return>, <tab>, and <vertical-tab> shall be included.

In a locale definition file, no character specified for the keywords **upper**, **lower**, **alpha**, **digit**, **graph**, or **xdigit** shall be specified. The <space>, <form-feed>, <newline>, <carriage-return>, <tab>, and <vertical-tab> of the portable character set, and any characters included in the class **blank** are automatically included in this class.

cntrl Define characters to be classified as control characters.

In the POSIX locale, no characters in classes **alpha** or **print** shall be included.

In a locale definition file, no character specified for the keywords **upper**, **lower**, **alpha**, **digit**, **punct**, **graph**, **print**, or **xdigit** shall be specified.

punct Define characters to be classified as punctuation characters.

In the POSIX locale, neither the <space> nor any characters in classes **alpha**, **digit**, or **cntrl** shall be included.

In a locale definition file, no character specified for the keywords **upper**, **lower**, **alpha**, **digit**, **cntrl**, **xdigit**, or as the <space> shall be specified.

graph Define characters to be classified as printable characters, not including the <space>.

In the POSIX locale, all characters in classes **alpha**, **digit**, and **punct** shall be included; no characters in class **cntrl** shall be included.

In a locale definition file, characters specified for the keywords **upper**, **lower**, **alpha**, **digit**, **xdigit**, and **punct** are automatically included in this class. No character specified for the keyword **cntrl** shall be specified.

print Define characters to be classified as printable characters, including the <space>.

In the POSIX locale, all characters in class **graph** shall be included; no characters in class **cntrl** shall be included.

In a locale definition file, characters specified for the keywords **upper**, **lower**, **alpha**, **digit**, **xdigit**, **punct, graph**, and the <space> are automatically included in this class. No character specified for the keyword **cntrl** shall be specified.

xdigit Define the characters to be classified as hexadecimal digits.

In the POSIX locale, only:

```
0 1 2 3 4 5 6 7 8 9 A B C D E F a b c d e f
```

shall be included.

In a locale definition file, only the characters defined for the class **digit** shall be specified, in contiguous ascending sequence by numerical value, followed by one or more sets of six characters representing the hexadecimal digits 10 to 15 inclusive, with each set in ascending order (for example, <A>, <B>, <C>, <D>, <E>, <F>, <a>, <b>, <c>, <d>, <e>, <f>). The digits <zero> to <nine>, the uppercase letters <A> to <F>, and the lowercase letters <a> to <f> of the portable character set are automatically included in this class.

blank Define characters to be classified as <blank>s.

In the POSIX locale, only the <space> and <tab> shall be included.

In a locale definition file, the <space> and <tab> are automatically included in this class. LI **charclass** Define one or more locale-specific character class names as strings separated by semicolons. Each named character class can then be defined subsequently in the *LC_CTYPE* definition. A character class name shall consist of at least one and at most {CHARCLASS_NAME_MAX} bytes of alphanumeric characters from the portable filename character set. The first character of a character class name shall not be a digit. The name shall not match any of the *LC_CTYPE* keywords defined in this volume of IEEE Std 1003.1-200x. Future revisions of IEEE Std 1003.1-200x will not specify any *LC_CTYPE* keywords containing uppercase letters.

charclass-name Define characters to be classified as belonging to the named locale-specific character class. In the POSIX locale, locale-specific named character classes need not exist.

If a class name is defined by a **charclass** keyword, but no characters are subsequently assigned to it, this is not an error; it represents a class without any characters belonging to it.

The *charclass-name* can be used as the *property* argument to the *wctype*() function, in regular expression and shell pattern-matching bracket expressions, and by the *tr* command.

toupper Define the mapping of lowercase letters to uppercase letters.

In the POSIX locale, at a minimum, the 26 lowercase characters:

```
a b c d e f g h i j k l m n o p q r s t u v w x y z
```

shall be mapped to the corresponding 26 uppercase characters:

```
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
```

In a locale definition file, the operand shall consist of character pairs, separated by semicolons. The characters in each character pair shall be separated by a comma and the pair enclosed by parentheses. The first character in each pair is the lowercase letter, the second the corresponding uppercase letter. Only characters specified for the keywords **lower** and **upper** shall be specified. The lowercase letters <a> to <z>, and their corresponding uppercase letters <A> to <Z>, of the portable character set are automatically included in this mapping, but only when the **toupper** keyword is omitted from the locale definition.

tolower Define the mapping of uppercase letters to lowercase letters.

In the POSIX locale, at a minimum, the 26 uppercase characters:

```
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
```

shall be mapped to the corresponding 26 lowercase characters:

`a b c d e f g h i j k l m n o p q r s t u v w x y z`

In a locale definition file, the operand shall consist of character pairs, separated by semicolons. The characters in each character pair shall be separated by a comma and the pair enclosed by parentheses. The first character in each pair is the uppercase letter, the second the corresponding lowercase letter. Only characters specified for the keywords **lower** and **upper** shall be specified. If the **tolower** keyword is omitted from the locale definition, the mapping is the reverse mapping of the one specified for **toupper**.

The following table shows the character class combinations allowed:

Table 7-1 Valid Character Class Combinations

	Can Also Belong To										
In Class	**upper**	**lower**	**alpha**	**digit**	**space**	**cntrl**	**punct**	**graph**	**print**	**xdigit**	**blank**
upper		—	A	x	x	x	x	A	A	—	x
lower	—		A	x	x	x	x	A	A	—	x
alpha	—	—		x	x	x	x	A	A	—	x
digit	x	x	x		x	x	x	A	A	A	x
space	x	x	x	x		—	*	*	*	x	—
cntrl	x	x	x	x	—		x	x	x	x	—
punct	x	x	x	x	—	x		A	A	x	—
graph	—	—	—	—	—	x	—		A	—	—
print	—	—	—	—	—	x	—	—		—	—
xdigit	—	—	—	—	x	x	x	A	A		x
blank	x	x	x	x	A	—	*	*	*	x	

Notes:

1. Explanation of codes:

   A Automatically included; see text.

   — Permitted.

   x Mutually-exclusive.

   * See note 2.

2. The <space>, which is part of the **space** and **blank** classes, cannot belong to **punct** or **graph**, but shall automatically belong to the **print** class. Other **space** or **blank** characters can be classified as any of **punct**, **graph**, or **print**.

7.3.1.1 *LC_CTYPE Category in the POSIX Locale*

The character classifications for the POSIX locale follow; the code listing depicts the *localedef* input, the table represents the same information, sorted by character.

```
LC_CTYPE
# The following is the POSIX locale LC_CTYPE.
# "alpha" is by default "upper" and "lower"
# "alnum" is by definition "alpha" and "digit"
# "print" is by default "alnum", "punct" and the <space>
# "graph" is by default "alnum" and "punct"
#

7.3.2 LC_COLLATE

The *LC_COLLATE* category provides a collation sequence definition for numerous utilities in the Shell and Utilities volume of IEEE Std 1003.1-200x (*sort*, *uniq*, and so on), regular expression matching (see Chapter 9 (on page 165)) and the *strcoll*( ), *strxfrm*( ), *wcscoll*( ), and *wcsxfrm*( ) functions in the System Interfaces volume of IEEE Std 1003.1-200x.

A collation sequence definition shall define the relative order between collating elements (characters and multi-character collating elements) in the locale. This order is expressed in terms of collation values; that is, by assigning each element one or more collation values (also known as collation weights). This does not imply that implementations shall assign such values, but that ordering of strings using the resultant collation definition in the locale behaves as if such assignment is done and used in the collation process. At least the following capabilities are provided:

1. **Multi-character collating elements**. Specification of multi-character collating elements (that is, sequences of two or more characters to be collated as an entity).

2. **User-defined ordering of collating elements**. Each collating element shall be assigned a collation value defining its order in the character (or basic) collation sequence. This ordering is used by regular expressions and pattern matching and, unless collation weights are explicitly specified, also as the collation weight to be used in sorting.

3. **Multiple weights and equivalence classes**. Collating elements can be assigned one or more (up to the limit {COLL_WEIGHTS_MAX}, as defined in **<limits.h>**) collating weights for use in sorting. The first weight is hereafter referred to as the primary weight.

4. **One-to-many mapping**. A single character is mapped into a string of collating elements.

5. **Equivalence class definition**. Two or more collating elements have the same collation value (primary weight).

6. **Ordering by weights**. When two strings are compared to determine their relative order, the two strings are first broken up into a series of collating elements; the elements in each successive pair of elements are then compared according to the relative primary weights for the elements. If equal, and more than one weight has been assigned, then the pairs of collating elements are recompared according to the relative subsequent weights, until either a pair of collating elements compare unequal or the weights are exhausted.

The following keywords shall be recognized in a collation sequence definition. They are described in detail in the following sections.

copy	Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.
collating-element	Define a collating-element symbol representing a multi-character collating element. This keyword is optional.
collating-symbol	Define a collating symbol for use in collation order statements. This keyword is optional.
order_start	Define collation rules. This statement shall be followed by one or more collation order statements, assigning character collation values and collation weights to collating elements.
order_end	Specify the end of the collation-order statements.

7.3.2.1 *The collating-element Keyword*

In addition to the collating elements in the character set, the **collating-element** keyword can be used to define multi-character collating elements. The syntax is as follows:

```
"collating-element %s from \"%s\"\n", <collating-symbol>, <string>
```

The <*collating-symbol*> operand shall be a symbolic name, enclosed between angle brackets (’<’ and ’>’), and shall not duplicate any symbolic name in the current charmap file (if any), or any other symbolic name defined in this collation definition. The string operand is a string of two or more characters that collates as an entity. A <*collating-element*> defined via this keyword is only recognized with the *LC_COLLATE* category.

For example:

```
collating-element <ch> from "<c><h>"
collating-element <e-acute> from "<acute><e>"
collating-element <ll> from "ll"
```

7.3.2.2 *The collating-symbol Keyword*

This keyword shall be used to define symbols for use in collation sequence statements; that is, between the **order_start** and the **order_end** keywords. The syntax is as follows:

```
"collating-symbol %s\n", <collating-symbol>
```

The <*collating-symbol*> shall be a symbolic name, enclosed between angle brackets (`'<'` and `'>'`), and shall not duplicate any symbolic name in the current charmap file (if any), or any other symbolic name defined in this collation definition. A <*collating-symbol*> defined via this keyword is only recognized within the *LC_COLLATE* category.

For example:

```
collating-symbol <UPPER_CASE>
collating-symbol <HIGH>
```

The **collating-symbol** keyword defines a symbolic name that can be associated with a relative position in the character order sequence. While such a symbolic name does not represent any collating element, it can be used as a weight.

7.3.2.3 *The order_start Keyword*

The **order_start** keyword shall precede collation order entries and also define the number of weights for this collation sequence definition and other collation rules. The syntax is as follows:

```
"order_start %s;%s;...;%s\n", <sort-rules>, <sort-rules> ...
```

The operands to the **order_start** keyword are optional. If present, the operands define rules to be applied when strings are compared. The number of operands define how many weights each element is assigned; if no operands are present, one **forward** operand is assumed. If present, the first operand defines rules to be applied when comparing strings using the first (primary) weight; the second when comparing strings using the second weight, and so on. Operands shall be separated by semicolons (`';'`). Each operand shall consist of one or more collation directives, separated by commas (`','`). If the number of operands exceeds the {COLL_WEIGHTS_MAX} limit, the utility shall issue a warning message. The following directives shall be supported:

forward Specifies that comparison operations for the weight level shall proceed from start of string towards the end of string.

backward Specifies that comparison operations for the weight level shall proceed from end of string towards the beginning of string.

position Specifies that comparison operations for the weight level shall consider the relative position of elements in the strings not subject to **IGNORE**. The string containing an element not subject to **IGNORE** after the fewest collating elements subject to **IGNORE** from the start of the compare shall collate first. If both strings contain a character not subject to **IGNORE** in the same relative position, the collating values assigned to the elements shall determine the ordering. In case of equality, subsequent characters not subject to **IGNORE** shall be considered in the same manner.

The directives **forward** and **backward** are mutually-exclusive.

If no operands are specified, a single **forward** operand shall be assumed.

For example:

```
order_start    forward;backward
```

7.3.2.4 Collation Order

The **order_start** keyword shall be followed by collating identifier entries. The syntax for the collating element entries is as follows:

```
"%s %s;%s;...;%s\n", <collating-identifier>, <weight>, <weight>, ...
```

Each *collating-identifier* shall consist of either a character (in any of the forms defined in Section 7.3 (on page 120)), a <*collating-element*>, a <*collating-symbol*>, an ellipsis, or the special symbol **UNDEFINED**. The order in which collating elements are specified determines the character order sequence, such that each collating element shall compare less than the elements following it.

A <*collating-element*> shall be used to specify multi-character collating elements, and indicates that the character sequence specified via the <*collating-element*> is to be collated as a unit and in the relative order specified by its place.

A <*collating-symbol*> can be used to define a position in the relative order for use in weights. No weights shall be specified with a <*collating-symbol*>.

The ellipsis symbol specifies that a sequence of characters shall collate according to their encoded character values. It shall be interpreted as indicating that all characters with a coded character set value higher than the value of the character in the preceding line, and lower than the coded character set value for the character in the following line, in the current coded character set, shall be placed in the character collation order between the previous and the following character in ascending order according to their coded character set values. An initial ellipsis shall be interpreted as if the preceding line specified the NUL character, and a trailing ellipsis as if the following line specified the highest coded character set value in the current coded character set. An ellipsis shall be treated as invalid if the preceding or following lines do not specify characters in the current coded character set. The use of the ellipsis symbol ties the definition to a specific coded character set and may preclude the definition from being portable between implementations.

The symbol **UNDEFINED** shall be interpreted as including all coded character set values not specified explicitly or via the ellipsis symbol. Such characters shall be inserted in the character collation order at the point indicated by the symbol, and in ascending order according to their coded character set values. If no **UNDEFINED** symbol is specified, and the current coded character set contains characters not specified in this section, the utility shall issue a warning message and place such characters at the end of the character collation order.

The optional operands for each collation-element shall be used to define the primary, secondary, or subsequent weights for the collating element. The first operand specifies the relative primary weight, the second the relative secondary weight, and so on. Two or more collation-elements can be assigned the same weight; they belong to the same *equivalence class* if they have the same primary weight. Collation shall behave as if, for each weight level, elements subject to **IGNORE** are removed, unless the **position** collation directive is specified for the corresponding level with the **order_start** keyword. Then each successive pair of elements shall be compared according to the relative weights for the elements. If the two strings compare equal, the process shall be repeated for the next weight level, up to the limit {COLL_WEIGHTS_MAX}.

Weights shall be expressed as characters (in any of the forms specified in Section 7.3 (on page 120)), <*collating-symbol*>s, <*collating-element*>s, an ellipsis, or the special symbol **IGNORE**. A single character, a <*collating-symbol*>, or a <*collating-element*> shall represent the relative position in the character collating sequence of the character or symbol, rather than the character or characters themselves. Thus, rather than assigning absolute values to weights, a particular weight is expressed using the relative order value assigned to a collating element based on its order in the character collation sequence.

One-to-many mapping is indicated by specifying two or more concatenated characters or symbolic names. For example, if the <eszet> is given the string `"<s><s>"` as a weight, comparisons are performed as if all occurrences of the <eszet> are replaced by `"<s><s>"` (assuming that `"<s>"` has the collating weight `"<s>"`). If it is necessary to define <eszet> and `"<s><s>"` as an equivalence class, then a collating element must be defined for the string `"ss"`.

All characters specified via an ellipsis shall by default be assigned unique weights, equal to the relative order of characters. Characters specified via an explicit or implicit **UNDEFINED** special symbol shall by default be assigned the same primary weight (that is, they belong to the same equivalence class). An ellipsis symbol as a weight shall be interpreted to mean that each character in the sequence shall have unique weights, equal to the relative order of their character in the character collation sequence. The use of the ellipsis as a weight shall be treated as an error if the collating element is neither an ellipsis nor the special symbol **UNDEFINED**.

The special keyword **IGNORE** as a weight shall indicate that when strings are compared using the weights at the level where **IGNORE** is specified, the collating element shall be ignored; that is, as if the string did not contain the collating element. In regular expressions and pattern matching, all characters that are subject to **IGNORE** in their primary weight form an equivalence class.

An empty operand shall be interpreted as the collating element itself.

For example, the order statement:

```
<a>     <a>;<a>
```

is equal to:

```
<a>
```

An ellipsis can be used as an operand if the collating element was an ellipsis, and shall be interpreted as the value of each character defined by the ellipsis.

The collation order as defined in this section affects the interpretation of bracket expressions in regular expressions (see Section 9.3.5 (on page 168)).

For example:

```
order_start  forward;backward
UNDEFINED    IGNORE;IGNORE
<LOW>
<space>      <LOW>;<space>
...          <LOW>;...
<a>          <a>;<a>
<a-acute>    <a>;<a-acute>
<a-grave>    <a>;<a-grave>
<A>          <a>;<A>
<A-acute>    <a>;<A-acute>
<A-grave>    <a>;<A-grave>
<ch>         <ch>;<ch>
<Ch>         <ch>;<Ch>
<s>          <s>;<s>
<eszet>      "<s><s>";"<eszet><eszet>"
order_end
```

This example is interpreted as follows:

1. The **UNDEFINED** means that all characters not specified in this definition (explicitly or via the ellipsis) shall be ignored for collation purposes.
2. All characters between <space> and `'a'` shall have the same primary equivalence class and individual secondary weights based on their ordinal encoded values.
3. All characters based on the uppercase or lowercase character `'a'` belong to the same primary equivalence class.
4. The multi-character collating element <ch> is represented by the collating symbol <ch> and belongs to the same primary equivalence class as the multi-character collating element <Ch>.

7.3.2.5 The order_end Keyword

The collating order entries shall be terminated with an **order_end** keyword.

7.3.2.6 LC_COLLATE Category in the POSIX Locale

The collation sequence definition of the POSIX locale follows; the code listing depicts the *localedef* input.

```
LC_COLLATE
# This is the POSIX locale definition for the LC_COLLATE category.
# The order is the same as in the ASCII codeset.

7.3.3 LC_MONETARY

The *LC_MONETARY* category shall define the rules and symbols that are used to format monetary numeric information. This information is available through the *localeconv*( ) function XSI and is used by the *strfmon*( ) function.

XSI Some of the information is also available in an alternative form via the *nl_langinfo*( ) function (see CRNCYSTR in **<langinfo.h>**).

The following items are defined in this category of the locale. The item names are the keywords recognized by the *localedef* utility when defining a locale. They are also similar to the member names of the **lconv** structure defined in **<locale.h>**; see **<locale.h>** for the exact symbols in the header. The *localeconv*( ) function returns {CHAR_MAX} for unspecified integer items and the empty string ("") for unspecified or size zero string items.

In a locale definition file, the operands are strings, formatted as indicated by the grammar in Section 7.4 (on page 149). For some keywords, the strings can contain only integers. Keywords that are not provided, string values set to the empty string (""), or integer keywords set to −1, are used to indicate that the value is not available in the locale. The following keywords shall be recognized:

copy	Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified. **Note:** This is a *localedef* utility keyword, unavailable through *localeconv*( ).
int_curr_symbol	The international currency symbol. The operand shall be a four-character string, with the first three characters containing the alphabetic international currency symbol in accordance with those specified in the ISO 4217:1995 standard. The fourth character shall be the character used to separate the international currency symbol from the monetary quantity.
currency_symbol	The string that shall be used as the local currency symbol.
mon_decimal_point	The operand is a string containing the symbol that shall be used as the decimal delimiter (radix character) in monetary formatted quantities.
mon_thousands_sep	The operand is a string containing the symbol that shall be used as a separator for groups of digits to the left of the decimal delimiter in formatted monetary quantities.
mon_grouping	Define the size of each group of digits in formatted monetary quantities. The operand is a sequence of integers separated by semicolons. Each integer specifies the number of digits in each group, with the initial integer defining the size of the group immediately preceding the decimal delimiter, and the following integers defining the preceding groups. If the last integer is not −1, then the size of the previous group (if any) shall be repeatedly used for the remainder of the digits. If the last integer is −1, then no further grouping shall be performed.
positive_sign	A string that shall be used to indicate a non-negative-valued formatted monetary quantity.
negative_sign	A string that shall be used to indicate a negative-valued formatted monetary quantity.
int_frac_digits	An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity

using **int_curr_symbol**.

frac_digits	An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using **currency_symbol**.
p_cs_precedes	An integer set to 1 if the **currency_symbol** precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.
p_sep_by_space	An integer set to 0 if no space separates the **currency_symbol** from the value for a monetary quantity with a non-negative value, set to 1 if a space separates the symbol from the value, and set to 2 if a space separates the symbol and the sign string, if adjacent.
n_cs_precedes	An integer set to 1 if the **currency_symbol** precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.
n_sep_by_space	An integer set to 0 if no space separates the **currency_symbol** from the value for a monetary quantity with a negative value, set to 1 if a space separates the symbol from the value, and set to 2 if a space separates the symbol and the sign string, if adjacent.
p_sign_posn	An integer set to a value indicating the positioning of the **positive_sign** for a monetary quantity with a non-negative value. The following integer values shall be recognized for **int_n_sign_posn**, **int_p_sign_posn**, **n_sign_posn**, and **p_sign_posn**: 0 Parentheses enclose the quantity and the **currency_symbol**. 1 The sign string precedes the quantity and the **currency_symbol**. 2 The sign string succeeds the quantity and the **currency_symbol**. 3 The sign string precedes the **currency_symbol**. 4 The sign string succeeds the **currency_symbol**.
n_sign_posn	An integer set to a value indicating the positioning of the **negative_sign** for a negative formatted monetary quantity.
int_p_cs_precedes	An integer set to 1 if the **int_curr_symbol** precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.
int_n_cs_precedes	An integer set to 1 if the **int_curr_symbol** precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.
int_p_sep_by_space	An integer to set 0 if no space separates the **int_curr_symbol** from the value for a monetary quantity with a non-negative value, set to 1 if a space separates the symbol from the value, and set to 2 if a space separates the symbol and the sign string, if adjacent.
int_n_sep_by_space	An integer set to 0 if no space separates the **int_curr_symbol** from the value for a monetary quantity with a negative value, set to 1 if a space separates the symbol from the value, and set to 2 if a space separates the symbol and the sign string, if adjacent.

int_p_sign_posn	An integer set to a value indicating the positioning of the **positive_sign** for a positive monetary quantity formatted with the international format.
int_n_sign_posn	An integer set to a value indicating the positioning of the **negative_sign** for a negative monetary quantity formatted with the international format.

7.3.3.1 *LC_MONETARY Category in the POSIX Locale*

The monetary formatting definitions for the POSIX locale follow; the code listing depicting the *localedef* input, the table representing the same information with the addition of *localeconv*( ) XSI and *nl_langinfo*( ) formats. All values are unspecified in the POSIX locale.

```
LC_MONETARY
# This is the POSIX locale definition for
# the LC_MONETARY category.
#
int_curr_symbol     ""
currency_symbol     ""
mon_decimal_point   ""
mon_thousands_sep   ""
mon_grouping        -1
positive_sign       ""
negative_sign       ""
int_frac_digits     -1
frac_digits         -1
p_cs_precedes       -1
p_sep_by_space      -1
n_cs_precedes       -1
n_sep_by_space      -1
p_sign_posn         -1
n_sign_posn         -1
#
END LC_MONETARY
```

Item	langinfo Constant	POSIX Locale Value	localeconv( ) Value	localedef Value
int_curr_symbol	—	N/A	""	""
currency_symbol	CRNCYSTR	N/A	""	""
mon_decimal_point	—	N/A	""	""
mon_thousands_sep	—	N/A	""	""
mon_grouping	—	N/A	""	""
positive_sign	—	N/A	""	""
negative_sign	—	N/A	""	""
int_frac_digits	—	N/A	{CHAR_MAX}	–1
frac_digits	—	N/A	{CHAR_MAX}	–1
p_cs_precedes	CRNCYSTR	N/A	{CHAR_MAX}	–1
p_sep_by_space	—	N/A	{CHAR_MAX}	–1
n_cs_precedes	CRNCYSTR	N/A	{CHAR_MAX}	–1
n_sep_by_space	—	N/A	{CHAR_MAX}	–1
p_sign_posn	—	N/A	{CHAR_MAX}	–1
n_sign_posn	—	N/A	{CHAR_MAX}	–1

XSI In the preceding table, the **langinfo Constant** column represents an XSI-conformant extension. The entry N/A indicates that the value is not available in the POSIX locale.

7.3.4 LC_NUMERIC

The *LC_NUMERIC* category shall define the rules and symbols that are used to format non-monetary numeric information. This information is available through the *localeconv*( ) function. XSI Some of the information is also available in an alternative form via the *nl_langinfo*( ) function.

The following items are defined in this category of the locale. The item names are the keywords recognized by the *localedef* utility when defining a locale. They are also similar to the member names of the **lconv** structure defined in **<locale.h>**; see **<locale.h>** for the exact symbols in the header. The *localeconv*( ) function returns {CHAR_MAX} for unspecified integer items and the empty string ("") for unspecified or size zero string items.

In a locale definition file, the operands are strings, formatted as indicated by the grammar in Section 7.4 (on page 149). For some keywords, the strings can only contain integers. Keywords that are not provided, string values set to the empty string (""), or integer keywords set to −1, shall be used to indicate that the value is not available in the locale. The following keywords shall be recognized:

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified. |

Note: This is a *localedef* utility keyword, unavailable through *localeconv*( ).

decimal_point The operand is a string containing the symbol that shall be used as the decimal delimiter (radix character) in numeric, non-monetary formatted quantities. This keyword cannot be omitted and cannot be set to the empty string. In contexts where standards limit the **decimal_point** to a single byte, the result of specifying a multi-byte operand shall be unspecified.

thousands_sep The operand is a string containing the symbol that shall be used as a separator for groups of digits to the left of the decimal delimiter in numeric, non-monetary formatted monetary quantities. In contexts where standards limit the **thousands_sep** to a single byte, the result of specifying a multi-byte operand shall be unspecified.

grouping Define the size of each group of digits in formatted non-monetary quantities. The operand is a sequence of integers separated by semicolons. Each integer specifies the number of digits in each group, with the initial integer defining the size of the group immediately preceding the decimal delimiter, and the following integers defining the preceding groups. If the last integer is not −1, then the size of the previous group (if any) shall be repeatedly used for the remainder of the digits. If the last integer is −1, then no further grouping shall be performed.

7.3.4.1 LC_NUMERIC Category in the POSIX Locale

The non-monetary numeric formatting definitions for the POSIX locale follow; the code listing depicting the *localedef* input, the table representing the same information with the addition of XSI *localeconv*( ) values, and *nl_langinfo*( ) constants.

```
LC_NUMERIC
# This is the POSIX locale definition for
# the LC_NUMERIC category.
#
decimal_point    "<period>"
thousands_sep    ""
grouping         -1
#
```

```
END LC_NUMERIC
```

Item	langinfo Constant	POSIX Locale Value	localeconv( ) Value	localedef Value
decimal_point	RADIXCHAR	"."	"."	.
thousands_sep	THOUSEP	N/A	""	""
grouping	—	N/A	""	−1

XSI In the preceding table, the **langinfo Constant** column represents an XSI-conforming extension. The entry N/A indicates that the value is not available in the POSIX locale.

7.3.5 LC_TIME

XSI The *LC_TIME* category shall define the interpretation of the conversion specifications supported by the *date* utility and shall affect the behavior of the *strftime*( ), *wcsftime*( ), *strptime*( ), and *nl_langinfo*( ) functions. Since the interfaces for C-language access and locale definition differ significantly, they are described separately.

7.3.5.1 LC_TIME Locale Definition

For locale definition, the following mandatory keywords shall be recognized:

copy	Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.
abday	Define the abbreviated weekday names, corresponding to the `%a` conversion specification (conversion specification in the *strftime*( ), *wcsftime*( ), and *strptime*( ) functions). The operand shall consist of seven semicolon-separated strings, each surrounded by double-quotes. The first string shall be the abbreviated name of the day corresponding to Sunday, the second the abbreviated name of the day corresponding to Monday, and so on.
day	Define the full weekday names, corresponding to the `%A` conversion specification. The operand shall consist of seven semicolon-separated strings, each surrounded by double-quotes. The first string is the full name of the day corresponding to Sunday, the second the full name of the day corresponding to Monday, and so on.
abmon	Define the abbreviated month names, corresponding to the `%b` conversion specification. The operand shall consist of twelve semicolon-separated strings, each surrounded by double-quotes. The first string shall be the abbreviated name of the first month of the year (January), the second the abbreviated name of the second month, and so on.
mon	Define the full month names, corresponding to the `%B` conversion specification. The operand shall consist of twelve semicolon-separated strings, each surrounded by double-quotes. The first string shall be the full name of the first month of the year (January), the second the full name of the second month, and so on.
d_t_fmt	Define the appropriate date and time representation, corresponding to the `%c` conversion specification. The operand shall consist of a string containing any combination of characters and conversion specifications. In addition, the string can contain escape sequences defined in the table in Table 5-1 (on page 108) (`'\\'`, `'\a'`, `'\b'`, `'\f'`, `'\n'`, `'\r'`, `'\t'`, `'\v'`).

d_fmt Define the appropriate date representation, corresponding to the `%x` conversion specification. The operand shall consist of a string containing any combination of characters and conversion specifications. In addition, the string can contain escape sequences defined in the table in Table 5-1 (on page 108).

t_fmt Define the appropriate time representation, corresponding to the `%X` conversion specification. The operand shall consist of a string containing any combination of characters and conversion specifications. In addition, the string can contain escape sequences defined in the table in Table 5-1 (on page 108).

am_pm Define the appropriate representation of the *ante meridiem* and *post meridiem* strings, corresponding to the `%p` conversion specification. The operand shall consist of two strings, separated by a semicolon, each surrounded by double-quotes. The first string shall represent the *ante meridiem* designation, the last string the *post meridiem* designation.

t_fmt_ampm Define the appropriate time representation in the 12-hour clock format with **am_pm**, corresponding to the `%r` conversion specification. The operand shall consist of a string and can contain any combination of characters and conversion specifications. If the string is empty, the 12-hour format is not supported in the locale.

era Define how years are counted and displayed for each era in a locale. The operand shall consist of semicolon-separated strings. Each string shall be an era description segment with the format:

`direction:offset:start_date:end_date:era_name:era_format`

according to the definitions below. There can be as many era description segments as are necessary to describe the different eras.

Note: The start of an era might not be the earliest point in the era—it may be the latest. For example, the Christian era BC starts on the day before January 1, AD 1, and increases with earlier time.

direction Either a `'+'` or a `'−'` character. The `'+'` character shall indicate that years closer to the *start_date* have lower numbers than those closer to the *end_date*. The `'−'` character shall indicate that years closer to the *start_date* have higher numbers than those closer to the *end_date*.

offset The number of the year closest to the *start_date* in the era, corresponding to the `%Ey` conversion specification.

start_date A date in the form *yyyy*/*mm*/*dd*, where *yyyy*, *mm*, and *dd* are the year, month, and day numbers respectively of the start of the era. Years prior to AD 1 shall be represented as negative numbers.

end_date The ending date of the era, in the same format as the *start_date*, or one of the two special values `"−*"` or `"+*"`. The value `"−*"` shall indicate that the ending date is the beginning of time. The value `"+*"` shall indicate that the ending date is the end of time.

era_name A string representing the name of the era, corresponding to the `%EC` conversion specification.

era_format	A string for formatting the year in the era, corresponding to the `%EY` conversion specification.
era_d_fmt	Define the format of the date in alternative era notation, corresponding to the `%Ex` conversion specification.
era_t_fmt	Define the locale's appropriate alternative time format, corresponding to the `%EX` conversion specification.
era_d_t_fmt	Define the locale's appropriate alternative date and time format, corresponding to the `%Ec` conversion specification.
alt_digits	Define alternative symbols for digits, corresponding to the `%O` modified conversion specification. The operand shall consist of semicolon-separated strings, each surrounded by double-quotes. The first string shall be the alternative symbol corresponding with zero, the second string the symbol corresponding with one, and so on. Up to 100 alternative symbol strings can be specified. The `%O` modifier shall indicate that the string corresponding to the value specified via the conversion specification shall be used instead of the value.

7.3.5.2 LC_TIME C-Language Access

XSI This section describes extensions to access information in the *LC_TIME* category using the *nl_langinfo*( ) function. This functionality is dependent on support of the XSI extension (and the rest of this section is not further shaded for this option).

The following constants used to identify items of *langinfo* data can be used as arguments to the *nl_langinfo*( ) function to access information in the *LC_TIME* category. These constants are defined in the **<langinfo.h>** header.

ABDAY_*x*	The abbreviated weekday names (for example Sun), where *x* is a number from 1 to 7.
DAY_*x*	The full weekday names (for example Sunday), where *x* is a number from 1 to 7.
ABMON_*x*	The abbreviated month names (for example Jan), where *x* is a number from 1 to 12.
MON_*x*	The full month names (for example January), where *x* is a number from 1 to 12.
D_T_FMT	The appropriate date and time representation.
D_FMT	The appropriate date representation.
T_FMT	The appropriate time representation.
AM_STR	The appropriate ante-meridiem affix.
PM_STR	The appropriate post-meridiem affix.
T_FMT_AMPM	The appropriate time representation in the 12-hour clock format with AM_STR and PM_STR.
ERA	The era description segments, which describe how years are counted and displayed for each era in a locale. Each era description segment shall have the format:

`direction:offset:start_date:end_date:era_name:era_format`

according to the definitions below. There can be as many era description segments as are necessary to describe the different eras. Era description segments are separated by semicolons.

direction	Either a `'+'` or a `'−'` character. The `'+'` character shall indicate that years closer to the *start_date* have lower numbers than those closer to the *end_date*. The `'−'` character shall indicate that years closer to the *start_date* have higher numbers than those closer to the *end_date*.
offset	The number of the year closest to the *start_date* in the era.
start_date	A date in the form *yyyy*/*mm*/*dd*, where *yyyy*, *mm*, and *dd* are the year, month, and day numbers respectively of the start of the era. Years prior to AD 1 shall be represented as negative numbers.
end_date	The ending date of the era, in the same format as the *start_date*, or one of the two special values `"−*"` or `"+*"`. The value `"−*"` shall indicate that the ending date is the beginning of time. The value `"+*"` shall indicate that the ending date is the end of time.
era_name	The era, corresponding to the `%EC` conversion specification.
era_format	The format of the year in the era, corresponding to the `%EY` conversion specification.

ERA_D_FMT	The era date format.
ERA_T_FMT	The locale's appropriate alternative time format, corresponding to the `%EX` conversion specification.
ERA_D_T_FMT	The locale's appropriate alternative date and time format, corresponding to the `%Ec` conversion specification.
ALT_DIGITS	The alternative symbols for digits, corresponding to the `%O` conversion specification modifier. The value consists of semicolon-separated symbols. The first is the alternative symbol corresponding to zero, the second is the symbol corresponding to one, and so on. Up to 100 alternative symbols may be specified.

7.3.5.3 *LC_TIME Category in the POSIX Locale*

The *LC_TIME* category definition of the POSIX locale follows; the code listing depicts the *localedef* input; the table represents the same information with the addition of *localedef* keywords, conversion specifiers used by the *date* utility and the *strftime*( ), *wcsftime*( ), and *strptime*( ) functions, XSI and *nl_langinfo*( ) constants.

```
LC_TIME
# This is the POSIX locale definition for
# the LC_TIME category.
#
# Abbreviated weekday names (%a)
abday      "<S><u><n>";"<M><o><n>";"<T><u><e>";"<W><e><d>";\
           "<T><h><u>";"<F><r><i>";"<S><a><t>"
#
# Full weekday names (%A)
```

```
day        "<S><u><n><d><a><y>";"<M><o><n><d><a><y>";\
           "<T><u><e><s><d><a><y>";"<W><e><d><n><e><s><d><a><y>";\
           "<T><h><u><r><s><d><a><y>";"<F><r><i><d><a><y>";\
           "<S><a><t><u><r><d><a><y>"
#
# Abbreviated month names (%b)
abmon      "<J><a><n>";"<F><e><b>";"<M><a><r>";\
           "<A><p><r>";"<M><a><y>";"<J><u><n>";\
           "<J><u><l>";"<A><u><g>";"<S><e><p>";\

XSI In the preceding table, the **langinfo Constant** column represents an XSI-conformant extension.

The entry ''N/A'' indicates the value is not available in the POSIX locale.

7.3.6 LC_MESSAGES

The *LC_MESSAGES* category shall define the format and values used by various utilities for affirmative and negative responses. XSI This information is available through the *nl_langinfo*( ) function.

XSI The message catalog used by the standard utilities and selected by the *catopen*( ) function shall be determined by the setting of *NLSPATH*; see Chapter 8 (on page 157). The *LC_MESSAGES* category can be specified as part of an *NLSPATH* substitution field.

The following keywords shall be recognized as part of the locale definition file.

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified. |

Note: This is a *localedef* keyword, unavailable through *nl_langinfo*( ).

yesexpr The operand consists of an extended regular expression (see Section 9.4 (on page 171)) that describes the acceptable affirmative response to a question expecting an affirmative or negative response.

noexpr The operand consists of an extended regular expression that describes the acceptable negative response to a question expecting an affirmative or negative response.

7.3.6.1 *LC_MESSAGES Category for the POSIX Locale*

The format and values for affirmative and negative responses of the POSIX locale follow; the code listing depicting the *localedef* input, the table representing the same information XSI with the addition of *nl_langinfo*( ) constants.

```
LC_MESSAGES
# This is the POSIX locale definition for
# the LC_MESSAGES category.
#
yesexpr "<circumflex><left-square-bracket><y><Y><right-square-bracket>"
#
noexpr  "<circumflex><left-square-bracket><n><N><right-square-bracket>"
#
END LC_MESSAGES
```

localedef Keyword	langinfo Constant	POSIX Locale Value
yesexpr	YESEXPR	`"^[yY]"`
noexpr	NOEXPR	`"^[nN]"`

XSI In the preceding table, the **langinfo Constant** column represents an XSI-conformant extension.

7.4 Locale Definition Grammar

The grammar and lexical conventions in this section shall together describe the syntax for the locale definition source. The general conventions for this style of grammar are described in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 1.10, Grammar Conventions. The grammar shall take precedence over the text in this chapter.

7.4.1 Locale Lexical Conventions

The lexical conventions for the locale definition grammar are described in this section.

The following tokens shall be processed (in addition to those string constants shown in the grammar):

LOC_NAME	A string of characters representing the name of a locale.
CHAR	Any single character.
NUMBER	A decimal number, represented by one or more decimal digits.
COLLSYMBOL	A symbolic name, enclosed between angle brackets. The string cannot duplicate any charmap symbol defined in the current charmap (if any), or a **COLLELEMENT** symbol.
COLLELEMENT	A symbolic name, enclosed between angle brackets, which cannot duplicate either any charmap symbol or a **COLLSYMBOL** symbol.
CHARCLASS	A string of alphanumeric characters from the portable character set, the first of which is not a digit, consisting of at least one and at most {CHARCLASS_NAME_MAX} bytes, and optionally surrounded by double-quotes.
CHARSYMBOL	A symbolic name, enclosed between angle brackets, from the current charmap (if any).
OCTAL_CHAR	One or more octal representations of the encoding of each byte in a single character. The octal representation consists of an escape character (normally a backslash) followed by two or more octal digits.
HEX_CHAR	One or more hexadecimal representations of the encoding of each byte in a single character. The hexadecimal representation consists of an escape character followed by the constant *x* and two or more hexadecimal digits.
DECIMAL_CHAR	One or more decimal representations of the encoding of each byte in a single character. The decimal representation consists of an escape character followed by a character `'d'` and two or more decimal digits.
ELLIPSIS	The string `"..."`.
EXTENDED_REG_EXP	An extended regular expression as defined in the grammar in Section 9.5 (on page 175).
EOL	The line termination character newline.

7.4.2 Locale Grammar

This section presents the grammar for the locale definition.

```
%token              LOC_NAME

                            | 'era_d_t_fmt' | 'alt_digits'
                            ;

        time_list           : time_list ';' time_string
                            | time_string
                            ;

        time_string         : '"' char_list '"'
                            ;

        time_tlr            : 'END' 'LC_TIME' EOL
                            ;
```

Chapter 8

Environment Variables

8.1 Environment Variable Definition

Environment variables defined in this chapter affect the operation of multiple utilities, functions, and applications. There are other environment variables that are of interest only to specific utilities. Environment variables that apply to a single utility only are defined as part of the utility description. See the ENVIRONMENT VARIABLES section of the utility descriptions in the Shell and Utilities volume of IEEE Std 1003.1-200x for information on environment variable usage.

The value of an environment variable is a string of characters. For a C-language program, an array of strings called the environment shall be made available when a process begins. The array is pointed to by the external variable *environ*, which is defined as:

```
extern char **environ;
```

These strings have the form *name*=*value*; *name*s shall not contain the character `'='`. For values to be portable across systems conforming to IEEE Std 1003.1-200x, the value shall be composed of characters from the portable character set (except NUL and as indicated below). There is no meaning associated with the order of strings in the environment. If more than one string in a process' environment has the same *name*, the consequences are undefined.

Environment variable names used by the utilities in the Shell and Utilities volume of IEEE Std 1003.1-200x consist solely of uppercase letters, digits, and the `'_'` (underscore) from the characters defined in Table 6-1 (on page 111) and do not begin with a digit. Other characters may be permitted by an implementation; applications shall tolerate the presence of such names. Uppercase and lowercase letters shall retain their unique identities and shall not be folded together. The name space of environment variable names containing lowercase letters is reserved for applications. Applications can define any environment variables with names from this name space without modifying the behavior of the standard utilities.

Note: Other applications may have difficulty dealing with environment variable names that start with a digit. For this reason, use of such names is not recommended anywhere.

The *values* that the environment variables may be assigned are not restricted except that they are considered to end with a null byte and the total space used to store the environment and the arguments to the process is limited to {ARG_MAX} bytes.

Other *name*=*value* pairs may be placed in the environment by, for example, calling any of the XSI *setenv*( ), *unsetenv*( ), or *putenv*( ) functions, manipulating the *environ* variable, or by using *envp* arguments when creating a process; see *exec* in the System Interfaces volume of IEEE Std 1003.1-200x.

It is unwise to conflict with certain variables that are frequently exported by widely used command interpreters and applications:

If the variables in the following two sections are present in the environment during the execution of an application or utility, they shall be given the meaning described below. Some are placed into the environment by the implementation at the time the user logs in; all can be added or changed by the user or any ancestor of the current process. The implementation adds or changes environment variables named in IEEE Std 1003.1-200x only as specified in IEEE Std 1003.1-200x. If they are defined in the application's environment, the utilities in the Shell and Utilities volume of IEEE Std 1003.1-200x and the functions in the System Interfaces volume of IEEE Std 1003.1-200x assume they have the specified meaning. Conforming applications shall not set these environment variables to have meanings other than as described. See *getenv*( ) and the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.12, Shell Execution Environment for methods of accessing these variables.

8.2 Internationalization Variables

This section describes environment variables that are relevant to the operation of internationalized interfaces described in IEEE Std 1003.1-200x.

Users may use the following environment variables to announce specific localization requirements to applications. Applications can retrieve this information using the *setlocale*( ) function to initialize the correct behavior of the internationalized interfaces. The descriptions of the internationalization environment variables describe the resulting behavior only when the application locale is initialized in this way. The use of the internationalization variables by utilities described in the Shell and Utilities volume of IEEE Std 1003.1-200x are described in the ENVIRONMENT VARIABLES section for those utilities in addition to the global effects described in this section.

LANG This variable shall determine the locale category for native language, local customs, and coded character set in the absence of the *LC_ALL* and other *LC_** (*LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*) environment variables. This can be used by applications to determine the language to use for error messages and instructions, collating sequences, date formats, and so on.

LC_ALL	This variable shall determine the values for all locale categories. The value of the *LC_ALL* environment variable has precedence over any of the other environment variables starting with *LC_*(*LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*) and the *LANG* environment variable.
LC_COLLATE	This variable shall determine the locale category for character collation. It determines collation information for regular expressions and sorting, including equivalence classes and multi-character collating elements, in various utilities and the *strcoll*( ) and *strxfrm*( ) functions. Additional semantics of this variable, if any, are implementation-defined.
LC_CTYPE	This variable shall determine the locale category for character handling functions, such as *tolower*( ), *toupper*( ), and *isalpha*( ). This environment variable determines the interpretation of sequences of bytes of text data as characters (for example, single as opposed to multi-byte characters), the classification of characters (for example, alpha, digit, graph), and the behavior of character classes. Additional semantics of this variable, if any, are implementation-defined.
LC_MESSAGES	This variable shall determine the locale category for processing affirmative and negative responses and the language and cultural conventions in which messages should be written. It also affects the behavior of the *catopen*( ) function in determining the message catalog. Additional semantics of this variable, if any, are implementation-defined. The language and cultural conventions of diagnostic and informative messages whose format is unspecified by IEEE Std 1003.1-200x should be affected by the setting of *LC_MESSAGES*.
LC_MONETARY	This variable shall determine the locale category for monetary-related numeric formatting information. Additional semantics of this variable, if any, are implementation-defined.
LC_NUMERIC	This variable shall determine the locale category for numeric formatting (for example, thousands separator and radix character) information in various utilities as well as the formatted I/O operations in *printf*( ) and *scanf*( ) and the string conversion functions in *strtod*( ). Additional semantics of this variable, if any, are implementation-defined.
LC_TIME	This variable shall determine the locale category for date and time formatting information. It affects the behavior of the time functions in *strftime*( ). Additional semantics of this variable, if any, are implementation-defined.
NLSPATH	This variable shall contain a sequence of templates that the *catopen*( ) function uses when attempting to locate message catalogs. Each template consists of an optional prefix, one or more conversion specifications, a filename, and an optional suffix.

For example:

```
NLSPATH="/system/nlslib/%N.cat"
```

defines that *catopen*( ) should look for all message catalogs in the directory **/system/nlslib**, where the catalog name should be constructed from the *name* parameter passed to *catopen*( ) (%N), with the suffix **.cat**.

Conversion specifications consist of a ′%′ symbol, followed by a single-letter keyword. The following keywords are currently defined:

`%N`	The value of the *name* parameter passed to *catopen*( ).
`%L`	The value of the *LC_MESSAGES* category.
`%l`	The *language* element from the *LC_MESSAGES* category.
`%t`	The *territory* element from the *LC_MESSAGES* category.
`%c`	The *codeset* element from the *LC_MESSAGES* category.
`%%`	A single `'%'` character.

An empty string is substituted if the specified value is not currently defined. The separators underscore (`'_'`) and period (`'.'`) are not included in the `%t` and `%c` conversion specifications.

Templates defined in *NLSPATH* are separated by colons (`':'`). A leading or two adjacent colons `"::"` is equivalent to specifying `%N`. For example:

```
NLSPATH=":%N.cat:/nlslib/%L/%N.cat"
```

indicates to *catopen*( ) that it should look for the requested message catalog in *name*, *name*.**cat**, and **/nlslib/***category*/*name*.**cat**, where *category* is the value of the *LC_MESSAGES* category of the current locale.

Users should not set the *NLSPATH* variable unless they have a specific reason to override the default system path. Setting *NLSPATH* to override the default system path produces undefined results in the standard utilities and in applications with appropriate privileges.

The environment variables *LANG*, *LC_ALL*, *LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*, and *NLSPATH* provide for the support of internationalized applications. The standard utilities shall make use of these environment variables as described in this section and the individual ENVIRONMENT VARIABLES sections for the utilities. If these variables specify locale categories that are not based upon the same underlying codeset, the results are unspecified.

The values of locale categories shall be determined by a precedence order; the first condition met below determines the value:

1. If the *LC_ALL* environment variable is defined and is not null, the value of *LC_ALL* shall be used.
2. If the *LC_** environment variable (*LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*) is defined and is not null, the value of the environment variable shall be used to initialize the category that corresponds to the environment variable.
3. If the *LANG* environment variable is defined and is not null, the value of the *LANG* environment variable shall be used.
4. If the *LANG* environment variable is not set or is set to the empty string, the implementation-defined default locale shall be used.

If the locale value is `"C"` or `"POSIX"`, the POSIX locale shall be used and the standard utilities behave in accordance with the rules in Section 7.2 (on page 120) for the associated category.

If the locale value begins with a slash, it shall be interpreted as the pathname of a file that was created in the output format used by the *localedef* utility; see OUTPUT FILES under *localedef*. Referencing such a pathname shall result in that locale being used for the indicated category.

XSI If the locale value has the form:

```
language[_territory][.codeset]
```

it refers to an implementation-provided locale, where settings of language, territory, and codeset are implementation-defined.

LC_COLLATE, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, and *LC_TIME* are defined to accept an additional field *@modifier*, which allows the user to select a specific instance of localization data within a single category (for example, for selecting the dictionary as opposed to the character ordering of data). The syntax for these environment variables is thus defined as:

```
[language[_territory][.codeset][@modifier]]
```

For example, if a user wanted to interact with the system in French, but required to sort German text files, *LANG* and *LC_COLLATE* could be defined as:

```
LANG=Fr_FR
LC_COLLATE=De_DE
```

This could be extended to select dictionary collation (say) by use of the *@modifier* field; for example:

```
LC_COLLATE=De_DE@dict
```

An implementation may support other formats.

If the locale value is not recognized by the implementation, the behavior is unspecified.

At runtime, these values are bound to a program's locale by calling the *setlocale*( ) function.

Additional criteria for determining a valid locale name are implementation-defined.

8.3 Other Environment Variables

COLUMNS	This variable shall represent a decimal integer >0 used to indicate the user's preferred width in column positions for the terminal screen or window; see Section 3.103 (on page 47). If this variable is unset or null, the implementation determines the number of columns, appropriate for the terminal or window, in an unspecified manner. When *COLUMNS* is set, any terminal-width information implied by *TERM* is overridden. Users and conforming applications should not set *COLUMNS* unless they wish to override the system selection and produce output unrelated to the terminal characteristics. Users should not need to set this variable in the environment unless there is a specific reason to override the implementation's default behavior, such as to display data in an area arbitrarily smaller than the terminal or window.
XSI *DATEMSK*	Indicates the pathname of the template file used by *getdate*( ).
HOME	The system shall initialize this variable at the time of login to be a pathname of the user's home directory. See **<pwd.h>**.
LINES	This variable shall represent a decimal integer >0 used to indicate the user's preferred number of lines on a page or the vertical screen or window size in lines. A line in this case is a vertical measure large enough to hold the tallest character in the character set being displayed. If this variable is unset or null, the implementation determines the number of lines, appropriate for the

		terminal or window (size, terminal baud rate, and so on), in an unspecified manner. When *LINES* is set, any terminal-height information implied by *TERM* is overridden. Users and conforming applications should not set *LINES* unless they wish to override the system selection and produce output unrelated to the terminal characteristics. Users should not need to set this variable in the environment unless there is a specific reason to override the implementation's default behavior, such as to display data in an area arbitrarily smaller than the terminal or window.
	LOGNAME	The system shall initialize this variable at the time of login to be the user's login name. See **<pwd.h>**. For a value of *LOGNAME* to be portable across implementations of IEEE Std 1003.1-200x, the value should be composed of characters from the portable filename character set.
XSI	*MSGVERB*	Describes which message components shall be used in writing messages by *fmtmsg*( ).
	PATH	This variable shall represent the sequence of path prefixes that certain functions and utilities apply in searching for an executable file known only by a filename. The prefixes shall be separated by a colon (`':'`). When a non-zero-length prefix is applied to this filename, a slash shall be inserted between the prefix and the filename. A zero-length prefix is a legacy feature that indicates the current working directory. It appears as two adjacent colons (`"::"`), as an initial colon preceding the rest of the list, or as a trailing colon following the rest of the list. A strictly conforming application shall use an actual pathname (such as **.**) to represent the current working directory in *PATH*. The list shall be searched from beginning to end, applying the filename to each prefix, until an executable file with the specified name and appropriate execution permissions is found. If the pathname being sought contains a slash, the search through the path prefixes shall not be performed. If the pathname begins with a slash, the specified path is resolved (see Section 4.11 (on page 98)). If *PATH* is unset or is set to null, the path search is implementation-defined.
	PWD	This variable shall represent an absolute pathname of the current working directory. It shall not contain any filename components of dot or dot-dot. The value is set by the *cd* utility.
	SHELL	This variable shall represent a pathname of the user's preferred command language interpreter. If this interpreter does not conform to the Shell Command Language in the Shell and Utilities volume of IEEE Std 1003.1-200x, Chapter 2, Shell Command Language, utilities may behave differently from those described in IEEE Std 1003.1-200x.
	TMPDIR	This variable shall represent a pathname of a directory made available for programs that need a place to create temporary files.
	TERM	This variable shall represent the terminal type for which output is to be prepared. This information is used by utilities and application programs wishing to exploit special capabilities specific to a terminal. The format and allowable values of this environment variable are unspecified.
	TZ	This variable shall represent timezone information. The contents of the environment variable named *TZ* shall be used by the *ctime*( ), *localtime*( ), *strftime*( ), and *mktime*( ) functions, and by various utilities, to override the default timezone. The value of *TZ* has one of the two forms (spaces inserted

for clarity):

`:characters`

or:

`std offset dst offset, rule`

If *TZ* is of the first format (that is, if the first character is a colon), the characters following the colon are handled in an implementation-defined manner.

The expanded format (for all *TZ*s whose value does not have a colon as the first character) is as follows:

`stdoffset[dst[offset][,start[/time],end[/time]]]`

Where:

std and *dst* Indicate no less than three, nor more than {TZNAME_MAX}, bytes that are the designation for the standard (*std*) or the alternative (*dst*—such as Daylight Savings Time) timezone. Only *std* is required; if *dst* is missing, then the alternative time does not apply in this locale.

Each of these fields may occur in either of two formats quoted or unquoted:

- In the quoted form, the first character shall be the less-than (`'<'`) character and the last character shall be the greater-than (`'>'`) character. All characters between these quoting characters shall be alphanumeric characters in the current locale, the plus-sign (`'+'`) character, or the minus-sign (`'−'`) character. The *std* and *dst* fields in this case shall not include the quoting characters. |
- In the unquoted form, all characters in these fields shall be alphabetic characters in the current locale.

The interpretation of these fields is unspecified if either field is less than three bytes (except for the case when *dst* is missing), more than {TZNAME_MAX} bytes, or if they contain characters other than those specified.

offset Indicates the value added to the local time to arrive at Coordinated Universal Time. The *offset* has the form:

`hh[:mm[:ss]]`

The minutes (*mm*) and seconds (*ss*) are optional. The hour (*hh*) shall be required and may be a single digit. The *offset* following *std* shall be required. If no *offset* follows *dst*, the alternative time is assumed to be one hour ahead of standard time. One or more digits may be used; the value is always interpreted as a decimal number. The hour shall be between zero and 24, and the minutes (and seconds)—if present—between zero and 59. The result of using values outside of this range is unspecified. If preceded by a `'−'`, the timezone shall be east of the Prime Meridian; otherwise, it shall be west (which may be indicated by an optional preceding `'+'`).

rule	Indicates when to change to and back from the alternative time. The *rule* has the form:

```
date[/time],date[/time]
```

where the first *date* describes when the change from standard to alternative time occurs and the second *date* describes when the change back happens. Each *time* field describes when, in current local time, the change to the other time is made.

The format of *date* is one of the following:

J*n*	The Julian day *n* ($1 \leq n \leq 365$). Leap days shall not be counted. That is, in all years—including leap years—February 28 is day 59 and March 1 is day 60. It is impossible to refer explicitly to the occasional February 29.
n	The zero-based Julian day ($0 \leq n \leq 365$). Leap days shall be counted, and it is possible to refer to February 29.
M*m.n.d*	The *d*'th day ($0 \leq d \leq 6$) of week *n* of month *m* of the year ($1 \leq n \leq 5$, $1 \leq m \leq 12$, where week 5 means "the last *d* day in month *m*" which may occur in either the fourth or the fifth week). Week 1 is the first week in which the *d*'th day occurs. Day zero is Sunday.

The *time* has the same format as *offset* except that no leading sign (`'−'` or `'+'`) is allowed. The default, if *time* is not given, shall be 02:00:00.

Chapter 9

Regular Expressions

Regular Expressions (REs) provide a mechanism to select specific strings from a set of character strings.

Regular expressions are a context-independent syntax that can represent a wide variety of character sets and character set orderings, where these character sets are interpreted according to the current locale. While many regular expressions can be interpreted differently depending on the current locale, many features, such as character class expressions, provide for contextual invariance across locales.

The Basic Regular Expression (BRE) notation and construction rules in Section 9.3 (on page 167) shall apply to most utilities supporting regular expressions. Some utilities, instead, support the Extended Regular Expressions (ERE) described in Section 9.4 (on page 171); any exceptions for both cases are noted in the descriptions of the specific utilities using regular expressions. Both BREs and EREs are supported by the Regular Expression Matching interface in the System Interfaces volume of IEEE Std 1003.1-200x under *regcomp*( ), *regexec*( ), and related functions.

9.1 Regular Expression Definitions

For the purposes of this section, the following definitions shall apply:

entire regular expression
The concatenated set of one or more BREs or EREs that make up the pattern specified for string selection.

matched
A sequence of zero or more characters shall be said to be matched by a BRE or ERE when the characters in the sequence correspond to a sequence of characters defined by the pattern.

Matching shall be based on the bit pattern used for encoding the character, not on the graphic representation of the character. This means that if a character set contains two or more encodings for a graphic symbol, or if the strings searched contain text encoded in more than one codeset, no attempt is made to search for any other representation of the encoded symbol. If that is required, the user can specify equivalence classes containing all variations of the desired graphic symbol.

The search for a matching sequence starts at the beginning of a string and stops when the first sequence matching the expression is found, where *first* is defined to mean ‘‘begins earliest in the string’’. If the pattern permits a variable number of matching characters and thus there is more than one such sequence starting at that point, the longest such sequence is matched. For example: the BRE `"bb*"` matches the second to fourth characters of *abbbc*, and the ERE (*wee* | *week*)(*knights* | *night*) matches all ten characters of *weeknights*.

Consistent with the whole match being the longest of the leftmost matches, each subpattern, from left to right, shall match the longest possible string. For this purpose, a null string shall be considered to be longer than no match at all. For example, matching the BRE `"\(.*\).*"` against `"abcdef"`, the subexpression `"(\1)"` is `"abcdef"`, and matching the BRE `"\(a*\)*"` against `"bc"`, the subexpression `"(\1)"` is the null string.

When a multi-character collating element in a bracket expression (see Section 9.3.5 (on page 168)) is involved, the longest sequence shall be measured in characters consumed from the string to be matched; that is, the collating element counts not as one element, but as the number of characters it matches.

BRE (ERE) matching a single character

A BRE or ERE that shall match either a single character or a single collating element.

Only a BRE or ERE of this type that includes a bracket expression (see Section 9.3.5 (on page 168)) can match a collating element.

BRE (ERE) matching multiple characters

A BRE or ERE that shall match a concatenation of single characters or collating elements.

Such a BRE or ERE is made up from a BRE (ERE) matching a single character and BRE (ERE) special characters.

invalid

This section uses the term *invalid* for certain constructs or conditions. Invalid REs shall cause the utility or function using the RE to generate an error condition. When *invalid* is not used, violations of the specified syntax or semantics for REs produce undefined results: this may entail an error, enabling an extended syntax for that RE, or using the construct in error as literal characters to be matched. For example, the BRE construct `"\{1,2,3\}"` does not comply with the grammar. A conforming application cannot rely on it producing an error nor matching the literal characters `"\{1,2,3\}"`.

9.2 Regular Expression General Requirements

The requirements in this section shall apply to both basic and extended regular expressions.

The use of regular expressions is generally associated with text processing. REs (BREs and EREs) operate on text strings; that is, zero or more characters followed by an end-of-string delimiter (typically NUL). Some utilities employing regular expressions limit the processing to lines; that is, zero or more characters followed by a <newline>. In the regular expression processing described in IEEE Std 1003.1-200x, the <newline> is regarded as an ordinary character and both a period and a non-matching list can match one. The Shell and Utilities volume of IEEE Std 1003.1-200x specifies within the individual descriptions of those standard utilities employing regular expressions whether they permit matching of <newline>s; if not stated otherwise, the use of literal <newline>s or any escape sequence equivalent produces undefined results. Those utilities (like *grep*) that do not allow <newline>s to match are responsible for eliminating any <newline> from strings before matching against the RE. The *regcomp*( ) function in the System Interfaces volume of IEEE Std 1003.1-200x, however, can provide support for such processing without violating the rules of this section.

The interfaces specified in IEEE Std 1003.1-200x do not permit the inclusion of a NUL character in an RE or in the string to be matched. If during the operation of a standard utility a NUL is included in the text designated to be matched, that NUL may designate the end of the text string for the purposes of matching.

When a standard utility or function that uses regular expressions specifies that pattern matching shall be performed without regard to the case (uppercase or lowercase) of either data or patterns, then when each character in the string is matched against the pattern, not only the character, but also its case counterpart (if any), shall be matched. This definition of case-insensitive processing is intended to allow matching of multi-character collating elements as well as characters, as each character in the string is matched using both its cases. For example, in a locale where `"Ch"` is a multi-character collating element and where a matching list expression matches such elements, the RE `"[[.Ch.]]"` when matched against the string `"char"`, is in reality matched against `"ch"`, `"Ch"`, `"cH"`, and `"CH"`.

The implementation shall support any regular expression that does not exceed 256 bytes in length.

9.3 Basic Regular Expressions

9.3.1 BREs Matching a Single Character or Collating Element

A BRE ordinary character, a special character preceded by a backslash or a period, shall match a single character. A bracket expression shall match a single character or a single collating element.

9.3.2 BRE Ordinary Characters

An ordinary character is a BRE that matches itself: any character in the supported character set, except for the BRE special characters listed in Section 9.3.3.

The interpretation of an ordinary character preceded by a backslash (`'\'`) is undefined, except for:

- The characters `')'`, `'('`, `'{'`, and `'}'`
- The digits 1 to 9 inclusive (see Section 9.3.6 (on page 170))
- A character inside a bracket expression

9.3.3 BRE Special Characters

A *BRE special character* has special properties in certain contexts. Outside those contexts, or when preceded by a backslash, such a character is a BRE that matches the special character itself. The BRE special characters and the contexts in which they have their special meaning are as follows:

`. [ \`	The period, left-bracket, and backslash shall be special except when used in a bracket expression (see Section 9.3.5 (on page 168)). An expression containing a `'['` that is not preceded by a backslash and is not part of a bracket expression produces undefined results.
`*`	The asterisk shall be special except when used: • In a bracket expression • As the first character of an entire BRE (after an initial `'^'`, if any) • As the first character of a subexpression (after an initial `'^'`, if any); see Section 9.3.6 (on page 170)
`^`	The circumflex shall be special when used as: • An anchor (see Section 9.3.8 (on page 171)) • The first character of a bracket expression (see Section 9.3.5 (on page 168))
`$`	The dollar sign shall be special when used as an anchor.

9.3.4 Periods in BREs

A period (`'.'`), when used outside a bracket expression, is a BRE that shall match any character in the supported character set except NUL.

9.3.5 RE Bracket Expression

A bracket expression (an expression enclosed in square brackets, `"[ ]"`) is an RE that shall match a single collating element contained in the non-empty set of collating elements represented by the bracket expression.

The following rules and definitions apply to bracket expressions:

1. A *bracket expression* is either a matching list expression or a non-matching list expression. It consists of one or more expressions: collating elements, collating symbols, equivalence classes, character classes, or range expressions. The right-bracket (`']'`) shall lose its special meaning and represents itself in a bracket expression if it occurs first in the list (after an initial circumflex (`'^'`), if any). Otherwise, it shall terminate the bracket expression, unless it appears in a collating symbol (such as `"[.].]"`) or is the ending right-bracket for a collating symbol, equivalence class, or character class. The special characters `'.'`, `'*'`, `'['`, and `'\'` (period, asterisk, left-bracket, and backslash, respectively) shall lose their special meaning within a bracket expression.

   The character sequences `"[."`, `"[="`, and `"[:"` (left-bracket followed by a period, equals-sign, or colon) shall be special inside a bracket expression and are used to delimit collating symbols, equivalence class expressions, and character class expressions. These symbols shall be followed by a valid expression and the matching terminating sequence `".]"`, `"=]"`, or `":]"`, as described in the following items.

2. A *matching list expression* specifies a list that shall match any single-character collating element in any of the expressions represented in the list. The first character in the list shall not be the circumflex; for example, `"[abc]"` is an RE that matches any of the characters `'a'`, `'b'`, or `'c'`. It is unspecified whether a matching list expression matches a multi-character collating element that is matched by one of the expressions.

3. A *non-matching list expression* begins with a circumflex (`'^'`), and specifies a list that shall match any single-character collating element except for the expressions represented in the list after the leading circumflex. For example, `"[^abc]"` is an RE that matches any character except the characters `'a'`, `'b'`, or `'c'`. It is unspecified whether a non-matching list expression matches a multi-character collating element that is not matched by any of the expressions. The circumflex shall have this special meaning only when it occurs first in the list, immediately following the left-bracket.

4. A *collating symbol* is a collating element enclosed within bracket-period (`"[."` and `".]"`) delimiters. Collating elements are defined as described in Section 7.3.2.4 (on page 133). Conforming applications shall represent multi-character collating elements as collating symbols when it is necessary to distinguish them from a list of the individual characters that make up the multi-character collating element. For example, if the string `"ch"` is a collating element defined using the line:

   ```
   collating-element <ch-digraph> from "<c><h>"
   ```

   in the locale definition, the expression `"[[.ch.]]"` shall be treated as an RE containing the collating symbol `'ch'`, while `"[ch]"` shall be treated as an RE matching `'c'` or `'h'`. Collating symbols are recognized only inside bracket expressions. If the string is not a collating element in the current locale, the expression is invalid.

5. An *equivalence class expression* shall represent the set of collating elements belonging to an equivalence class, as described in Section 7.3.2.4 (on page 133). Only primary equivalence classes shall be recognized. The class shall be expressed by enclosing any one of the collating elements in the equivalence class within bracket-equal (`"[="` and `"=]"`) delimiters. For example, if `'a'`, `'à'`, and `'â'` belong to the same equivalence class, then `"[[=a=]b]"`, `"[[=à=]b]"`, and `"[[=â=]b]"` are each equivalent to `"[aàâb]"`. If the collating element does not belong to an equivalence class, the equivalence class expression shall be treated as a *collating symbol*.

6. A *character class expression* shall represent the union of two sets:

    a. The set of single-character collating elements whose characters belong to the character class, as defined in the *LC_CTYPE* category in the current locale.

    b. An unspecified set of multi-character collating elements.

    All character classes specified in the current locale shall be recognized. A character class expression is expressed as a character class name enclosed within bracket-colon (`"[:"` and `":]"`) delimiters.

    The following character class expressions shall be supported in all locales:

    ```
    [:alnum:]   [:cntrl:]   [:lower:]   [:space:]
    [:alpha:]   [:digit:]   [:print:]   [:upper:]
    [:blank:]   [:graph:]   [:punct:]   [:xdigit:]
    ```

    XSI In addition, character class expressions of the form:

    `[:`*`name`*`:]`

    are recognized in those locales where the *name* keyword has been given a **charclass** definition in the *LC_CTYPE* category.

7. In the POSIX locale, a range expression represents the set of collating elements that fall between two elements in the collation sequence, inclusive. In other locales, a range expression has unspecified behavior: strictly conforming applications shall not rely on whether the range expression is valid, or on the set of collating elements matched. A range expression shall be expressed as the starting point and the ending point separated by a hyphen (`'-'`).

    In the following, all examples assume the POSIX locale.

    The starting range point and the ending range point shall be a collating element or collating symbol. An equivalence class expression used as a starting or ending point of a range expression produces unspecified results. An equivalence class can be used portably within a bracket expression, but only outside the range. If the represented set of collating elements is empty, it is unspecified whether the expression matches nothing, or is treated as invalid.

    The interpretation of range expressions where the ending range point is also the starting range point of a subsequent range expression (for example, `"[a-m-o]"`) is undefined.

    The hyphen character shall be treated as itself if it occurs first (after an initial `'^'`, if any) or last in the list, or as an ending range point in a range expression. As examples, the expressions `"[-ac]"` and `"[ac-]"` are equivalent and match any of the characters `'a'`, `'c'`, or `'-'`; `"[^-ac]"` and `"[^ac-]"` are equivalent and match any characters except `'a'`, `'c'`, or `'-'`; the expression `"[%--]"` matches any of the characters between `'%'` and `'-'` inclusive; the expression `"[--@]"` matches any of the characters between `'-'` and `'@'` inclusive; and the expression `"[a--@]"` is either invalid or equivalent to `'@'`, because the letter `'a'` follows the symbol `'-'` in the POSIX locale. To use a hyphen as the starting range point, it shall either come first in the bracket expression or be specified as a collating symbol; for example, `"[][.-.]-0]"`, which matches either a right bracket or any character or collating element that collates between hyphen and 0, inclusive.

If a bracket expression specifies both `'-'` and `']'`, the `']'` shall be placed first (after the `'^'`, if any) and the `'-'` last within the bracket expression.

9.3.6 BREs Matching Multiple Characters

The following rules can be used to construct BREs matching multiple characters from BREs matching a single character:

1. The concatenation of BREs shall match the concatenation of the strings matched by each component of the BRE.

2. A *subexpression* can be defined within a BRE by enclosing it between the character pairs `"\("` and `"\)"`. Such a subexpression shall match whatever it would have matched without the `"\("` and `"\)"`, except that anchoring within subexpressions is optional behavior; see Section 9.3.8 (on page 171). Subexpressions can be arbitrarily nested.

3. The *back-reference expression* `'\n'` shall match the same (possibly empty) string of characters as was matched by a subexpression enclosed between `"\("` and `"\)"` preceding the `'\n'`. The character `'n'` shall be a digit from 1 through 9, specifying the *n*th subexpression (the one that begins with the *n*th `"\("` from the beginning of the pattern and ends with the corresponding paired `"\)"`). The expression is invalid if less than *n* subexpressions precede the `'\n'`. For example, the expression `"\(.*\)\1$"` matches a line consisting of two adjacent appearances of the same string, and the expression `"\(a\)*\1"` fails to match `'a'`. When the referenced subexpression matched more than one string, the back-referenced expression shall refer to the last matched string. If the subexpression referenced by the back-reference matches more than one string because of an asterisk (`'*'`) or an interval expression (see item (5)), the back-reference shall match the last (rightmost) of these strings.

4. When a BRE matching a single character, a subexpression, or a back-reference is followed by the special character asterisk (`'*'`), together with that asterisk it shall match what zero or more consecutive occurrences of the BRE would match. For example, `"[ab]*"` and `"[ab][ab]"` are equivalent when matching the string `"ab"`.

5. When a BRE matching a single character, a subexpression, or a back-reference is followed by an *interval expression* of the format `"\{m\}"`, `"\{m,\}"`, or `"\{m,n\}"`, together with that interval expression it shall match what repeated consecutive occurrences of the BRE would match. The values of *m* and *n* are decimal integers in the range $0 \le m \le n \le$ {RE_DUP_MAX}, where *m* specifies the exact or minimum number of occurrences and *n* specifies the maximum number of occurrences. The expression `"\{m\}"` shall match exactly *m* occurrences of the preceding BRE, `"\{m,\}"` shall match at least *m* occurrences, and `"\{m,n\}"` shall match any number of occurrences between *m* and *n*, inclusive.

   For example, in the string `"abababccccccd"` the BRE `"c\{3\}"` is matched by characters `'7'` to `'9'`, the BRE `"\(ab\)\{4,\}"` is not matched at all, and the BRE `"c\{1,3\}d"` is matched by characters ten to thirteen.

The behavior of multiple adjacent duplication symbols (`'*'` and intervals) produces undefined results.

A subexpression repeated by an asterisk (`'*'`) or an interval expression shall not match a null expression unless this is the only match for the repetition or it is necessary to satisfy the exact or minimum number of occurrences for the interval expression.

9.3.7 BRE Precedence

The order of precedence shall be as shown in the following table:

BRE Precedence (from high to low)	
Collation-related bracket symbols	`[==] [::] [..]`
Escaped characters	`\<special character>`
Bracket expression	`[]`
Subexpressions / back-references	`\(\) \n`
Single-character-BRE duplication	`* \{m,n\}`
Concatenation	
Anchoring	`^ $`

9.3.8 BRE Expression Anchoring

A BRE can be limited to matching strings that begin or end a line; this is called *anchoring*. The circumflex and dollar sign special characters shall be considered BRE anchors in the following contexts:

1. A circumflex (`'^'`) shall be an anchor when used as the first character of an entire BRE. The implementation may treat the circumflex as an anchor when used as the first character of a subexpression. The circumflex shall anchor the expression (or optionally subexpression) to the beginning of a string; only sequences starting at the first character of a string shall be matched by the BRE. For example, the BRE `"^ab"` matches `"ab"` in the string `"abcdef"`, but fails to match in the string `"cdefab"`. The BRE `"\(^ab\)"` may match the former string. A portable BRE shall escape a leading circumflex in a subexpression to match a literal circumflex.

2. A dollar sign (`'$'`) shall be an anchor when used as the last character of an entire BRE. The implementation may treat a dollar sign as an anchor when used as the last character of a subexpression. The dollar sign shall anchor the expression (or optionally subexpression) to the end of the string being matched; the dollar sign can be said to match the end-of-string following the last character.

3. A BRE anchored by both `'^'` and `'$'` shall match only an entire string. For example, the BRE `"^abcdef$"` matches strings consisting only of `"abcdef"`.

9.4 Extended Regular Expressions

The *extended regular expression* (ERE) notation and construction rules shall apply to utilities defined as using extended regular expressions; any exceptions to the following rules are noted in the descriptions of the specific utilities using EREs.

9.4.1 EREs Matching a Single Character or Collating Element

An ERE ordinary character, a special character preceded by a backslash, or a period shall match a single character. A bracket expression shall match a single character or a single collating element. An *ERE matching a single character* enclosed in parentheses shall match the same as the ERE without parentheses would have matched.

9.4.2 ERE Ordinary Characters

An *ordinary character* is an ERE that matches itself. An ordinary character is any character in the supported character set, except for the ERE special characters listed in Section 9.4.3. The interpretation of an ordinary character preceded by a backslash (`'\'`) is undefined.

9.4.3 ERE Special Characters

An *ERE special character* has special properties in certain contexts. Outside those contexts, or when preceded by a backslash, such a character shall be an ERE that matches the special character itself. The extended regular expression special characters and the contexts in which they shall have their special meaning are as follows:

`. [ \ (` The period, left-bracket, backslash, and left-parenthesis shall be special except when used in a bracket expression (see Section 9.3.5 (on page 168)). Outside a bracket expression, a left-parenthesis immediately followed by a right-parenthesis produces undefined results.

`)` The right-parenthesis shall be special when matched with a preceding left-parenthesis, both outside a bracket expression.

`* + ? {` The asterisk, plus-sign, question-mark, and left-brace shall be special except when used in a bracket expression (see Section 9.3.5 (on page 168)). Any of the following uses produce undefined results:

- If these characters appear first in an ERE, or immediately following a vertical-line, circumflex, or left-parenthesis
- If a left-brace is not part of a valid interval expression (see Section 9.4.6 (on page 173))

`|` The vertical-line is special except when used in a bracket expression (see Section 9.3.5 (on page 168)). A vertical-line appearing first or last in an ERE, or immediately following a vertical-line or a left-parenthesis, or immediately preceding a right-parenthesis, produces undefined results.

`^` The circumflex shall be special when used as:

- An anchor (see Section 9.4.9 (on page 174))
- The first character of a bracket expression (see Section 9.3.5 (on page 168))

`$` The dollar sign shall be special when used as an anchor.

9.4.4 Periods in EREs

A period (`'.'`), when used outside a bracket expression, is an ERE that shall match any character in the supported character set except NUL.

9.4.5 ERE Bracket Expression

The rules for ERE Bracket Expressions are the same as for Basic Regular Expressions; see Section 9.3.5 (on page 168).

9.4.6 EREs Matching Multiple Characters

The following rules shall be used to construct EREs matching multiple characters from EREs matching a single character:

1. A *concatenation of EREs* shall match the concatenation of the character sequences matched by each component of the ERE. A concatenation of EREs enclosed in parentheses shall match whatever the concatenation without the parentheses matches. For example, both the ERE `"cd"` and the ERE `"(cd)"` are matched by the third and fourth character of the string `"abcdefabcdef"`.

2. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character plus-sign (`'+'`), together with that plus-sign it shall match what one or more consecutive occurrences of the ERE would match. For example, the ERE `"b+(bc)"` matches the fourth to seventh characters in the string `"acabbbcde"`. And, `"[ab]+"` and `"[ab][ab]*"` are equivalent.

3. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character asterisk (`'*'`), together with that asterisk it shall match what zero or more consecutive occurrences of the ERE would match. For example, the ERE `"b*c"` matches the first character in the string `"cabbbcde"`, and the ERE `"b*cd"` matches the third to seventh characters in the string `"cabbbcdebbbbbbcdbc"`. And, `"[ab]*"` and [ab][ab] are equivalent when matching the string `"ab"`.

4. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character question-mark (`'?'`), together with that question-mark it shall match what zero or one consecutive occurrences of the ERE would match. For example, the ERE `"b?c"` matches the second character in the string `"acabbbcde"`.

5. When an ERE matching a single character or an ERE enclosed in parentheses is followed by an *interval expression* of the format `"{m}"`, `"{m,}"`, or `"{m,n}"`, together with that interval expression it shall match what repeated consecutive occurrences of the ERE would match. The values of *m* and *n* are decimal integers in the range $0 \leq m \leq n \leq$ {RE_DUP_MAX}, where *m* specifies the exact or minimum number of occurrences and *n* specifies the maximum number of occurrences. The expression `"{m}"` matches exactly *m* occurrences of the preceding ERE, `"{m,}"` matches at least *m* occurrences, and `"{m,n}"` matches any number of occurrences between *m* and *n*, inclusive.

   For example, in the string `"abababccccccd"` the ERE `"c{3}"` is matched by characters `'7'` to `'9'` and the ERE `"(ab){2,}"` is matched by characters one to six.

The behavior of multiple adjacent duplication symbols (`'+'`, `'*'`, `'?'`, and intervals) produces undefined results.

An ERE matching a single character repeated by an `'*'`, `'?'`, or an interval expression shall not match a null expression unless this is the only match for the repetition or it is necessary to satisfy the exact or minimum number of occurrences for the interval expression.

9.4.7 ERE Alternation

Two EREs separated by the special character vertical-line (`'|'`) shall match a string that is matched by either. For example, the ERE `"a((bc)|d)"` matches the string `"abc"` and the string `"ad"`. Single characters, or expressions matching single characters, separated by the vertical bar and enclosed in parentheses, shall be treated as an ERE matching a single character.

9.4.8 ERE Precedence

The order of precedence shall be as shown in the following table:

ERE Precedence (from high to low)	
Collation-related bracket symbols	`[==] [::] [..]`
Escaped characters	`\<special character>`
Bracket expression	`[]`
Grouping	`()`
Single-character-ERE duplication	`* + ? {m,n}`
Concatenation	
Anchoring	`^ $`
Alternation	`|`

For example, the ERE `"abba|cde"` matches either the string `"abba"` or the string `"cde"` (rather than the string `"abbade"` or `"abbcde"`, because concatenation has a higher order of precedence than alternation).

9.4.9 ERE Expression Anchoring

An ERE can be limited to matching strings that begin or end a line; this is called *anchoring*. The circumflex and dollar sign special characters shall be considered ERE anchors when used anywhere outside a bracket expression. This shall have the following effects:

1. A circumflex (`'^'`) outside a bracket expression shall anchor the expression or subexpression it begins to the beginning of a string; such an expression or subexpression can match only a sequence starting at the first character of a string. For example, the EREs `"^ab"` and `"(^ab)"` match `"ab"` in the string `"abcdef"`, but fail to match in the string `"cdefab"`, and the ERE `"a^b"` is valid, but can never match because the `'a'` prevents the expression `"^b"` from matching starting at the first character.

2. A dollar sign (`'$'`) outside a bracket expression shall anchor the expression or subexpression it ends to the end of a string; such an expression or subexpression can match only a sequence ending at the last character of a string. For example, the EREs `"ef$"` and `"(ef$)"` match `"ef"` in the string `"abcdef"`, but fail to match in the string `"cdefab"`, and the ERE `"e$f"` is valid, but can never match because the `'f'` prevents the expression `"e$"` from matching ending at the last character.

9.5 Regular Expression Grammar

Grammars describing the syntax of both basic and extended regular expressions are presented in this section. The grammar takes precedence over the text. See the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 1.10, Grammar Conventions.

9.5.1 BRE/ERE Grammar Lexical Conventions

The lexical conventions for regular expressions are as described in this section.

Except as noted, the longest possible token or delimiter beginning at a given point is recognized.

The following tokens are processed (in addition to those string constants shown in the grammar):

COLL_ELEM_SINGLE	Any single-character collating element, unless it is a META_CHAR.
COLL_ELEM_MULTI	Any multi-character collating element.
BACKREF	Applicable only to basic regular expressions. The character string consisting of `'\'` followed by a single-digit numeral, `'1'` to `'9'`.
DUP_COUNT	Represents a numeric constant. It shall be an integer in the range 0 ≤DUP_COUNT ≤{RE_DUP_MAX}. This token is only recognized when the context of the grammar requires it. At all other times, digits not preceded by `'\'` are treated as ORD_CHAR.
META_CHAR	One of the characters: ^ When found first in a bracket expression – When found anywhere but first (after an initial `'^'`, if any) or last in a bracket expression, or as the ending range point in a range expression] When found anywhere but first (after an initial `'^'`, if any) in a bracket expression
L_ANCHOR	Applicable only to basic regular expressions. The character `'^'` when it appears as the first character of a basic regular expression and when not QUOTED_CHAR. The `'^'` may be recognized as an anchor elsewhere; see Section 9.3.8 (on page 171).
ORD_CHAR	A character, other than one of the special characters in SPEC_CHAR.

QUOTED_CHAR	In a BRE, one of the character sequences:
	`\^ \. \* \[ \$ \\`
	In an ERE, one of the character sequences:
	`\^ \. \[ \$ \( \) |`
	`\* \+ \? \{ \\`

R_ANCHOR	(Applicable only to basic regular expressions.) The character `'$'` when it appears as the last character of a basic regular expression and when not QUOTED_CHAR. The `'$'` may be recognized as an anchor elsewhere; see Section 9.3.8 (on page 171).
SPEC_CHAR	For basic regular expressions, one of the following special characters:

`.`	Anywhere outside bracket expressions
`\`	Anywhere outside bracket expressions
`[`	Anywhere outside bracket expressions
`^`	When used as an anchor (see Section 9.3.8 (on page 171)) or when first in a bracket expression
`$`	When used as an anchor
`*`	Anywhere except first in an entire RE, anywhere in a bracket expression, directly following `"\("`, directly following an anchoring `'^'`

For extended regular expressions, shall be one of the following special characters found anywhere outside bracket expressions:

```
^    .    [    $    (    )    |
*    +    ?    {    \
```

(The close-parenthesis shall be considered special in this context only if matched with a preceding open-parenthesis.)

9.5.2 RE and Bracket Expression Grammar

This section presents the grammar for basic regular expressions, including the bracket expression grammar that is common to both BREs and EREs.

```
start_range    : end_range ’-’
               ;
end_range      : COLL_ELEM_SINGLE
               | collating_symbol
               ;
collating_symbol : Open_dot COLL_ELEM_SINGLE Dot_close
               | Open_dot COLL_ELEM_MULTI Dot_close
               | Open_dot META_CHAR Dot_close
               ;
equivalence_class : Open_equal COLL_ELEM_SINGLE Equal_close
               | Open_equal COLL_ELEM_MULTI Equal_close
               ;
character_class : Open_colon class_name Colon_close
               ;
```

The BRE grammar does not permit L_ANCHOR or R_ANCHOR inside "\(" and "\)" (which implies that ’ˆ’ and ’$’ are ordinary characters). This reflects the semantic limits on the application, as noted in Section 9.3.8 (on page 171). Implementations are permitted to extend the language to interpret ’ˆ’ and ’$’ as anchors in these locations, and as such, conforming applications cannot use unescaped ’ˆ’ and ’$’ in positions inside "\(" and "\)" that might be interpreted as anchors.

9.5.3 ERE Grammar

This section presents the grammar for extended regular expressions, excluding the bracket expression grammar.

Note: The bracket expression grammar and the associated **%token** lines are identical between BREs and EREs. It has been omitted from the ERE section to avoid unnecessary editorial duplication.

```
%token  ORD_CHAR QUOTED_CHAR DUP_COUNT
%start  extended_reg_exp
%%

/* --------------------------------------------
   Extended Regular Expression
   --------------------------------------------
*/
extended_reg_exp   :                          ERE_branch
                   | extended_reg_exp ’|’ ERE_branch
                   ;
ERE_branch         :              ERE_expression
                   | ERE_branch ERE_expression
                   ;
ERE_expression     : one_char_or_coll_elem_ERE
                   | ’ˆ’
                   | ’$’
                   | ’(’ extended_reg_exp ’)’
                   | ERE_expression ERE_dupl_symbol
                   ;
one_char_or_coll_elem_ERE  : ORD_CHAR
                   | QUOTED_CHAR
                   | ’.’
                   | bracket_expression
                   ;
```

```
ERE_dupl_symbol    : '*'
                   | '+'
                   | '?'
                   | '{' DUP_COUNT               '}'
                   | '{' DUP_COUNT ','           '}'
                   | '{' DUP_COUNT ',' DUP_COUNT '}'
                   ;
```

The ERE grammar does not permit several constructs that previous sections specify as having undefined results:

- ORD_CHAR preceded by `'\'`
- One or more *ERE_dupl_symbol*s appearing first in an ERE, or immediately following `'|'`, `'^'`, or `'('`
- `'{'` not part of a valid *ERE_dupl_symbol*
- `'|'` appearing first or last in an ERE, or immediately following `'|'` or `'('`, or immediately preceding `')'`

Implementations are permitted to extend the language to allow these. Conforming applications cannot use such constructs. |

Chapter 10

Directory Structure and Devices

10.1 Directory Structure and Files

The following directories shall exist on conforming systems and conforming applications shall make use of them only as described. Strictly conforming applications shall not assume the ability to create files in any of these directories, unless specified below.

/ The root directory.

/dev Contains **/dev/console**, **/dev/null**, and **/dev/tty**, described below.

The following directory shall exist on conforming systems and shall be used as described.

/tmp A directory made available for programs that need a place to create temporary files. Applications shall be allowed to create files in this directory, but shall not assume that such files are preserved between invocations of the application.

The following files shall exist on conforming systems and shall be both readable and writable.

/dev/null An infinite data source and data sink. Data written to **/dev/null** shall be discarded. Reads from **/dev/null** shall always return end-of-file (EOF).

/dev/tty In each process, a synonym for the controlling terminal associated with the process group of that process, if any. It is useful for programs or shell procedures that wish to be sure of writing messages to or reading data from the terminal no matter how output has been redirected. It can also be used for programs that demand the name of a file for output, when typed output is desired and it is tiresome to find out what terminal is currently in use.

The following file shall exist on conforming systems and need not be readable or writable:

/dev/console The **/dev/console** file is a generic name given to the system console (see Section 3.382 (on page 85)). It is usually linked to an implementation-defined special file. It shall provide an interface to the system console conforming to the requirements of the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 11, General Terminal Interface.

10.2 Output Devices and Terminal Types

The utilities in the Shell and Utilities volume of IEEE Std 1003.1-200x historically have been implemented on a wide range of terminal types, but a conforming implementation need not support all features of all utilities on every conceivable terminal. IEEE Std 1003.1-200x states which features are optional for certain classes of terminals in the individual utility description sections. The implementation shall document which terminal types it supports and which of these features and utilities are not supported by each terminal.

When a feature or utility is not supported on a specific terminal type, as allowed by IEEE Std 1003.1-200x, and the implementation considers such a condition to be an error preventing use of the feature or utility, the implementation shall indicate such conditions through diagnostic messages or exit status values or both (as appropriate to the specific utility description) that inform the user that the terminal type lacks the appropriate capability.

IEEE Std 1003.1-200x uses a notational convention based on historical practice that identifies some of the control characters defined in Section 7.3.1 (on page 122) in a manner easily remembered by users on many terminals. The correspondence between this ‘‘<control>-*char*’’ notation and the actual control characters is shown in the following table. When IEEE Std 1003.1-200x refers to a character by its <control>- *name*, it is referring to the actual control character shown in the Value column of the table, which is not necessarily the exact control key sequence on all terminals. Some terminals have keyboards that do not allow the direct transmission of all the non-alphanumeric characters shown. In such cases, the system documentation shall describe which data sequences transmitted by the terminal are interpreted by the system as representing the special characters.

Table 10-1 Control Character Names

Name	Value	Symbolic Name	Name	Value	Symbolic Name
<control>-A	<SOH>	<SOH>	<control>-Q	<DC1>	<DC1>
<control>-B	<STX>	<STX>	<control>-R	<DC2>	<DC2>
<control>-C	<ETX>	<ETX>	<control>-S	<DC3>	<DC3>
<control>-D	<EOT>	<EOT>	<control>-T	<DC4>	<DC4>
<control>-E	<ENQ>	<ENQ>	<control>-U	<NAK>	<NAK>
<control>-F	<ACK>	<ACK>	<control>-V	<SYN>	<SYN>
<control>-G	<BEL>	<alert>	<control>-W	<ETB>	<ETB>
<control>-H	<BS>	<backspace>	<control>-X	<CAN>	<CAN>
<control>-I	<HT>	<tab>	<control>-Y	<EM>	<EM>
<control>-J	<LF>	<linefeed>	<control>-Z	<SUB>	<SUB>
<control>-K	<VT>	<vertical-tab>	<control>-[	<ESC>	<ESC>
<control>-L	<FF>	<form-feed>	<control>-\	<FS>	<FS>
<control>-M	<CR>	<carriage-return>	<control>-]	<GS>	<GS>
<control>-N	<SO>	<SO>	<control>-^	<RS>	<RS>
<control>-O	<SI>	<SI>	<control>-_	<US>	<US>
<control>-P	<DLE>	<DLE>	<control>-?	<DEL>	<DEL>

Note: The notation uses uppercase letters for arbitrary editorial reasons. There is no implication that the keystrokes represent control-shift-letter sequences.

Chapter 11

General Terminal Interface

This chapter describes a general terminal interface that shall be provided. It shall be supported on any asynchronous communications ports if the implementation provides them. It is implementation-defined whether it supports network connections or synchronous ports, or both.

11.1 Interface Characteristics

11.1.1 Opening a Terminal Device File

When a terminal device file is opened, it normally causes the thread to wait until a connection is established. In practice, application programs seldom open these files; they are opened by special programs and become an application's standard input, output, and error files.

As described in *open*( ), opening a terminal device file with the O_NONBLOCK flag clear shall cause the thread to block until the terminal device is ready and available. If CLOCAL mode is not set, this means blocking until a connection is established. If CLOCAL mode is set in the terminal, or the O_NONBLOCK flag is specified in the *open*( ), the *open*( ) function shall return a file descriptor without waiting for a connection to be established.

11.1.2 Process Groups

A terminal may have a foreground process group associated with it. This foreground process group plays a special role in handling signal-generating input characters, as discussed in Section 11.1.9 (on page 187).

A command interpreter process supporting job control can allocate the terminal to different jobs, or process groups, by placing related processes in a single process group and associating this process group with the terminal. A terminal's foreground process group may be set or examined by a process, assuming the permission requirements are met; see *tcgetpgrp*( ) and *tcsetpgrp*( ). The terminal interface aids in this allocation by restricting access to the terminal by processes that are not in the current process group; see Section 11.1.4 (on page 184).

When there is no longer any process whose process ID or process group ID matches the process group ID of the foreground process group, the terminal shall have no foreground process group. It is unspecified whether the terminal has a foreground process group when there is a process whose process ID matches the foreground process ID, but whose process group ID does not. No actions defined in IEEE Std 1003.1-200x, other than allocation of a controlling terminal or a successful call to *tcsetpgrp*( ), cause a process group to become the foreground process group of the terminal.

11.1.3 The Controlling Terminal

A terminal may belong to a process as its controlling terminal. Each process of a session that has a controlling terminal has the same controlling terminal. A terminal may be the controlling terminal for at most one session. The controlling terminal for a session is allocated by the session leader in an implementation-defined manner. If a session leader has no controlling terminal, and opens a terminal device file that is not already associated with a session without using the O_NOCTTY option (see *open*( )), it is implementation-defined whether the terminal becomes the controlling terminal of the session leader. If a process which is not a session leader opens a terminal file, or the O_NOCTTY option is used on *open*( ), then that terminal shall not become the controlling terminal of the calling process. When a controlling terminal becomes associated with a session, its foreground process group shall be set to the process group of the session leader.

The controlling terminal is inherited by a child process during a *fork*( ) function call. A process relinquishes its controlling terminal when it creates a new session with the *setsid*( ) function; other processes remaining in the old session that had this terminal as their controlling terminal continue to have it. Upon the close of the last file descriptor in the system (whether or not it is in the current session) associated with the controlling terminal, it is unspecified whether all processes that had that terminal as their controlling terminal cease to have any controlling terminal. Whether and how a session leader can reacquire a controlling terminal after the controlling terminal has been relinquished in this fashion is unspecified. A process does not relinquish its controlling terminal simply by closing all of its file descriptors associated with the controlling terminal if other processes continue to have it open.

When a controlling process terminates, the controlling terminal is dissociated from the current session, allowing it to be acquired by a new session leader. Subsequent access to the terminal by other processes in the earlier session may be denied, with attempts to access the terminal treated as if a modem disconnect had been sensed.

11.1.4 Terminal Access Control

If a process is in the foreground process group of its controlling terminal, read operations shall be allowed, as described in Section 11.1.5 (on page 185). Any attempts by a process in a background process group to read from its controlling terminal cause its process group to be sent a SIGTTIN signal unless one of the following special cases applies: if the reading process is ignoring or blocking the SIGTTIN signal, or if the process group of the reading process is orphaned, the *read*( ) shall return −1, with *errno* set to [EIO] and no signal shall be sent. The default action of the SIGTTIN signal shall be to stop the process to which it is sent. See **<signal.h>**.

If a process is in the foreground process group of its controlling terminal, write operations shall be allowed as described in Section 11.1.8 (on page 187). Attempts by a process in a background process group to write to its controlling terminal shall cause the process group to be sent a SIGTTOU signal unless one of the following special cases applies: if TOSTOP is not set, or if TOSTOP is set and the process is ignoring or blocking the SIGTTOU signal, the process is allowed to write to the terminal and the SIGTTOU signal is not sent. If TOSTOP is set, and the process group of the writing process is orphaned, and the writing process is not ignoring or blocking the SIGTTOU signal, the *write*( ) shall return −1, with *errno* set to [EIO] and no signal shall be sent.

Certain calls that set terminal parameters are treated in the same fashion as *write*( ), except that TOSTOP is ignored; that is, the effect is identical to that of terminal writes when TOSTOP is set (see Section 11.2.5 (on page 193), *tcdrain*( ), *tcflow*( ), *tcflush*( ), *tcsendbreak*( ), *tcsetattr*( ), and *tcsetpgrp*( )).

11.1.5 Input Processing and Reading Data

A terminal device associated with a terminal device file may operate in full-duplex mode, so that data may arrive even while output is occurring. Each terminal device file has an *input queue*, associated with it, into which incoming data is stored by the system before being read by a process. The system may impose a limit, {MAX_INPUT}, on the number of bytes that may be stored in the input queue. The behavior of the system when this limit is exceeded is implementation-defined.

Two general kinds of input processing are available, determined by whether the terminal device file is in canonical mode or non-canonical mode. These modes are described in Section 11.1.6 and Section 11.1.7 (on page 186). Additionally, input characters are processed according to the **c_iflag** (see Section 11.2.2 (on page 189)) and **c_lflag** (see Section 11.2.5 (on page 193)) fields. Such processing can include *echoing*, which in general means transmitting input characters immediately back to the terminal when they are received from the terminal. This is useful for terminals that can operate in full-duplex mode.

The manner in which data is provided to a process reading from a terminal device file is dependent on whether the terminal file is in canonical or non-canonical mode, and on whether or not the O_NONBLOCK flag is set by *open*( ) or *fcntl*( ).

If the O_NONBLOCK flag is clear, then the read request shall be blocked until data is available or a signal has been received. If the O_NONBLOCK flag is set, then the read request shall be completed, without blocking, in one of three ways:

1. If there is enough data available to satisfy the entire request, the *read*( ) shall complete successfully and shall return the number of bytes read.

2. If there is not enough data available to satisfy the entire request, the *read*( ) shall complete successfully, having read as much data as possible, and shall return the number of bytes it was able to read.

3. If there is no data available, the *read*( ) shall return –1, with *errno* set to [EAGAIN].

When data is available depends on whether the input processing mode is canonical or non-canonical. The following sections, Section 11.1.6 and Section 11.1.7 (on page 186), describe each of these input processing modes.

11.1.6 Canonical Mode Input Processing

In canonical mode input processing, terminal input is processed in units of lines. A line is delimited by a newline character (NL), an end-of-file character (EOF), or an end-of-line (EOL) character. See Section 11.1.9 (on page 187) for more information on EOF and EOL. This means that a read request shall not return until an entire line has been typed or a signal has been received. Also, no matter how many bytes are requested in the *read*( ) call, at most one line shall be returned. It is not, however, necessary to read a whole line at once; any number of bytes, even one, may be requested in a *read*( ) without losing information.

If {MAX_CANON} is defined for this terminal device, it shall be a limit on the number of bytes in a line. The behavior of the system when this limit is exceeded is implementation-defined. If {MAX_CANON} is not defined, there shall be no such limit; see *pathconf*( ).

Erase and kill processing occur when either of two special characters, the ERASE and KILL characters (see Section 11.1.9 (on page 187)), is received. This processing shall affect data in the input queue that has not yet been delimited by a newline (NL), EOF, or EOL character. This undelimited data makes up the current line. The ERASE character shall delete the last character in the current line, if there is one. The KILL character shall delete all data in the current line, if there are any. The ERASE and KILL characters shall have no effect if there is no data in the current line. The ERASE and KILL characters themselves shall not be placed in the input queue.

11.1.7 Non-Canonical Mode Input Processing

In non-canonical mode input processing, input bytes are not assembled into lines, and erase and kill processing shall not occur. The values of the MIN and TIME members of the **c_cc** array are used to determine how to process the bytes received. The IEEE Std 1003.1-200x does not specify whether the setting of O_NONBLOCK takes precedence over MIN or TIME settings. Therefore, if O_NONBLOCK is set, *read*( ) may return immediately, regardless of the setting of MIN or TIME. Also, if no data is available, *read*( ) may either return 0, or return −1 with *errno* set to [EAGAIN].

MIN represents the minimum number of bytes that should be received when the *read*( ) function returns successfully. TIME is a timer of 0.1 second granularity that is used to time out bursty and short-term data transmissions. If MIN is greater than {MAX_INPUT}, the response to the request is undefined. The four possible values for MIN and TIME and their interactions are described below.

Case A: MIN>0, TIME>0

In case A, TIME serves as an inter-byte timer which shall be activated after the first byte is received. Since it is an inter-byte timer, it shall be reset after a byte is received. The interaction between MIN and TIME is as follows. As soon as one byte is received, the inter-byte timer shall be started. If MIN bytes are received before the inter-byte timer expires (remember that the timer is reset upon receipt of each byte), the read shall be satisfied. If the timer expires before MIN bytes are received, the characters received to that point shall be returned to the user. Note that if TIME expires at least one byte shall be returned because the timer would not have been enabled unless a byte was received. In this case (MIN>0, TIME>0) the read shall block until the MIN and TIME mechanisms are activated by the receipt of the first byte, or a signal is received. If data is in the buffer at the time of the *read*( ), the result shall be as if data has been received immediately after the *read*( ).

Case B: MIN>0, TIME=0

In case B, since the value of TIME is zero, the timer plays no role and only MIN is significant. A pending read shall not be satisfied until MIN bytes are received (that is, the pending read shall block until MIN bytes are received), or a signal is received. A program that uses case B to read record-based terminal I/O may block indefinitely in the read operation.

Case C: MIN=0, TIME>0

In case C, since MIN=0, TIME no longer represents an inter-byte timer. It now serves as a read timer that shall be activated as soon as the *read*( ) function is processed. A read shall be satisfied as soon as a single byte is received or the read timer expires. Note that in case C if the timer expires, no bytes shall be returned. If the timer does not expire, the only way the read can be satisfied is if a byte is received. If bytes are not received, the read shall not block indefinitely waiting for a byte; if no byte is received within TIME*0.1 seconds after the read is initiated, the *read*( ) shall return a value of zero, having read no data. If data is in the buffer at the time of the *read*( ), the timer shall be started as if data has been received immediately after the *read*( ).

Case D: MIN=0, TIME=0

The minimum of either the number of bytes requested or the number of bytes currently available shall be returned without waiting for more bytes to be input. If no characters are available, *read*( ) shall return a value of zero, having read no data.

11.1.8 Writing Data and Output Processing

When a process writes one or more bytes to a terminal device file, they are processed according to the **c_oflag** field (see Section 11.2.3 (on page 190)). The implementation may provide a buffering mechanism; as such, when a call to *write*( ) completes, all of the bytes written have been scheduled for transmission to the device, but the transmission has not necessarily completed. See *write*( ) for the effects of O_NONBLOCK on *write*( ).

11.1.9 Special Characters

Certain characters have special functions on input or output or both. These functions are summarized as follows:

INTR	Special character on input, which is recognized if the ISIG flag is set. Generates a SIGINT signal which is sent to all processes in the foreground process group for which the terminal is the controlling terminal. If ISIG is set, the INTR character shall be discarded when processed.
QUIT	Special character on input, which is recognized if the ISIG flag is set. Generates a SIGQUIT signal which is sent to all processes in the foreground process group for which the terminal is the controlling terminal. If ISIG is set, the QUIT character shall be discarded when processed.
ERASE	Special character on input, which is recognized if the ICANON flag is set. Erases the last character in the current line; see Section 11.1.6 (on page 185). It shall not erase beyond the start of a line, as delimited by an NL, EOF, or EOL character. If ICANON is set, the ERASE character shall be discarded when processed.
KILL	Special character on input, which is recognized if the ICANON flag is set. Deletes the entire line, as delimited by an NL, EOF, or EOL character. If ICANON is set, the KILL character shall be discarded when processed.
EOF	Special character on input, which is recognized if the ICANON flag is set. When received, all the bytes waiting to be read are immediately passed to the process without waiting for a newline, and the EOF is discarded. Thus, if there are no bytes waiting (that is, the EOF occurred at the beginning of a line), a byte count of zero shall be returned from the *read*( ), representing an end-of-file indication. If ICANON is set, the EOF character shall be discarded when processed.
NL	Special character on input, which is recognized if the ICANON flag is set. It is the line delimiter newline. It cannot be changed.
EOL	Special character on input, which is recognized if the ICANON flag is set. It is an additional line delimiter, like NL.
SUSP	If the ISIG flag is set, receipt of the SUSP character shall cause a SIGTSTP signal to be sent to all processes in the foreground process group for which the terminal is the controlling terminal, and the SUSP character shall be discarded when processed.
STOP	Special character on both input and output, which is recognized if the IXON (output control) or IXOFF (input control) flag is set. Can be used to suspend output temporarily. It is useful with CRT terminals to prevent output from disappearing

before it can be read. If IXON is set, the STOP character shall be discarded when processed.

START Special character on both input and output, which is recognized if the IXON (output control) or IXOFF (input control) flag is set. Can be used to resume output that has been suspended by a STOP character. If IXON is set, the START character shall be discarded when processed.

CR Special character on input, which is recognized if the ICANON flag is set; it is the carriage-return character. When ICANON and ICRNL are set and IGNCR is not set, this character shall be translated into an NL, and shall have the same effect as an NL character.

The NL and CR characters cannot be changed. It is implementation-defined whether the START and STOP characters can be changed. The values for INTR, QUIT, ERASE, KILL, EOF, EOL, and SUSP shall be changeable to suit individual tastes. Special character functions associated with changeable special control characters can be disabled individually.

If two or more special characters have the same value, the function performed when that character is received is undefined.

A special character is recognized not only by its value, but also by its context; for example, an implementation may support multi-byte sequences that have a meaning different from the meaning of the bytes when considered individually. Implementations may also support additional single-byte functions. These implementation-defined multi-byte or single-byte functions shall be recognized only if the IEXTEN flag is set; otherwise, data is received without interpretation, except as required to recognize the special characters defined in this section.

XSI If IEXTEN is set, the ERASE, KILL, and EOF characters can be escaped by a preceding '\' character, in which case no special function shall occur.

11.1.10 Modem Disconnect

If a modem disconnect is detected by the terminal interface for a controlling terminal, and if CLOCAL is not set in the **c_cflag** field for the terminal (see Section 11.2.4 (on page 192)), the SIGHUP signal shall be sent to the controlling process for which the terminal is the controlling terminal. Unless other arrangements have been made, this shall cause the controlling process to terminate (see *exit*()). Any subsequent read from the terminal device shall return the value of zero, indicating end-of-file; see *read*(). Thus, processes that read a terminal file and test for end-of-file can terminate appropriately after a disconnect. If the EIO condition as specified in *read*() also exists, it is unspecified whether on EOF condition or the [EIO] is returned. Any subsequent *write*() to the terminal device shall return −1, with *errno* set to [EIO], until the device is closed.

11.1.11 Closing a Terminal Device File

The last process to close a terminal device file shall cause any output to be sent to the device and any input to be discarded. If HUPCL is set in the control modes and the communications port supports a disconnect function, the terminal device shall perform a disconnect.

11.2 Parameters that Can be Set

11.2.1 The termios Structure

Routines that need to control certain terminal I/O characteristics shall do so by using the **termios** structure as defined in the **<termios.h>** header. The members of this structure include (but are not limited to):

Member Type	Array Size	Member Name	Description
tcflag_t		**c_iflag**	Input modes.
tcflag_t		**c_oflag**	Output modes.
tcflag_t		**c_cflag**	Control modes.
tcflag_t		**c_lflag**	Local modes.
cc_t	NCCS	**c_cc**[ ]	Control characters.

The types **tcflag_t** and **cc_t** are defined in the **<termios.h>** header. They shall be unsigned integer types.

11.2.2 Input Modes

Values of the **c_iflag** field describe the basic terminal input control, and are composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in **<termios.h>**: |

Mask Name	Description
BRKINT	Signal interrupt on break.
ICRNL	Map CR to NL on input.
IGNBRK	Ignore break condition.
IGNCR	Ignore CR.
IGNPAR	Ignore characters with parity errors.
INLCR	Map NL to CR on input.
INPCK	Enable input parity check.
ISTRIP	Strip character.
XSI IXANY	Enable any character to restart output.
IXOFF	Enable start/stop input control.
IXON	Enable start/stop output control.
PARMRK	Mark parity errors.

In the context of asynchronous serial data transmission, a break condition shall be defined as a sequence of zero-valued bits that continues for more than the time to send one byte. The entire sequence of zero-valued bits is interpreted as a single break condition, even if it continues for a time equivalent to more than one byte. In contexts other than asynchronous serial data transmission, the definition of a break condition is implementation-defined.

If IGNBRK is set, a break condition detected on input shall be ignored; that is, not put on the input queue and therefore not read by any process. If IGNBRK is not set and BRKINT is set, the break condition shall flush the input and output queues, and if the terminal is the controlling terminal of a foreground process group, the break condition shall generate a single SIGINT signal to that foreground process group. If neither IGNBRK nor BRKINT is set, a break condition shall be read as a single 0x00, or if PARMRK is set, as 0xff 0x00 0x00.

If IGNPAR is set, a byte with a framing or parity error (other than break) shall be ignored.

If PARMRK is set, and IGNPAR is not set, a byte with a framing or parity error (other than break) shall be given to the application as the three-byte sequence 0xff 0x00 X, where 0xff 0x00 is a two-byte flag preceding each sequence and X is the data of the byte received in error. To avoid ambiguity in this case, if ISTRIP is not set, a valid byte of 0xff is given to the application as 0xff 0xff. If neither PARMRK nor IGNPAR is set, a framing or parity error (other than break) shall be given to the application as a single byte 0x00.

If INPCK is set, input parity checking shall be enabled. If INPCK is not set, input parity checking shall be disabled, allowing output parity generation without input parity errors. Note that whether input parity checking is enabled or disabled is independent of whether parity detection is enabled or disabled (see Section 11.2.4 (on page 192)). If parity detection is enabled but input parity checking is disabled, the hardware to which the terminal is connected shall recognize the parity bit, but the terminal special file shall not check whether or not this bit is correctly set.

If ISTRIP is set, valid input bytes shall first be stripped to seven bits; otherwise, all eight bits shall be processed.

If INLCR is set, a received NL character shall be translated into a CR character. If IGNCR is set, a received CR character shall be ignored (not read). If IGNCR is not set and ICRNL is set, a received CR character shall be translated into an NL character.

XSI If IXANY is set, any input character shall restart output that has been suspended.

If IXON is set, start/stop output control shall be enabled. A received STOP character shall suspend output and a received START character shall restart output. When IXON is set, START and STOP characters are not read, but merely perform flow control functions. When IXON is not set, the START and STOP characters shall be read.

If IXOFF is set, start/stop input control shall be enabled. The system shall transmit STOP characters, which are intended to cause the terminal device to stop transmitting data, as needed to prevent the input queue from overflowing and causing implementation-defined behavior, and shall transmit START characters, which are intended to cause the terminal device to resume transmitting data, as soon as the device can continue transmitting data without risk of overflowing the input queue. The precise conditions under which STOP and START characters are transmitted are implementation-defined.

The initial input control value after *open*( ) is implementation-defined.

11.2.3 Output Modes

The **c_oflag** field specifies the terminal interface's treatment of output, and is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in **<termios.h>**:

Mask Name	Description
OPOST	Perform output processing.
ONLCR	Map NL to CR-NL on output.
OCRNL	Map CR to NL on output.
ONOCR	No CR output at column 0.
ONLRET	NL performs CR function.
OFILL	Use fill characters for delay.
OFDEL	Fill is DEL, else NUL.
NLDLY	Select newline delays:
NL0	Newline character type 0.
NL1	Newline character type 1.
CRDLY	Select carriage-return delays:
CR0	Carriage-return delay type 0.
CR1	Carriage-return delay type 1.
CR2	Carriage-return delay type 2.
CR3	Carriage-return delay type 3.
TABDLY	Select horizontal-tab delays:
TAB0	Horizontal-tab delay type 0.
TAB1	Horizontal-tab delay type 1.
TAB2	Horizontal-tab delay type 2.
TAB3	Expand tabs to spaces.
BSDLY	Select backspace delays:
BS0	Backspace-delay type 0.
BS1	Backspace-delay type 1.
VTDLY	Select vertical-tab delays:
VT0	Vertical-tab delay type 0.
VT1	Vertical-tab delay type 1.
FFDLY	Select form-feed delays:
FF0	Form-feed delay type 0.
FF1	Form-feed delay type 1.

If OPOST is set, output data shall be post-processed as described below, so that lines of text are modified to appear appropriately on the terminal device; otherwise, characters shall be transmitted without change.

XSI If ONLCR is set, the NL character shall be transmitted as the CR-NL character pair. If OCRNL is set, the CR character shall be transmitted as the NL character. If ONOCR is set, no CR character shall be transmitted when at column 0 (first position). If ONLRET is set, the NL character is assumed to do the carriage-return function; the column pointer shall be set to 0 and the delays specified for CR shall be used. Otherwise, the NL character is assumed to do just the line-feed function; the column pointer remains unchanged. The column pointer shall also be set to 0 if the CR character is actually transmitted.

The delay bits specify how long transmission stops to allow for mechanical or other movement when certain characters are sent to the terminal. In all cases a value of 0 shall indicate no delay. If OFILL is set, fill characters shall be transmitted for delay instead of a timed delay. This is useful for high baud rate terminals which need only a minimal delay. If OFDEL is set, the fill character shall be DEL; otherwise, NUL.

If a form-feed or vertical-tab delay is specified, it shall last for about 2 seconds.

New-line delay shall last about 0.10 seconds. If ONLRET is set, the carriage-return delays shall be used instead of the newline delays. If OFILL is set, two fill characters shall be transmitted.

Carriage-return delay type 1 shall be dependent on the current column position, type 2 shall be about 0.10 seconds, and type 3 shall be about 0.15 seconds. If OFILL is set, delay type 1 shall transmit two fill characters, and type 2, four fill characters.

Horizontal-tab delay type 1 shall be dependent on the current column position. Type 2 shall be about 0.10 seconds. Type 3 specifies that tabs shall be expanded into spaces. If OFILL is set, two fill characters shall be transmitted for any delay.

Backspace delay shall last about 0.05 seconds. If OFILL is set, one fill character shall be transmitted.

The actual delays depend on line speed and system load.

The initial output control value after *open*( ) is implementation-defined.

11.2.4 Control Modes

The **c_cflag** field describes the hardware control of the terminal, and is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in **<termios.h>**; not all values specified are required to be supported by the underlying hardware:

Mask Name	Description
CLOCAL	Ignore modem status lines.
CREAD	Enable receiver.
CSIZE	Number of bits transmitted or received per byte:
CS5	5 bits
CS6	6 bits
CS7	7 bits
CS8	8 bits.
CSTOPB	Send two stop bits, else one.
HUPCL	Hang up on last close.
PARENB	Parity enable.
PARODD	Odd parity, else even.

In addition, the input and output baud rates are stored in the **termios** structure. The symbols in the following table are defined in **<termios.h>**. Not all values specified are required to be supported by the underlying hardware.

Name	Description	Name	Description
B0	Hang up	B600	600 baud
B50	50 baud	B1200	1200 baud
B75	75 baud	B1800	1800 baud
B110	110 baud	B2400	2400 baud
B134	134.5 baud	B4800	4800 baud
B150	150 baud	B9600	9600 baud
B200	200 baud	B19200	19200 baud
B300	300 baud	B38400	38400 baud

The following functions are provided for getting and setting the values of the input and output baud rates in the **termios** structure: *cfgetispeed*( ), *cfgetospeed*( ), *cfsetispeed*( ), and *cfsetospeed*( ). The effects on the terminal device shall not become effective and not all errors need be detected until the *tcsetattr*( ) function is successfully called.

The CSIZE bits shall specify the number of transmitted or received bits per byte. If ISTRIP is not set, the value of all the other bits is unspecified. If ISTRIP is set, the value of all but the 7 low-order bits shall be zero, but the value of any other bits beyond CSIZE is unspecified when read. CSIZE shall not include the parity bit, if any. If CSTOPB is set, two stop bits shall be used; otherwise, one stop bit. For example, at 110 baud, two stop bits are normally used.

If CREAD is set, the receiver shall be enabled; otherwise, no characters shall be received.

If PARENB is set, parity generation and detection shall be enabled and a parity bit is added to each byte. If parity is enabled, PARODD shall specify odd parity if set; otherwise, even parity shall be used.

If HUPCL is set, the modem control lines for the port shall be lowered when the last process with the port open closes the port or the process terminates. The modem connection shall be broken.

If CLOCAL is set, a connection shall not depend on the state of the modem status lines. If CLOCAL is clear, the modem status lines shall be monitored.

Under normal circumstances, a call to the *open*( ) function shall wait for the modem connection to complete. However, if the O_NONBLOCK flag is set (see *open*( )) or if CLOCAL has been set, the *open*( ) function shall return immediately without waiting for the connection.

If the object for which the control modes are set is not an asynchronous serial connection, some of the modes may be ignored; for example, if an attempt is made to set the baud rate on a network connection to a terminal on another host, the baud rate need not be set on the connection between that terminal and the machine to which it is directly connected.

The initial hardware control value after *open*( ) is implementation-defined.

11.2.5 Local Modes

The **c_lflag** field of the argument structure is used to control various functions. It is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in **<termios.h>**; not all values specified are required to be supported by the underlying hardware:

Mask Name	Description
ECHO	Enable echo.
ECHOE	Echo ERASE as an error correcting backspace.
ECHOK	Echo KILL.
ECHONL	Echo <newline>.
ICANON	Canonical input (erase and kill processing).
IEXTEN	Enable extended (implementation-defined) functions.
ISIG	Enable signals.
NOFLSH	Disable flush after interrupt, quit or suspend.
TOSTOP	Send SIGTTOU for background output.

If ECHO is set, input characters shall be echoed back to the terminal. If ECHO is clear, input characters shall not be echoed.

If ECHOE and ICANON are set, the ERASE character shall cause the terminal to erase, if possible, the last character in the current line from the display. If there is no character to erase, an implementation may echo an indication that this was the case, or do nothing.

If ECHOK and ICANON are set, the KILL character shall either cause the terminal to erase the line from the display or shall echo the newline character after the KILL character.

If ECHONL and ICANON are set, the newline character shall be echoed even if ECHO is not set.

If ICANON is set, canonical processing shall be enabled. This enables the erase and kill edit functions, and the assembly of input characters into lines delimited by NL, EOF, and EOL, as described in Section 11.1.6 (on page 185).

If ICANON is not set, read requests shall be satisfied directly from the input queue. A read shall not be satisfied until at least MIN bytes have been received or the timeout value TIME expired between bytes. The time value represents tenths of a second. See Section 11.1.7 (on page 186) for more details.

If IEXTEN is set, implementation-defined functions shall be recognized from the input data. It is implementation-defined how IEXTEN being set interacts with ICANON, ISIG, IXON, or IXOFF. If IEXTEN is not set, implementation-defined functions shall not be recognized and the corresponding input characters are processed as described for ICANON, ISIG, IXON, and IXOFF.

If ISIG is set, each input character shall be checked against the special control characters INTR, QUIT, and SUSP. If an input character matches one of these control characters, the function associated with that character shall be performed. If ISIG is not set, no checking shall be done. Thus these special input functions are possible only if ISIG is set.

If NOFLSH is set, the normal flush of the input and output queues associated with the INTR, QUIT, and SUSP characters shall not be done.

If TOSTOP is set, the signal SIGTTOU shall be sent to the process group of a process that tries to write to its controlling terminal if it is not in the foreground process group for that terminal. This signal, by default, stops the members of the process group. Otherwise, the output generated by that process shall be output to the current output stream. Processes that are blocking or ignoring SIGTTOU signals are excepted and allowed to produce output, and the SIGTTOU signal shall not be sent.

The initial local control value after *open*( ) is implementation-defined.

11.2.6 Special Control Characters

The special control character values shall be defined by the array **c_cc**. The subscript name and description for each element in both canonical and non-canonical modes are as follows:

Subscript Usage		
Canonical Mode	**Non-Canonical Mode**	**Description**
VEOF		EOF character
VEOL		EOL character
VERASE		ERASE character
VINTR	VINTR	INTR character
VKILL		KILL character
	VMIN	MIN value
VQUIT	VQUIT	QUIT character
VSUSP	VSUSP	SUSP character
	VTIME	TIME value
VSTART	VSTART	START character
VSTOP	VSTOP	STOP character

The subscript values are unique, except that the VMIN and VTIME subscripts may have the same values as the VEOF and VEOL subscripts, respectively.

Implementations that do not support changing the START and STOP characters may ignore the character values in the **c_cc** array indexed by the VSTART and VSTOP subscripts when *tcsetattr*( ) is called, but shall return the value in use when *tcgetattr*( ) is called.

The initial values of all control characters are implementation-defined.

If the value of one of the changeable special control characters (see Section 11.1.9 (on page 187)) is _POSIX_VDISABLE, that function shall be disabled; that is, no input data is recognized as the disabled special character. If ICANON is not set, the value of _POSIX_VDISABLE has no special meaning for the VMIN and VTIME entries of the **c_cc** array.

Chapter 12

Utility Conventions

12.1 Utility Argument Syntax

This section describes the argument syntax of the standard utilities and introduces terminology used throughout IEEE Std 1003.1-200x for describing the arguments processed by the utilities.

Within IEEE Std 1003.1-200x, a special notation is used for describing the syntax of a utility's arguments. Unless otherwise noted, all utility descriptions use this notation, which is illustrated by this example (see the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.9.1, Simple Commands):

```
utility_name[−a][−b][−c option_argument]
    [−d|−e][−foption_argument][operand...]
```

The notation used for the SYNOPSIS sections imposes requirements on the implementors of the standard utilities and provides a simple reference for the application developer or system user.

1. The utility in the example is named *utility_name*. It is followed by *options*, *option-arguments*, and *operands*. The arguments that consist of hyphens and single letters or digits, such as `'a'`, are known as *options* (or, historically, *flags*). Certain options are followed by an *option-argument*, as shown with [−**c** *option_argument*]. The arguments following the last options and option-arguments are named *operands*.

2. Option-arguments are sometimes shown separated from their options by <blank>s, sometimes directly adjacent. This reflects the situation that in some cases an option-argument is included within the same argument string as the option; in most cases it is the next argument. The Utility Syntax Guidelines in Section 12.2 (on page 199) require that the option be a separate argument from its option-argument, but there are some exceptions in IEEE Std 1003.1-200x to ensure continued operation of historical applications:

   a. If the SYNOPSIS of a standard utility shows a space character between an option and option-argument (as with [−**c** *option_argument*] in the example), a conforming application shall use separate arguments for that option and its option-argument.

   b. If a space character is not shown (as with [−**f***option_argument*] in the example), a conforming application shall place an option and its option-argument directly adjacent in the same argument string, without intervening <blank>s.

   c. Notwithstanding the preceding requirements on conforming applications, a conforming system shall permit, but shall not require, an application to specify options and option-arguments as separate arguments whether or not a space character is shown on the synopsis line, XSI except in those cases (marked with the XSI portability warning) where an option-argument is optional and no separation can be used.

   d. A standard utility may also be implemented to operate correctly when the required separation into multiple arguments is violated by a non-conforming application.

   In summary, the following table shows allowable combinations:

	SYNOPSIS Shows:		
	−a *arg*	−b*arg*	−c[*arg*]
Conforming application shall use:	−a *arg*	−b*arg*	N/A
System shall support:	−a *arg*	−b*arg*	−c*arg* or −c
System may support:	−a*arg*	−b *arg*	

3. Options are usually listed in alphabetical order unless this would make the utility description more confusing. There are no implied relationships between the options based upon the order in which they appear, unless otherwise stated in the OPTIONS section, or unless the exception in Guideline 11 of Section 12.2 (on page 199) applies. If an option that does not have option-arguments is repeated, the results are undefined, unless otherwise stated.

4. Frequently, names of parameters that require substitution by actual values are shown with embedded underscores. Alternatively, parameters are shown as follows:

   <*parameter name*>

   The angle brackets are used for the symbolic grouping of a phrase representing a single parameter and conforming applications shall not include them in data submitted to the utility.

5. When a utility has only a few permissible options, they are sometimes shown individually, as in the example. Utilities with many flags generally show all of the individual flags (that do not take option-arguments) grouped, as in:

   utility_name **[**−abcDxyz**][**−p *arg***][***operand***]**

   Utilities with very complex arguments may be shown as follows:

   utility_name **[**options**][***operands***]**

6. Unless otherwise specified, whenever an operand or option-argument is, or contains, a numeric value:

   - The number is interpreted as a decimal integer.
   - Numerals in the range 0 to 2 147 483 647 are syntactically recognized as numeric values.
   - When the utility description states that it accepts negative numbers as operands or option-arguments, numerals in the range −2 147 483 647 to 2 147 483 647 are syntactically recognized as numeric values.
   - Ranges greater than those listed here are allowed.

   This does not mean that all numbers within the allowable range are necessarily semantically correct. A standard utility that accepts an option-argument or operand that is to be interpreted as a number, and for which a range of values smaller than that shown above is permitted by the IEEE Std 1003.1-200x, describes that smaller range along with the description of the option-argument or operand. If an error is generated, the utility's diagnostic message shall indicate that the value is out of the supported range, not that it is syntactically incorrect.

7. Arguments or option-arguments enclosed in the '[' and ']' notation are optional and can be omitted. Conforming applications shall not include the '[' and ']' symbols in data submitted to the utility.

8. Arguments separated by the '|' vertical bar notation are mutually-exclusive. Conforming applications shall not include the '|' symbol in data submitted to the utility.

Alternatively, mutually-exclusive options and operands may be listed with multiple synopsis lines. For example:

```
utility_name -d[-a][-c option_argument][operand...]
utility_name[-a][-b][operand...]
```

When multiple synopsis lines are given for a utility, it is an indication that the utility has mutually-exclusive arguments. These mutually-exclusive arguments alter the functionality of the utility so that only certain other arguments are valid in combination with one of the mutually-exclusive arguments. Only one of the mutually-exclusive arguments is allowed for invocation of the utility. Unless otherwise stated in an accompanying OPTIONS section, the relationships between arguments depicted in the SYNOPSIS sections are mandatory requirements placed on conforming applications. The use of conflicting mutually-exclusive arguments produces undefined results, unless a utility description specifies otherwise. When an option is shown without the '[' and ']' brackets, it means that option is required for that version of the SYNOPSIS. However, it is not required to be the first argument, as shown in the example above, unless otherwise stated.

9. Ellipses (`"..."`) are used to denote that one or more occurrences of an option or operand are allowed. When an option or an operand followed by ellipses is enclosed in brackets, zero or more options or operands can be specified. The forms:

```
utility_name -f option_argument...[operand...]
utility_name [-g option_argument]...[operand...]
```

   indicate that multiple occurrences of the option and its option-argument preceding the ellipses are valid, with semantics as indicated in the OPTIONS section of the utility. (See also Guideline 11 in Section 12.2.) In the first example, each option-argument requires a preceding **−f** and at least one **−f** *option_argument* must be given.

10. When the synopsis line is too long to be printed on a single line in the Shell and Utilities volume of IEEE Std 1003.1-200x, the indented lines following the initial line are continuation lines. An actual use of the command would appear on a single logical line.

12.2 Utility Syntax Guidelines

The following guidelines are established for the naming of utilities and for the specification of options, option-arguments, and operands. The *getopt*( ) function in the System Interfaces volume of IEEE Std 1003.1-200x assists utilities in handling options and operands that conform to these guidelines.

Operands and option-arguments can contain characters not specified in the portable character set.

The guidelines are intended to provide guidance to the authors of future utilities, such as those written specific to a local system or that are components of a larger application. Some of the standard utilities do not conform to all of these guidelines; in those cases, the OPTIONS sections describe the deviations.

Guideline 1: Utility names should be between two and nine characters, inclusive.

Guideline 2: Utility names should include lowercase letters (the **lower** character classification) and digits only from the portable character set.

Guideline 3: Each option name should be a single alphanumeric character (the **alnum** character classification) from the portable character set. The **−W** (capital-W) option shall be reserved for vendor options.

Multi-digit options should not be allowed.

Guideline 4: All options should be preceded by the ’−’ delimiter character.

Guideline 5: Options without option-arguments should be accepted when grouped behind one ’−’ delimiter.

Guideline 6: Each option and option-argument should be a separate argument, except as noted in Section 12.1 (on page 197), item (2).

Guideline 7: Option-arguments should not be optional.

Guideline 8: When multiple option-arguments are specified to follow a single option, they should be presented as a single argument, using commas within that argument or <blank>s within that argument to separate them.

Guideline 9: All options should precede operands on the command line.

Guideline 10: The argument −− should be accepted as a delimiter indicating the end of options. Any following arguments should be treated as operands, even if they begin with the ’−’ character. The −− argument should not be used as an option or as an operand.

Guideline 11: The order of different options relative to one another should not matter, unless the options are documented as mutually-exclusive and such an option is documented to override any incompatible options preceding it. If an option that has option-arguments is repeated, the option and option-argument combinations should be interpreted in the order specified on the command line.

Guideline 12: The order of operands may matter and position-related interpretations should be determined on a utility-specific basis.

Guideline 13: For utilities that use operands to represent files to be opened for either reading or writing, the ’−’ operand should be used only to mean standard input (or standard output when it is clear from context that an output file is being specified).

The utilities in the Shell and Utilities volume of IEEE Std 1003.1-200x that claim conformance to these guidelines shall conform completely to these guidelines as if these guidelines contained the term ‘‘shall’’ instead of ‘‘should’’. On some implementations, the utilities accept usage in violation of these guidelines for backward compatibility as well as accepting the required form.

It is recommended that all future utilities and applications use these guidelines to enhance user portability. The fact that some historical utilities could not be changed (to avoid breaking existing applications) should not deter this future goal.

Chapter 13

Headers

This chapter describes the contents of headers.

Headers contain function prototypes, the definition of symbolic constants, common structures, preprocessor macros, and defined types. Each function in the System Interfaces volume of IEEE Std 1003.1-200x specifies the headers that an application shall include in order to use that function. In most cases, only one header is required. These headers are present on an application development system; they need not be present on the target execution system.

13.1 Format of Entries

The entries in this chapter are based on a common format as follows. The only sections relating to conformance are the SYNOPSIS and DESCRIPTION.

NAME

This section gives the name or names of the entry and briefly states its purpose.

SYNOPSIS

This section summarizes the use of the entry being described.

DESCRIPTION

This section describes the functionality of the header.

APPLICATION USAGE

This section is non-normative.

This section gives warnings and advice to application writers about the entry. In the event of conflict between warnings and advice and a normative part of this volume of IEEE Std 1003.1-200x, the normative material is to be taken as correct.

RATIONALE

This section is non-normative.

This section contains historical information concerning the contents of this volume of IEEE Std 1003.1-200x and why features were included or discarded by the standard developers.

FUTURE DIRECTIONS

This section is non-normative.

This section provides comments which should be used as a guide to current thinking; there is not necessarily a commitment to adopt these future directions.

SEE ALSO

This section is non-normative.

This section gives references to related information.

CHANGE HISTORY

This section is non-normative.

This section shows the derivation of the entry and any significant changes that have been made to it.

NAME

aio.h — asynchronous input and output (**REALTIME**)

SYNOPSIS

AIO

```
#include <aio.h>
```

DESCRIPTION

The **<aio.h>** header shall define the **aiocb** structure which shall include at least the following members:

`int`	`aio_fildes`	File descriptor.
`off_t`	`aio_offset`	File offset.
`volatile void`	`*aio_buf`	Location of buffer.
`size_t`	`aio_nbytes`	Length of transfer.
`int`	`aio_reqprio`	Request priority offset.
`struct sigevent`	`aio_sigevent`	Signal number and value.
`int`	`aio_lio_opcode`	Operation to be performed.

This header shall also include the following constants:

AIO_CANCELED	A return value indicating that all requested operations have been canceled.
AIO_NOTCANCELED	A return value indicating that some of the requested operations could not be canceled since they are in progress.
AIO_ALLDONE	A return value indicating that none of the requested operations could be canceled since they are already complete.
LIO_WAIT	A *lio_listio*( ) synchronization operation indicating that the calling thread is to suspend until the *lio_listio*( ) operation is complete.
LIO_NOWAIT	A *lio_listio*( ) synchronization operation indicating that the calling thread is to continue execution while the *lio_listio*( ) operation is being performed, and no notification is given when the operation is complete.
LIO_READ	A *lio_listio*( ) element operation option requesting a read.
LIO_WRITE	A *lio_listio*( ) element operation option requesting a write.
LIO_NOP	A *lio_listio*( ) element operation option indicating that no transfer is requested.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int      aio_cancel(int, struct aiocb *);
int      aio_error(const struct aiocb *);
int      aio_fsync(int, struct aiocb *);
int      aio_read(struct aiocb *);
ssize_t  aio_return(struct aiocb *);
int      aio_suspend(const struct aiocb *const[], int,
             const struct timespec *);
int      aio_write(struct aiocb *);
int      lio_listio(int, struct aiocb *restrict const[restrict], int,
             struct sigevent *restrict);
```

Inclusion of the **<aio.h>** header may make visible symbols defined in the headers **<fcntl.h>**, **<signal.h>**, **<sys/types.h>**, and **<time.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<fcntl.h>, **<signal.h>**, **<sys/types.h>**, **<time.h>**, the System Interfaces volume of IEEE Std 1003.1-200x, *fsync*( ), *lseek*( ), *read*( ), *write*( )

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The **<aio.h>** header is marked as part of the Asynchronous Input and Output option.

The description of the constants is expanded.

The **restrict** keyword is added to the prototype for *lio_listio*( ).

NAME

arpa/inet.h — definitions for internet operations

SYNOPSIS

```
#include <arpa/inet.h>
```

DESCRIPTION

The **in_port_t** and **in_addr_t** types shall be defined as described in **<netinet/in.h>**.

The **in_addr** structure shall be defined as described in **<netinet/in.h>**.

IP6 The INET_ADDRSTRLEN and INET6_ADDRSTRLEN macros shall be defined as described in **<netinet/in.h>**.

The following shall either be declared as functions, defined as macros, or both. If functions are declared, function prototypes shall be provided.

```
uint32_t htonl(uint32_t);
uint16_t htons(uint16_t);
uint32_t ntohl(uint32_t);
uint16_t ntohs(uint16_t);
```

The **uint32_t** and **uint16_t** types shall be defined as described in **<inttypes.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
in_addr_t    inet_addr(const char *);
char        *inet_ntoa(struct in_addr);
const char  *inet_ntop(int, const void *restrict, char *restrict,
                 socklen_t);
int          inet_pton(int, const char *restrict, void *restrict);
```

Inclusion of the **<arpa/inet.h>** header may also make visible all symbols from **<netinet/in.h>** and **<inttypes.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<netinet/in.h>, **<inttypes.h>**, the System Interfaces volume of IEEE Std 1003.1-200x, *htonl*( ), *inet_addr*( )

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the prototypes for *inet_ntop*( ) and *inet_pton*( ).

NAME

assert.h — verify program assertion

SYNOPSIS

```
#include <assert.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The **<assert.h>** header shall define the *assert*( ) macro. It refers to the macro NDEBUG which is not defined in the header. If NDEBUG is defined as a macro name before the inclusion of this header, the *assert*( ) macro shall be defined simply as:

```
#define assert(ignore)((void) 0)
```

Otherwise, the macro behaves as described in *assert*( ).

The *assert*( ) macro shall be redefined according to the current state of NDEBUG each time **<assert.h>** is included.

The *assert*( ) macro shall be implemented as a macro, not as a function. If the macro definition is suppressed in order to access an actual function, the behavior is undefined.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std 1003.1-200x, *assert*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The definition of the *assert*( ) macro is changed for alignment with the ISO/IEC 9899:1999 standard.

NAME

complex.h — complex arithmetic

SYNOPSIS

```
#include <complex.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The **<complex.h>** header shall define the following macros:

complex	Expands to **_Complex**.
_Complex_I	Expands to a constant expression of type **const float _Complex**, with the value of the imaginary unit (that is, a number such that $i^2=-1$).
imaginary	Expands to **_Imaginary**.
_Imaginary_I	Expands to a constant expression of type **const float _Imaginary** with the value of the imaginary unit.
I	Expands to either _Imaginary_I or _Complex_I. If _Imaginary_I is not defined, I expands to _Complex_I.

The macros imaginary and _Imaginary_I shall be defined if and only if the implementation supports imaginary types.

An application may undefine and then, perhaps, redefine the complex, imaginary, and I macros.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
double               cabs(double complex);
float                cabsf(float complex);
long double          cabsl(long double complex);
double complex       cacos(double complex);
float complex        cacosf(float complex);
double complex       cacosh(double complex);
float complex        cacoshf(float complex);
long double complex  cacoshl(long double complex);
long double complex  cacosl(long double complex);
double               carg(double complex);
float                cargf(float complex);
long double          cargl(long double complex);
double complex       casin(double complex);
float complex        casinf(float complex);
double complex       casinh(double complex);
float complex        casinhf(float complex);
long double complex  casinhl(long double complex);
long double complex  casinl(long double complex);
double complex       catan(double complex);
float complex        catanf(float complex);
double complex       catanh(double complex);
float complex        catanhf(float complex);
long double complex  catanhl(long double complex);
long double complex  catanl(long double complex);
```

```
double complex       ccos(double complex);
float complex        ccosf(float complex);
double complex       ccosh(double complex);
float complex        ccoshf(float complex);
long double complex  ccoshl(long double complex);
long double complex  ccosl(long double complex);
double complex       cexp(double complex);
float complex        cexpf(float complex);
long double complex  cexpl(long double complex);
double               cimag(double complex);
float                cimagf(float complex);
long double          cimagl(long double complex);
double complex       clog(double complex);
float complex        clogf(float complex);
long double complex  clogl(long double complex);
double complex       conj(double complex);
float complex        conjf(float complex);
long double complex  conjl(long double complex);
double complex       cpow(double complex, double complex);
float complex        cpowf(float complex, float complex);
long double complex  cpowl(long double complex, long double complex);
double complex       cproj(double complex);
float complex        cprojf(float complex);
long double complex  cprojl(long double complex);
double               creal(double complex);
float                crealf(float complex);
long double          creall(long double complex);
double complex       csin(double complex);
float complex        csinf(float complex);
double complex       csinh(double complex);
float complex        csinhf(float complex);
long double complex  csinhl(long double complex);
long double complex  csinl(long double complex);
double complex       csqrt(double complex);
float complex        csqrtf(float complex);
long double complex  csqrtl(long double complex);
double complex       ctan(double complex);
float complex        ctanf(float complex);
double complex       ctanh(double complex);
float complex        ctanhf(float complex);
long double complex  ctanhl(long double complex);
long double complex  ctanl(long double complex);
```

APPLICATION USAGE

Values are interpreted as radians, not degrees.

RATIONALE

The choice of *I* instead of *i* for the imaginary unit concedes to the widespread use of the identifier *i* for other purposes. The application can use a different identifier, say *j*, for the imaginary unit by following the inclusion of the **<complex.h>** header with:

```
#undef I
#define j _Imaginary_I
```

An *I* suffix to designate imaginary constants is not required, as multiplication by *I* provides a sufficiently convenient and more generally useful notation for imaginary terms. The corresponding real type for the imaginary unit is **float**, so that use of *I* for algorithmic or notational convenience will not result in widening types.

On systems with imaginary types, the application has the ability to control whether use of the macro I introduces an imaginary type, by explicitly defining I to be _Imaginary_I or _Complex_I. Disallowing imaginary types is useful for some applications intended to run on implementations without support for such types.

The macro _Imaginary_I provides a test for whether imaginary types are supported.

The *cis*( ) function (*cos*(*x*) + *I***sin*(*x*)) was considered but rejected because its implementation is easy and straightforward, even though some implementations could compute sine and cosine more efficiently in tandem.

FUTURE DIRECTIONS

The following function names and the same names suffixed with *f* or *l* are reserved for future use, and may be added to the declarations in the **<complex.h>** header.

cerf( ) *cexpm1( )* *clog2( )*
cerfc( ) *clog10( )* *clgamma( )*
cexp2( ) *clog1p( )* *ctgamma( )*

CHANGE HISTORY

First released in Issue 6. Included for alignment with the ISO / IEC 9899: 1999 standard.

NAME

cpio.h — cpio archive values

SYNOPSIS

XSI

```
#include <cpio.h>
```

DESCRIPTION

Values needed by the *c_mode* field of the *cpio* archive format are described as follows:

Name	Description	Value (Octal)
C_IRUSR	Read by owner.	0000400
C_IWUSR	Write by owner.	0000200
C_IXUSR	Execute by owner.	0000100
C_IRGRP	Read by group.	0000040
C_IWGRP	Write by group.	0000020
C_IXGRP	Execute by group.	0000010
C_IROTH	Read by others.	0000004
C_IWOTH	Write by others.	0000002
C_IXOTH	Execute by others.	0000001
C_ISUID	Set user ID.	0004000
C_ISGID	Set group ID.	0002000
C_ISVTX	On directories, restricted deletion flag.	0001000
C_ISDIR	Directory.	0040000
C_ISFIFO	FIFO.	0010000
C_ISREG	Regular file.	0100000
C_ISBLK	Block special.	0060000
C_ISCHR	Character special.	0020000
C_ISCTG	Reserved.	0110000
C_ISLNK	Symbolic link.	0120000
C_ISSOCK	Socket.	0140000

The header shall define the symbolic constant:

```
MAGIC    "070707"
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The Shell and Utilities volume of IEEE Std 1003.1-200x, *pax*

CHANGE HISTORY

First released in Issue 3 of the Headers Interface, Issue 3 specification. Derived from the POSIX.1-1988 standard.

Issue 6

The SEE ALSO is updated to refer to *pax*, since the *cpio* utility is not included in the Shell and Utilities volume of IEEE Std 1003.1-200x.

NAME

ctype.h — character types

SYNOPSIS

```
#include <ctype.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of these symbols in this header.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
      int   isalnum(int);
      int   isalpha(int);
XSI   int   isascii(int);
      int   isblank(int);
      int   iscntrl(int);
      int   isdigit(int);
      int   isgraph(int);
      int   islower(int);
      int   isprint(int);
      int   ispunct(int);
      int   isspace(int);
      int   isupper(int);
      int   isxdigit(int);
XSI   int   toascii(int);
      int   tolower(int);
      int   toupper(int);
```

The following are defined as macros:

```
XSI   int   _toupper(int);
      int   _tolower(int);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<locale.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *isalnum*( ), *isalpha*( ), *isascii*( ), *iscntrl*( ), *isdigit*( ), *isgraph*( ), *islower*( ), *isprint*( ), *ispunct*( ), *isspace*( ), *isupper*( ), *isxdigit*( ), *mblen*( ), *mbstowcs*( ), *mbtowc*( ), *setlocale*( ), *toascii*( ), *tolower*( ), *_tolower*( ), *toupper*( ), *_toupper*( ), *wcstombs*( ), *wctomb*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are now marked.

NAME

dirent.h — format of directory entries

SYNOPSIS

```
#include <dirent.h>
```

DESCRIPTION

The internal format of directories is unspecified.

The **<dirent.h>** header shall define the following type:

DIR A type representing a directory stream.

It shall also define the structure **dirent** which shall include the following members:

XSI
```
ino_t   d_ino         File serial number.
char    d_name[]      Name of entry.
```

XSI The type **ino_t** shall be defined as described in **<sys/types.h>**.

The character array *d_name* is of unspecified size, but the number of bytes preceding the terminating null byte shall not exceed {NAME_MAX}.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided. |

```
int            closedir(DIR *);
DIR           *opendir(const char *);
struct dirent *readdir(DIR *);
int            readdir_r(DIR *restrict, struct dirent *restrict,
                   struct dirent **restrict);
void           rewinddir(DIR *);
void           seekdir(DIR *, long);
long           telldir(DIR *);
```

TSF (readdir_r); XSI (seekdir, telldir)

APPLICATION USAGE

None.

RATIONALE

Information similar to that in the **<dirent.h>** header is contained in a file **<sys/dir.h>** in 4.2 BSD and 4.3 BSD. The equivalent in these implementations of **struct dirent** from this volume of IEEE Std 1003.1-200x is **struct direct**. The filename was changed because the name **<sys/dir.h>** was also used in earlier implementations to refer to definitions related to the older access method; this produced name conflicts. The name of the structure was changed because this volume of IEEE Std 1003.1-200x does not completely define what is in the structure, so it could be different on some implementations from **struct direct**.

The name of an array of **char** of an unspecified size should not be used as an lvalue. Use of: |

```
sizeof(d_name)
```

is incorrect; use:

```
strlen(d_name)
```

instead.

The array of **char** *d_name* is not a fixed size. Implementations may need to declare **struct dirent** with an array size for *d_name* of 1, but the actual number of characters provided matches (or only slightly exceeds) the length of the filename.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *closedir*( ), *opendir*( ), *readdir*( ), *readdir_r*( ), *rewinddir*( ), *seekdir*( ), *telldir*( )

CHANGE HISTORY

First released in Issue 2.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir_r*( ).

The **restrict** keyword is added to the prototype for *readdir_r*( ).

NAME

dlfcn.h — dynamic linking

SYNOPSIS

XSI
```
#include <dlfcn.h>
```

DESCRIPTION

The **<dlfcn.h>** header shall define at least the following macros for use in the construction of a *dlopen*( ) *mode* argument:

RTLD_LAZY	Relocations are performed at an implementation-defined time.
RTLD_NOW	Relocations are performed when the object is loaded.
RTLD_GLOBAL	All symbols are available for relocation processing of other modules.
RTLD_LOCAL	All symbols are not made available for relocation processing by other modules.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided. |

```
int    dlclose(void *);
char  *dlerror(void);
void  *dlopen(const char *, int);
void  *dlsym(void *restrict, const char *restrict);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std 1003.1-200x, *dlopen*( ), *dlclose*( ), *dlsym*( ), *dlerror*( )

CHANGE HISTORY

First released in Issue 5.

Issue 6

The **restrict** keyword is added to the prototype for *dlsym*( ).

NAME

errno.h — system error numbers

SYNOPSIS

```
#include <errno.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

CX The ISO C standard only requires the symbols [EDOM], [EILSEQ], and [ERANGE] to be defined.

The **<errno.h>** header shall provide a declaration for *errno* and give positive values for the following symbolic constants. Their values shall be unique except as noted below:

[E2BIG]	Argument list too long.
[EACCES]	Permission denied.
[EADDRINUSE]	Address in use.
[EADDRNOTAVAIL]	Address not available.
[EAFNOSUPPORT]	Address family not supported.
[EAGAIN]	Resource unavailable, try again (may be the same value as [EWOULDBLOCK]).
[EALREADY]	Connection already in progress.
[EBADF]	Bad file descriptor.
[EBADMSG]	Bad message.
[EBUSY]	Device or resource busy.
[ECANCELED]	Operation canceled.
[ECHILD]	No child processes.
[ECONNABORTED]	Connection aborted.
[ECONNREFUSED]	Connection refused.
[ECONNRESET]	Connection reset.
[EDEADLK]	Resource deadlock would occur.
[EDESTADDRREQ]	Destination address required.
[EDOM]	Mathematics argument out of domain of function.
[EDQUOT]	Reserved.
[EEXIST]	File exists.
[EFAULT]	Bad address.
[EFBIG]	File too large.
[EHOSTUNREACH]	Host is unreachable.
[EIDRM]	Identifier removed.
[EILSEQ]	Illegal byte sequence.

	[EINPROGRESS]	Operation in progress.
	[EINTR]	Interrupted function.
	[EINVAL]	Invalid argument.
	[EIO]	I/O error.
	[EISCONN]	Socket is connected.
	[EISDIR]	Is a directory.
	[ELOOP]	Too many levels of symbolic links.
	[EMFILE]	Too many open files.
	[EMLINK]	Too many links.
	[EMSGSIZE]	Message too large.
	[EMULTIHOP]	Reserved.
	[ENAMETOOLONG]	Filename too long.
	[ENETDOWN]	Network is down.
	[ENETUNREACH]	Network unreachable.
	[ENFILE]	Too many files open in system.
	[ENOBUFS]	No buffer space available.
XSR	[ENODATA]	No message is available on the STREAM head read queue.
	[ENODEV]	No such device.
	[ENOENT]	No such file or directory.
	[ENOEXEC]	Executable file format error.
	[ENOLCK]	No locks available.
	[ENOLINK]	Reserved.
	[ENOMEM]	Not enough space.
	[ENOMSG]	No message of the desired type.
	[ENOPROTOOPT]	Protocol not available.
	[ENOSPC]	No space left on device.
XSR	[ENOSR]	No STREAM resources.
XSR	[ENOSTR]	Not a STREAM.
	[ENOSYS]	Function not supported.
	[ENOTCONN]	The socket is not connected.
	[ENOTDIR]	Not a directory.
	[ENOTEMPTY]	Directory not empty.
	[ENOTSOCK]	Not a socket.
	[ENOTSUP]	Not supported.

[ENOTTY]	Inappropriate I/O control operation.
[ENXIO]	No such device or address.
[EOPNOTSUPP]	Operation not supported on socket.
[EOVERFLOW]	Value too large to be stored in data type.
[EPERM]	Operation not permitted.
[EPIPE]	Broken pipe.
[EPROTO]	Protocol error.
[EPROTONOSUPPORT]	Protocol not supported.
[EPROTOTYPE]	Protocol wrong type for socket.
[ERANGE]	Result too large.
[EROFS]	Read-only file system.
[ESPIPE]	Invalid seek.
[ESRCH]	No such process.
[ESTALE]	Reserved.
XSR [ETIME]	Stream *ioctl*( ) timeout.
[ETIMEDOUT]	Connection timed out.
[ETXTBSY]	Text file busy.
[EWOULDBLOCK]	Operation would block (may be the same value as [EAGAIN]).
[EXDEV]	Cross-device link.

APPLICATION USAGE

Additional error numbers may be defined on conforming systems; see the System Interfaces volume of IEEE Std 1003.1-200x.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std 1003.1-200x, Section 2.3, Error Numbers

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Updated for alignment with the POSIX Realtime Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The majority of the error conditions previously marked as extensions are now mandatory, except for the STREAMS-related error conditions.

Values for *errno* are now required to be distinct positive values rather than non-zero values. This change is for alignment with the ISO/IEC 9899:1999 standard.

NAME

fcntl.h — file control options

SYNOPSIS

```
#include <fcntl.h>
```

DESCRIPTION

The **<fcntl.h>** header shall define the following requests and arguments for use by the functions *fcntl*( ) and *open*( ).

Values for *cmd* used by *fcntl*( ) (the following values are unique) are as follows:

F_DUPFD	Duplicate file descriptor.
F_GETFD	Get file descriptor flags.
F_SETFD	Set file descriptor flags.
F_GETFL	Get file status flags and file access modes.
F_SETFL	Set file status flags.
F_GETLK	Get record locking information.
F_SETLK	Set record locking information.
F_SETLKW	Set record locking information; wait if blocked.
F_GETOWN	Get process or process group ID to receive SIGURG signals.
F_SETOWN	Set process or process group ID to receive SIGURG signals.

File descriptor flags used for *fcntl*( ) are as follows:

FD_CLOEXEC	Close the file descriptor upon execution of an *exec* family function.

Values for *l_type* used for record locking with *fcntl*( ) (the following values are unique) are as follows:

F_RDLCK	Shared or read lock.
F_UNLCK	Unlock.
F_WRLCK	Exclusive or write lock.

XSI The values used for *l_whence*, SEEK_SET, SEEK_CUR, and SEEK_END shall be defined as described in **<unistd.h>**.

The following values are file creation flags and are used in the *oflag* value to *open*( ). They shall be bitwise-distinct.

O_CREAT	Create file if it does not exist.
O_EXCL	Exclusive use flag.
O_NOCTTY	Do not assign controlling terminal.
O_TRUNC	Truncate flag.

File status flags used for *open*( ) and *fcntl*( ) are as follows:

	O_APPEND	Set append mode.
SIO	O_DSYNC	Write according to synchronized I/O data integrity completion.
	O_NONBLOCK	Non-blocking mode.

SIO O_RSYNC	Synchronized read I/O operations.
O_SYNC	Write according to synchronized I/O file integrity completion.

Mask for use with file access modes is as follows:

O_ACCMODE	Mask for file access modes.

File access modes used for *open*( ) and *fcntl*( ) are as follows:

O_RDONLY	Open for reading only.
O_RDWR	Open for reading and writing.
O_WRONLY	Open for writing only.

XSI The symbolic names for file modes for use as values of **mode_t** shall be defined as described in **<sys/stat.h>**.

ADV Values for *advice* used by *posix_fadvise*( ) are as follows:

POSIX_FADV_NORMAL
The application has no advice to give on its behavior with respect to the specified data. It is the default characteristic if no advice is given for an open file.

POSIX_FADV_SEQUENTIAL
The application expects to access the specified data sequentially from lower offsets to higher offsets.

POSIX_FADV_RANDOM
The application expects to access the specified data in a random order.

POSIX_FADV_WILLNEED
The application expects to access the specified data in the near future.

POSIX_FADV_DONTNEED
The application expects that it will not access the specified data in the near future.

POSIX_FADV_NOREUSE
The application expects to access the specified data once and then not reuse it thereafter.

The structure **flock** describes a file lock. It shall include the following members:

`short`	`l_type`	Type of lock; F_RDLCK, F_WRLCK, F_UNLCK.
`short`	`l_whence`	Flag for starting offset.
`off_t`	`l_start`	Relative offset in bytes.
`off_t`	`l_len`	Size; if 0 then until EOF.
`pid_t`	`l_pid`	Process ID of the process holding the lock; returned with F_GETLK.

The **mode_t**, **off_t**, and **pid_t** types shall be defined as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int  creat(const char *, mode_t);
int  fcntl(int, int, ...);
int  open(const char *, int, ...);
int  posix_fadvise(int, off_t, size_t, int);
int  posix_fallocate(int, off_t, size_t);
```

ADV

XSI Inclusion of the **<fcntl.h>** header may also make visible all symbols from **<sys/stat.h>** and **<unistd.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/stat.h>, **<sys/types.h>**, **<unistd.h>**, the System Interfaces volume of IEEE Std 1003.1-200x, *creat*( ), *exec*( ), *fcntl*( ), *open*( ), *posix_fadvise*( ), *posix_fallocate*( ), *posix_madvise*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with POSIX Realtime Extension.

Issue 6

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- O_DSYNC and O_RSYNC are marked as part of the Synchronized Input and Output option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The definition of the **mode_t**, **off_t**, and **pid_t** types is mandated.

The F_GETOWN and F_SETOWN values are added for sockets.

The *posix_fadvise*( ), *posix_fallocate*( ), and *posix_madvise*( ) functions are added for alignment with IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #102 is applied moving the prototype for *posix_madvise*( ) to **<sys/mman.h>**. |

NAME

fenv.h — floating-point environment

SYNOPSIS

```
#include <fenv.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The **<fenv.h>** header shall define the following data types through **typedef**:

fenv_t	Represents the entire floating-point environment. The floating-point environment refers collectively to any floating-point status flags and control modes supported by the implementation.
fexcept_t	Represents the floating-point status flags collectively, including any status the implementation associates with the flags. A floating-point status flag is a system variable whose value is set (but never cleared) when a floating-point exception is raised, which occurs as a side effect of exceptional floating-point arithmetic to provide auxiliary information. A floating-point control mode is a system variable whose value may be set by the user to affect the subsequent behavior of floating-point arithmetic.

The **<fenv.h>** header shall define the following constants if and only if the implementation supports the floating-point exception by means of the floating-point functions *fwclearexcept*( ), *fegetexceptflag*( ), *feraiseexcept*( ), *fesetexceptflag*( ), and *fetestexcept*( ). Each expands to an integer constant expression with values such that bitwise-inclusive ORs of all combinations of the constants result in distinct values.

FE_DIVBYZERO
FE_INEXACT
FE_INVALID
FE_OVERFLOW
FE_UNDERFLOW

The **<fenv.h>** header shall define the following constant, which is simply the bitwise-inclusive OR of all floating-point exception constants defined above:

FE_ALL_EXCEPT

The **<fenv.h>** header shall define the following constants if and only if the implementation supports getting and setting the represented rounding direction by means of the *fegetround*( ) and *fesetround*( ) functions. Each expands to an integer constant expression whose values are distinct non-negative vales.

FE_DOWNWARD
FE_TONEAREST
FE_TOWARDZERO
FE_UPWARD

The **<fenv.h>** header shall define the following constant, which represents the default floating-point environment (that is, the one installed at program startup) and has type pointer to const-qualified **fenv_t**. It can be used as an argument to the functions within the **<fenv.h>** header that manage the floating-point environment.

FE_DFL_ENV

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int  feclearexcept(int);
int  fegetexceptflag(fexcept_t *, int);
int  feraiseexcept(int);
int  fesetexceptflag(const fexcept_t *, int);
int  fetestexcept(int);
int  fegetround(void);
int  fesetround(int);
int  fegetenv(fenv_t *);
int  feholdexcept(fenv_t *);
int  fesetenv(const fenv_t *);
int  feupdateenv(const fenv_t *);
```

The FENV_ACCESS pragma provides a means to inform the implementation when an application might access the floating-point environment to test floating-point status flags or run under non-default floating-point control modes. The pragma shall occur either outside external declarations or preceding all explicit declarations and statements inside a compound statement. When outside external declarations, the pragma takes effect from its occurrence until another FENV_ACCESS pragma is encountered, or until the end of the translation unit. When inside a compound statement, the pragma takes effect from its occurrence until another FENV_ACCESS pragma is encountered (including within a nested compound statement), or until the end of the compound statement; at the end of a compound statement the state for the pragma is restored to its condition just before the compound statement. If this pragma is used in any other context, the behavior is undefined. If part of an application tests floating-point status flags, sets floating-point control modes, or runs under non-default mode settings, but was translated with the state for the FENV_ACCESS pragma off, the behavior is undefined. The default state (on or off) for the pragma is implementation-defined. (When execution passes from a part of the application translated with FENV_ACCESS off to a part translated with FENV_ACCESS on, the state of the floating-point status flags is unspecified and the floating-point control modes have their default settings.)

APPLICATION USAGE

This header is designed to support the floating-point exception status flags and directed-rounding control modes required by the IEC 60559: 1989 standard, and other similar floating-point state information. Also it is designed to facilitate code portability among all systems.

Certain application programming conventions support the intended model of use for the floating-point environment:

- A function call does not alter its caller's floating-point control modes, clear its caller's floating-point status flags, nor depend on the state of its caller's floating-point status flags unless the function is so documented.
- A function call is assumed to require default floating-point control modes, unless its documentation promises otherwise.
- A function call is assumed to have the potential for raising floating-point exceptions, unless its documentation promises otherwise.

With these conventions, an application can safely assume default floating-point control modes (or be unaware of them). The responsibilities associated with accessing the floating-point environment fall on the application that does so explicitly.

Even though the rounding direction macros may expand to constants corresponding to the values of FLT_ROUNDS, they are not required to do so.

For example:

```
#include <fenv.h>
void f(double x)
{
    #pragma STDC FENV_ACCESS ON
    void g(double);
    void h(double);
    /* ... */
    g(x + 1);
    h(x + 1);
    /* ... */
}
```

If the function *g*( ) might depend on status flags set as a side effect of the first *x*+1, or if the second *x*+1 might depend on control modes set as a side effect of the call to function *g*( ), then the application shall contain an appropriately placed invocation as follows:

```
#pragma STDC FENV_ACCESS ON
```

RATIONALE

The fexcept_t Type

fexcept_t does not have to be an integer type. Its values must be obtained by a call to *fegetexceptflag*( ), and cannot be created by logical operations from the exception macros. An implementation might simply implement **fexcept_t** as an **int** and use the representations reflected by the exception macros, but is not required to; other representations might contain extra information about the exceptions. **fexcept_t** might be a **struct** with a member for each exception (that might hold the address of the first or last floating-point instruction that caused that exception). The ISO/IEC 9899:1999 standard makes no claims about the internals of an **fexcept_t**, and so the user cannot inspect it.

Exception and Rounding Macros

Macros corresponding to unsupported modes and rounding directions are not defined by the implementation and must not be defined by the application. An application might use **#ifdef** to test for this. |

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

The return types for *feclearexcept*( ), *fegetexcepflag*( ), *feraiseexcept*( ), *fesetexceptflag*( ), *fegetenv*( ), *fesetenv*( ), and *feupdateenv*( ) are changed from **void** to **int** for alignment with the ISO/IEC 9899:1999 standard, Defect Report 202.

NAME

float.h — floating types

SYNOPSIS

```
#include <float.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The characteristics of floating types are defined in terms of a model that describes a representation of floating-point numbers and values that provide information about an implementation's floating-point arithmetic.

The following parameters are used to define the model for each floating-point type:

s	Sign (±1).
b	Base or radix of exponent representation (an integer >1).
e	Exponent (an integer between a minimum $e_{\min}$ and a maximum $e_{\max}$).
p	Precision (the number of base–b digits in the significand).
f_k	Non-negative integers less than b (the significand digits).

A floating-point number x is defined by the following model:

$$x = sb^{e} \sum_{k=1}^{p} f_k\, b^{-k},\ e_{\min} \le e \le e_{\max}$$

In addition to normalized floating-point numbers (f_1>0 if $x \neq 0$), floating types may be able to contain other kinds of floating-point numbers, such as subnormal floating-point numbers ($x \neq 0$, $e = e_{\min}$, $f_1 = 0$) and unnormalized floating-point numbers ($x \neq 0$, $e > e_{\min}$, $f_1 = 0$), and values that are not floating-point numbers, such as infinities and NaNs. A *NaN* is an encoding signifying Not-a-Number. A *quiet NaN* propagates through almost every arithmetic operation without raising a floating-point exception; a *signaling NaN* generally raises a floating-point exception when occurring as an arithmetic operand.

The accuracy of the floating-point operations (`'+'`, `'−'`, `'*'`, `'/'`) and of the library functions in **<math.h>** and **<complex.h>** that return floating-point results is implementation-defined. The implementation may state that the accuracy is unknown.

All integer values in the **<float.h>** header, except FLT_ROUNDS, shall be constant expressions suitable for use in **#if** preprocessing directives; all floating values shall be constant expressions. All except DECIMAL_DIG, FLT_EVAL_METHOD, FLT_RADIX, and FLT_ROUNDS have separate names for all three floating-point types. The floating-point model representation is provided for all values except FLT_EVAL_METHOD and FLT_ROUNDS.

The rounding mode for floating-point addition is characterized by the implementation-defined value of FLT_ROUNDS:

−1	Indeterminable.
0	Toward zero.
1	To nearest.
2	Toward positive infinity.

3 Toward negative infinity.

All other values for FLT_ROUNDS characterize implementation-defined rounding behavior.

The values of operations with floating operands and values subject to the usual arithmetic conversions and of floating constants are evaluated to a format whose range and precision may be greater than required by the type. The use of evaluation formats is characterized by the implementation-defined value of FLT_EVAL_METHOD:

−1 Indeterminable.

0 Evaluate all operations and constants just to the range and precision of the type.

1 Evaluate operations and constants of type **float** and **double** to the range and precision of the **double** type, evaluate **long double** operations and constants to the range and precision of the **long double** type.

2 Evaluate all operations and constants to the range and precision of the **long double** type.

All other negative values for FLT_EVAL_METHOD characterize implementation-defined behavior.

The values given in the following list shall be defined as constant expressions with implementation-defined values that are greater or equal in magnitude (absolute value) to those shown, with the same sign.

- Radix of exponent representation, *b*.

  FLT_RADIX 2

- Number of base-FLT_RADIX digits in the floating-point significand, *p*.

  FLT_MANT_DIG

  DBL_MANT_DIG

  LDBL_MANT_DIG

- Number of decimal digits, *n*, such that any floating-point number in the widest supported floating type with $p_{\max}$ radix *b* digits can be rounded to a floating-point number with *n* decimal digits and back again without change to the value.

$$\begin{cases} p_{\max} \log_{10} b & \textit{if } b \textit{ is a power of } 10 \\ \lceil 1 + p_{\max} \log_{10} b \rceil & \textit{otherwise} \end{cases}$$

  DECIMAL_DIG 10

- Number of decimal digits, *q*, such that any floating-point number with *q* decimal digits can be rounded into a floating-point number with *p* radix *b* digits and back again without change to the *q* decimal digits.

$$\begin{cases} p \log_{10} b & \textit{if } b \textit{ is a power of } 10 \\ \lfloor (p-1) \log_{10} b \rfloor & \textit{otherwise} \end{cases}$$

  FLT_DIG 6

  DBL_DIG 10

LDBL_DIG	10

- Minimum negative integer such that FLT_RADIX raised to that power minus 1 is a normalized floating-point number, $e_{\min}$.

FLT_MIN_EXP	
DBL_MIN_EXP	
LDBL_MIN_EXP	

- Minimum negative integer such that 10 raised to that power is in the range of normalized floating-point numbers.

$$\left\lceil \log_{10} b^{e_{\min}-1} \right\rceil$$

FLT_MIN_10_EXP	–37
DBL_MIN_10_EXP	–37
LDBL_MIN_10_EXP	–37

- Maximum integer such that FLT_RADIX raised to that power minus 1 is a representable finite floating-point number, $e_{\max}$.

FLT_MAX_EXP	
DBL_MAX_EXP	
LDBL_MAX_EXP	

- Maximum integer such that 10 raised to that power is in the range of representable finite floating-point numbers.

$$\left\lfloor \log_{10}((1-b^{-p})\, b^{e_{\max}}) \right\rfloor$$

FLT_MAX_10_EXP	+37
DBL_MAX_10_EXP	+37
LDBL_MAX_10_EXP	+37

The values given in the following list shall be defined as constant expressions with implementation-defined values that are greater than or equal to those shown:

- Maximum representable finite floating-point number.

$$(1-b^{-p})\, b^{e_{\max}}$$

FLT_MAX	1E+37
DBL_MAX	1E+37
LDBL_MAX	1E+37

The values given in the following list shall be defined as constant expressions with implementation-defined (positive) values that are less than or equal to those shown:

- The difference between 1 and the least value greater that 1 that is representable in the given floating-point type, b^{1-p}.

FLT_EPSILON	1E–5
DBL_EPSILON	1E–9

LDBL_EPSILON	1E–9

- Minimum normalized positive floating-point number, $b^{e_{\min}-1}$.

FLT_MIN	1E–37
DBL_MIN	1E–37
LDBL_MIN	1E–37

The description of the operations with floating-point values is updated for alignment with the ISO / IEC 9899: 1999 standard.

NAME

fmtmsg.h — message display structures

SYNOPSIS

XSI `#include <fmtmsg.h>`

DESCRIPTION

The **<fmtmsg.h>** header shall define the following macros, which expand to constant integer expressions:

MM_HARD	Source of the condition is hardware.
MM_SOFT	Source of the condition is software.
MM_FIRM	Source of the condition is firmware.
MM_APPL	Condition detected by application.
MM_UTIL	Condition detected by utility.
MM_OPSYS	Condition detected by operating system.
MM_RECOVER	Recoverable error.
MM_NRECOV	Non-recoverable error.
MM_HALT	Error causing application to halt.
MM_ERROR	Application has encountered a non-fatal fault.
MM_WARNING	Application has detected unusual non-error condition.
MM_INFO	Informative message.
MM_NOSEV	No severity level provided for the message.
MM_PRINT	Display message on standard error.
MM_CONSOLE	Display message on system console.

The table below indicates the null values and identifiers for *fmtmsg*( ) arguments. The **<fmtmsg.h>** header shall define the macros in the **Identifier** column, which expand to constant expressions that expand to expressions of the type indicated in the **Type** column:

Argument	Type	Null-Value	Identifier
label	**char** *	(**char***)0	MM_NULLLBL
severity	**int**	0	MM_NULLSEV
class	**long**	**0L**	MM_NULLMC
text	**char** *	(**char***)0	MM_NULLTXT
action	**char** *	(**char***)0	MM_NULLACT
tag	**char** *	(**char***)0	MM_NULLTAG

The **<fmtmsg.h>** header shall also define the following macros for use as return values for *fmtmsg*( ):

MM_OK	The function succeeded.
MM_NOTOK	The function failed completely.
MM_NOMSG	The function was unable to generate a message on standard error, but otherwise succeeded.

MM_NOCON	The function was unable to generate a console message, but otherwise succeeded.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

```
int fmtmsg(long, const char *, int,
    const char *, const char *, const char *);
```

NAME

fnmatch.h — filename-matching types

SYNOPSIS

```
#include <fnmatch.h>
```

DESCRIPTION

The **<fnmatch.h>** header shall define the following constants:

FNM_NOMATCH	The string does not match the specified pattern.
FNM_PATHNAME	Slash in *string* only matches slash in *pattern*.
FNM_PERIOD	Leading period in *string* must be exactly matched by period in *pattern*.
FNM_NOESCAPE	Disable backslash escaping.
OB XSI FNM_NOSYS	Reserved.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided. |

```
int fnmatch(const char *, const char *, int);
```

APPLICATION USAGE

None.

The System Interfaces volume of IEEE Std 1003.1-200x, *fnmatch*( ), the Shell and Utilities volume of IEEE Std 1003.1-200x

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 6

The constant FNM_NOSYS is marked obsolescent.

NAME

ftw.h — file tree traversal

SYNOPSIS

XSI
```
#include <ftw.h>
```

DESCRIPTION

The **<ftw.h>** header shall define the **FTW** structure that includes at least the following members:

```
int  base
int  level
```

The **<ftw.h>** header shall define macros for use as values of the third argument to the application-supplied function that is passed as the second argument to *ftw*( ) and *nftw*( ):

FTW_F	File.
FTW_D	Directory.
FTW_DNR	Directory without read permission.
FTW_DP	Directory with subdirectories visited.
FTW_NS	Unknown type; *stat*( ) failed.
FTW_SL	Symbolic link.
FTW_SLN	Symbolic link that names a nonexistent file.

The **<ftw.h>** header shall define macros for use as values of the fourth argument to *nftw*( ):

FTW_PHYS	Physical walk, does not follow symbolic links. Otherwise, *nftw*( ) follows links but does not walk down any path that crosses itself.
FTW_MOUNT	The walk does not cross a mount point.
FTW_DEPTH	All subdirectories are visited before the directory itself.
FTW_CHDIR	The walk changes to each directory before reading it.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int ftw(const char *,
    int (*)(const char *, const struct stat *, int), int);
int nftw(const char *, int (*)
    (const char *, const struct stat *, int, struct FTW*),
    int, int);
```

The **<ftw.h>** header shall define the **stat** structure and the symbolic names for *st_mode* and the file type test macros as described in **<sys/stat.h>**.

Inclusion of the **<ftw.h>** header may also make visible all symbols from **<sys/stat.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A description of FTW_DP is added.

<glob.h>

NAME

glob.h — pathname pattern-matching types

SYNOPSIS

```
#include <glob.h>
```

DESCRIPTION

The **<glob.h>** header shall define the structures and symbolic constants used by the *glob*( ) function.

The structure type **glob_t** shall contain at least the following members:

`size_t`	`gl_pathc`	Count of paths matched by *pattern*.
`char`	`**gl_pathv`	Pointer to a list of matched pathnames.
`size_t`	`gl_offs`	Slots to reserve at the beginning of *gl_pathv*.

The following constants shall be provided as values for the *flags* argument:

GLOB_APPEND	Append generated pathnames to those previously obtained.
GLOB_DOOFFS	Specify how many null pointers to add to the beginning of *pglob->gl_pathv*.
GLOB_ERR	Cause *glob*( ) to return on error.
GLOB_MARK	Each pathname that is a directory that matches *pattern* has a slash appended.
GLOB_NOCHECK	If *pattern* does not match any pathname, then return a list consisting of only *pattern*.
GLOB_NOESCAPE	Disable backslash escaping.
GLOB_NOSORT	Do not sort the pathnames returned.

The following constants shall be defined as error return values:

GLOB_ABORTED	The scan was stopped because GLOB_ERR was set or (**errfunc*)( ) returned non-zero.
GLOB_NOMATCH	The pattern does not match any existing pathname, and GLOB_NOCHECK was not set in flags.
GLOB_NOSPACE	An attempt to allocate memory failed.
OB XSI GLOB_NOSYS	Reserved.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int  glob(const char *restrict, int, int (*restrict)(const char *, int),
          glob_t *restrict);
void globfree (glob_t *);
```

The implementation may define additional macros or constants using names beginning with GLOB_.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 6

The **restrict** keyword is added to the prototype for *glob*( ).

The constant GLOB_NOSYS is marked obsolescent.

NAME

grp.h — group structure

SYNOPSIS

```
#include <grp.h>
```

DESCRIPTION

The **<grp.h>** header shall declare the structure **group** which shall include the following members:

`char`	`*gr_name`	The name of the group.
`gid_t`	`gr_gid`	Numerical group ID.
`char`	`**gr_mem`	Pointer to a null-terminated array of character pointers to member names.

The **gid_t** type shall be defined as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
struct group  *getgrgid(gid_t);
struct group  *getgrnam(const char *);
```

TSF

```
int            getgrgid_r(gid_t, struct group *, char *,
                   size_t, struct group **);
int            getgrnam_r(const char *, struct group *, char *,
                   size_t , struct group **);
```

XSI

```
struct group  *getgrent(void);
void           endgrent(void);
void           setgrent(void);
```

APPLICATION USAGE

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *endgrent*( ), *getgrgid*( ), *getgrnam*( )

CHANGE HISTORY

First released in Issue 1.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The definition of **gid_t** is mandated.
- The *getgrgid_r*( ) and *getgrnam_r*( ) functions are marked as part of the Thread-Safe Functions option.

NAME

iconv.h — codeset conversion facility

SYNOPSIS

XSI
```
#include <iconv.h>
```

DESCRIPTION

The **<iconv.h>** header shall define the following type:

iconv_t	Identifies the conversion from one codeset to another.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided. |

```
iconv_t iconv_open(const char *, const char *);
size_t  iconv(iconv_t, char **restrict, size_t *restrict, char **restrict,
            size_t *restrict);
int     iconv_close(iconv_t);
```

The **restrict** keyword is added to the prototype for *iconv*( ).

NAME

inttypes.h — fixed size integer types

SYNOPSIS

```
#include <inttypes.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of these symbols in this header.

The **<inttypes.h>** header shall include the **<stdint.h>** header.

The **<inttypes.h>** header shall include a definition of at least the following type:

imaxdiv_t Structure type that is the type of the value returned by the *imaxdiv*( ) function.

The following macros shall be defined. Each expands to a character string literal containing a conversion specifier, possibly modified by a length modifier, suitable for use within the *format* argument of a formatted input/output function when converting the corresponding integer type. These macros have the general form of PRI (character string literals for the *fprintf*( ) and *fwprintf*( ) family of functions) or SCN (character string literals for the *fscanf*( ) and *fwscanf*( ) family of functions), followed by the conversion specifier, followed by a name corresponding to a similar type name in **<stdint.h>**. In these names, *N* represents the width of the type as described in **<stdint.h>**. For example, *PRIdFAST32* can be used in a format string to print the value of an integer of type **int_fast32_t**.

The *fprintf*( ) macros for signed integers are:

PRId*N*	PRIdLEAST*N*	PRIdFAST*N*	PRIdMAX	PRIdPTR
PRIi*N*	PRIiLEAST*N*	PRIiFAST*N*	PRIiMAX	PRIiPTR

The *fprintf*( ) macros for unsigned integers are:

PRIo*N*	PRIoLEAST*N*	PRIoFAST*N*	PRIoMAX	PRIoPTR
PRIu*N*	PRIuLEAST*N*	PRIuFAST*N*	PRIuMAX	PRIuPTR
PRIx*N*	PRIxLEAST*N*	PRIxFAST*N*	PRIxMAX	PRIxPTR
PRIX*N*	PRIXLEAST*N*	PRIXFAST*N*	PRIXMAX	PRIXPTR

The *fscanf*( ) macros for signed integers are:

SCNd*N*	SCNdLEAST*N*	SCNdFAST*N*	SCNdMAX	SCNdPTR
SCNi*N*	SCNiLEAST*N*	SCNiFAST*N*	SCNiMAX	SCNiPTR

The *fscanf*( ) macros for unsigned integers are:

SCNo*N*	SCNoLEAST*N*	SCNoFAST*N*	SCNoMAX	SCNoPTR
SCNu*N*	SCNuLEAST*N*	SCNuFAST*N*	SCNuMAX	SCNuPTR
SCNx*N*	SCNxLEAST*N*	SCNxFAST*N*	SCNxMAX	SCNxPTR

For each type that the implementation provides in **<stdint.h>**, the corresponding *fprintf*( ) macros shall be defined and the corresponding *fscanf*( ) macros shall be defined unless the implementation does not have a suitable fscanf length modifier for the type.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
intmax_t  imaxabs(intmax_t);
imaxdiv_t imaxdiv(intmax_t, intmax_t);
intmax_t  strtoimax(const char *restrict, char **restrict, int);
```

```
uintmax_t strtoumax(const char *restrict, char **restrict, int);
intmax_t  wcstoimax(const wchar_t *restrict, wchar_t **restrict, int);
uintmax_t wcstoumax(const wchar_t *restrict, wchar_t **restrict, int);
```

EXAMPLES

```
#include <inttypes.h>
#include <wchar.h>
int main(void)
{
    uintmax_t i = UINTMAX_MAX; // This type always exists.
    wprintf(L"The largest integer value is %020"
        PRIxMAX "\n", i);
    return 0;
}
```

APPLICATION USAGE

None.

RATIONALE

The ISO/IEC 9899:1990 standard specifies that the language should support four signed and unsigned integer data types—**char**, **short**, **int**, and **long**—but places very little requirement on their size other than that **int** and **short** be at least 16 bits and **long** be at least as long as **int** and not smaller than 32 bits. For 16-bit systems, most implementations assign 8, 16, 16, and 32 bits to **char**, **short**, **int**, and **long**, respectively. For 32-bit systems, the common practice is to assign 8, 16, 32, and 32 bits to these types. This difference in **int** size can create some problems for users who migrate from one system to another which assigns different sizes to integer types, because the ISO C standard integer promotion rule can produce silent changes unexpectedly. The need for defining an extended integer type increased with the introduction of 64-bit systems.

The purpose of **<inttypes.h>** is to provide a set of integer types whose definitions are consistent across machines and independent of operating systems and other implementation idiosyncrasies. It defines, via **typedef**, integer types of various sizes. Implementations are free to **typedef** them as ISO C standard integer types or extensions that they support. Consistent use of this header will greatly increase the portability of a users program across platforms.

FUTURE DIRECTIONS

Macro names beginning with PRI or SCN followed by any lowercase letter or `'X'` may be added to the macros defined in the **<inttypes.h>** header.

CHANGE HISTORY

First released in Issue 5.

Issue 6

The Open Group Base Resolution bwg97-006 is applied.

This reference page is updated to align with the ISO/IEC 9899:1999 standard.

NAME

iso646.h — alternative spellings

SYNOPSIS

```
#include <iso646.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The **<iso646.h>** header shall define the following eleven macros (on the left) that expand to the corresponding tokens (on the right):

and	&&
and_eq	&=
bitand	&
bitor	|
compl	~
not	!
not_eq	!=
or	||
or_eq	|=
xor	^
xor_eq	^=

APPLICATION USAGE

None.

First released in Issue 5. Derived from ISO/IEC 9899: 1990/Amendment 1: 1995 (E).

NAME

langinfo.h — language information constants

SYNOPSIS

XSI
```
#include <langinfo.h>
```

DESCRIPTION

The **<langinfo.h>** header contains the constants used to identify items of *langinfo* data (see *nl_langinfo*( )). The type of the constant, **nl_item**, shall be defined as described in **<nl_types.h>**.

The following constants shall be defined. The entries under **Category** indicate in which *setlocale*( ) category each item is defined.

Constant	Category	Meaning
CODESET	*LC_CTYPE*	Codeset name.
D_T_FMT	*LC_TIME*	String for formatting date and time.
D_FMT	*LC_TIME*	Date format string.
T_FMT	*LC_TIME*	Time format string.
T_FMT_AMPM	*LC_TIME*	a.m. or p.m. time format string.
AM_STR	*LC_TIME*	Ante Meridian affix.
PM_STR	*LC_TIME*	Post Meridian affix.
DAY_1	*LC_TIME*	Name of the first day of the week (for example, Sunday).
DAY_2	*LC_TIME*	Name of the second day of the week (for example, Monday).
DAY_3	*LC_TIME*	Name of the third day of the week (for example, Tuesday).
DAY_4	*LC_TIME*	Name of the fourth day of the week (for example, Wednesday).
DAY_5	*LC_TIME*	Name of the fifth day of the week (for example, Thursday).
DAY_6	*LC_TIME*	Name of the sixth day of the week (for example, Friday).
DAY_7	*LC_TIME*	Name of the seventh day of the week (for example, Saturday).
ABDAY_1	*LC_TIME*	Abbreviated name of the first day of the week.
ABDAY_2	*LC_TIME*	Abbreviated name of the second day of the week.
ABDAY_3	*LC_TIME*	Abbreviated name of the third day of the week.
ABDAY_4	*LC_TIME*	Abbreviated name of the fourth day of the week.
ABDAY_5	*LC_TIME*	Abbreviated name of the fifth day of the week.
ABDAY_6	*LC_TIME*	Abbreviated name of the sixth day of the week.
ABDAY_7	*LC_TIME*	Abbreviated name of the seventh day of the week.
MON_1	*LC_TIME*	Name of the first month of the year.
MON_2	*LC_TIME*	Name of the second month.
MON_3	*LC_TIME*	Name of the third month.
MON_4	*LC_TIME*	Name of the fourth month.
MON_5	*LC_TIME*	Name of the fifth month.
MON_6	*LC_TIME*	Name of the sixth month.
MON_7	*LC_TIME*	Name of the seventh month.
MON_8	*LC_TIME*	Name of the eighth month.
MON_9	*LC_TIME*	Name of the ninth month.
MON_10	*LC_TIME*	Name of the tenth month.
MON_11	*LC_TIME*	Name of the eleventh month.
MON_12	*LC_TIME*	Name of the twelfth month.

Constant	Category	Meaning
ABMON_1	*LC_TIME*	Abbreviated name of the first month.
ABMON_2	*LC_TIME*	Abbreviated name of the second month.
ABMON_3	*LC_TIME*	Abbreviated name of the third month.
ABMON_4	*LC_TIME*	Abbreviated name of the fourth month.
ABMON_5	*LC_TIME*	Abbreviated name of the fifth month.
ABMON_6	*LC_TIME*	Abbreviated name of the sixth month.
ABMON_7	*LC_TIME*	Abbreviated name of the seventh month.
ABMON_8	*LC_TIME*	Abbreviated name of the eighth month.
ABMON_9	*LC_TIME*	Abbreviated name of the ninth month.
ABMON_10	*LC_TIME*	Abbreviated name of the tenth month.
ABMON_11	*LC_TIME*	Abbreviated name of the eleventh month.
ABMON_12	*LC_TIME*	Abbreviated name of the twelfth month.
ERA	*LC_TIME*	Era description segments.
ERA_D_FMT	*LC_TIME*	Era date format string.
ERA_D_T_FMT	*LC_TIME*	Era date and time format string.
ERA_T_FMT	*LC_TIME*	Era time format string.
ALT_DIGITS	*LC_TIME*	Alternative symbols for digits.
RADIXCHAR	*LC_NUMERIC*	Radix character.
THOUSEP	*LC_NUMERIC*	Separator for thousands.
YESEXPR	*LC_MESSAGES*	Affirmative response expression.
NOEXPR	*LC_MESSAGES*	Negative response expression.
CRNCYSTR	*LC_MONETARY*	Currency symbol, preceded by '−' if the symbol should appear before the value, '+' if the symbol should appear after the value, or '.' if the symbol should replace the radix character.

If the locale's values for **p_cs_precedes** and **n_cs_precedes** do not match, the value of *nl_langinfo*(CRNCYSTR) is unspecified. |

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided. |

```
char *nl_langinfo(nl_item);
```

Inclusion of the **<langinfo.h>** header may also make visible all symbols from **<nl_types.h>**.

APPLICATION USAGE

Wherever possible, users are advised to use functions compatible with those in the ISO C standard to access items of *langinfo* data. In particular, the *strftime*( ) function should be used to access date and time information defined in category *LC_TIME*. The *localeconv*( ) function should be used to access information corresponding to RADIXCHAR, THOUSEP, and CRNCYSTR.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 5

The constants YESSTR and NOSTR are marked LEGACY.

Issue 6

The constants YESSTR and NOSTR are removed.

NAME

libgen.h — definitions for pattern matching functions

SYNOPSIS

XSI

```
#include <libgen.h>
```

DESCRIPTION

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
char  *basename(char *);
char  *dirname(char *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std 1003.1-200x, *basename*( ), *dirname*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

The function prototypes for *basename*( ) and *dirname*( ) are changed to indicate that the first argument is of type **char *** rather than **const char ***.

Issue 6

The **__loc1** symbol and the *regcmp*( ) and *regex*( ) functions are removed.

NAME

limits.h — implementation-defined constants

SYNOPSIS

```
#include <limits.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of these symbols in this header.

CX Many of the symbols listed here are not defined by the ISO/IEC 9899:1999 standard. Such symbols are not shown as CX shaded.

The **<limits.h>** header shall define various symbolic names. Different categories of names are described below.

The names represent various limits on resources that the implementation imposes on applications.

Implementations may choose any appropriate value for each limit, provided it is not more restrictive than the Minimum Acceptable Values listed below. Symbolic constant names beginning with _POSIX may be found in **<unistd.h>**.

Applications should not assume any particular value for a limit. To achieve maximum portability, an application should not require more resource than the Minimum Acceptable Value quantity. However, an application wishing to avail itself of the full amount of a resource available on an implementation may make use of the value given in **<limits.h>** on that particular implementation, by using the symbolic names listed below. It should be noted, however, that many of the listed limits are not invariant, and at runtime, the value of the limit may differ from those given in this header, for the following reasons:

- The limit is pathname-dependent. |
- The limit differs between the compile and runtime machines.

For these reasons, an application may use the *fpathconf*( ), *pathconf*( ), and *sysconf*( ) functions to determine the actual value of a limit at runtime.

The items in the list ending in _MIN give the most negative values that the mathematical types are guaranteed to be capable of representing. Numbers of a more negative value may be supported on some implementations, as indicated by the **<limits.h>** header on the implementation, but applications requiring such numbers are not guaranteed to be portable to all implementations. For positive constants ending in _MIN, this indicates the minimum acceptable value.

The Minimum Acceptable Value symbol '*' indicates that there is no guaranteed value across all conforming implementations.

Runtime Invariant Values (Possibly Indeterminate)

A definition of one of the symbolic names in the following list shall be omitted from **<limits.h>** on specific implementations where the corresponding value is equal to or greater than the stated minimum, but is unspecified.

This indetermination might depend on the amount of available memory space on a specific instance of a specific implementation. The actual value supported by a specific instance shall be provided by the *sysconf*( ) function.

AIO {AIO_LISTIO_MAX}
Maximum number of I/O operations in a single list I/O call supported by the implementation.
Minimum Acceptable Value: {_POSIX_AIO_LISTIO_MAX}

AIO {AIO_MAX}
Maximum number of outstanding asynchronous I/O operations supported by the implementation.
Minimum Acceptable Value: {_POSIX_AIO_MAX}

AIO {AIO_PRIO_DELTA_MAX}
The maximum amount by which a process can decrease its asynchronous I/O priority level from its own scheduling priority.
Minimum Acceptable Value: 0

{ARG_MAX}
Maximum length of argument to the *exec* functions including environment data.
Minimum Acceptable Value: {_POSIX_ARG_MAX}

XSI {ATEXIT_MAX}
Maximum number of functions that may be registered with *atexit*( ).
Minimum Acceptable Value: 32

{CHILD_MAX}
Maximum number of simultaneous processes per real user ID.
Minimum Acceptable Value: {_POSIX_CHILD_MAX}

TMR {DELAYTIMER_MAX}
Maximum number of timer expiration overruns.
Minimum Acceptable Value: {_POSIX_DELAYTIMER_MAX}

{HOST_NAME_MAX}
Maximum length of a host name (not including the terminating null) as returned from the *gethostname*( ) function.
Minimum Acceptable Value: {_POSIX_HOST_NAME_MAX}

XSI {IOV_MAX}
Maximum number of **iovec** structures that one process has available for use with *readv*( ) or *writev*( ).
Minimum Acceptable Value: {_XOPEN_IOV_MAX}

{LOGIN_NAME_MAX}
Maximum length of a login name.
Minimum Acceptable Value: {_POSIX_LOGIN_NAME_MAX}

MSG {MQ_OPEN_MAX}
The maximum number of open message queue descriptors a process may hold.
Minimum Acceptable Value: {_POSIX_MQ_OPEN_MAX}

MSG {MQ_PRIO_MAX}
The maximum number of message priorities supported by the implementation.
Minimum Acceptable Value: {_POSIX_MQ_PRIO_MAX}

{OPEN_MAX}
Maximum number of files that one process can have open at any one time.
Minimum Acceptable Value: {_POSIX_OPEN_MAX}

{PAGESIZE}
Size in bytes of a page.
Minimum Acceptable Value: 1

XSI {PAGE_SIZE}
Equivalent to {PAGESIZE}. If either {PAGESIZE} or {PAGE_SIZE} is defined, the other is defined with the same value.

THR {PTHREAD_DESTRUCTOR_ITERATIONS}
Maximum number of attempts made to destroy a thread's thread-specific data values on thread exit.
Minimum Acceptable Value: {_POSIX_THREAD_DESTRUCTOR_ITERATIONS}

THR {PTHREAD_KEYS_MAX}
Maximum number of data keys that can be created by a process.
Minimum Acceptable Value: {_POSIX_THREAD_KEYS_MAX}

THR {PTHREAD_STACK_MIN}
Minimum size in bytes of thread stack storage.
Minimum Acceptable Value: 0

THR {PTHREAD_THREADS_MAX}
Maximum number of threads that can be created per process.
Minimum Acceptable Value: {_POSIX_THREAD_THREADS_MAX}

{RE_DUP_MAX}
The number of repeated occurrences of a BRE permitted by the *regexec*( ) and *regcomp*( ) functions when using the interval notation {\(*m*,*n*\}; see Section 9.3.6 (on page 170).
Minimum Acceptable Value: {_POSIX2_RE_DUP_MAX}

RTS {RTSIG_MAX}
Maximum number of realtime signals reserved for application use in this implementation.
Minimum Acceptable Value: {_POSIX_RTSIG_MAX}

SEM {SEM_NSEMS_MAX}
Maximum number of semaphores that a process may have.
Minimum Acceptable Value: {_POSIX_SEM_NSEMS_MAX}

SEM {SEM_VALUE_MAX}
The maximum value a semaphore may have.
Minimum Acceptable Value: {_POSIX_SEM_VALUE_MAX}

RTS {SIGQUEUE_MAX}
Maximum number of queued signals that a process may send and have pending at the receiver(s) at any time.
Minimum Acceptable Value: {_POSIX_SIGQUEUE_MAX}

SS|TSP {SS_REPL_MAX}
The maximum number of replenishment operations that may be simultaneously pending for a particular sporadic server scheduler.
Minimum Acceptable Value: {_POSIX_SS_REPL_MAX}

{STREAM_MAX}

The number of streams that one process can have open at one time. If defined, it has the same value as {FOPEN_MAX} (see **<stdio.h>**).
Minimum Acceptable Value: {_POSIX_STREAM_MAX}

{SYMLOOP_MAX}

Maximum number of symbolic links that can be reliably traversed in the resolution of a pathname in the absence of a loop.
Minimum Acceptable Value: {_POSIX_SYMLOOP_MAX}

TMR {TIMER_MAX}

Maximum number of timers per-process supported by the implementation.
Minimum Acceptable Value: {_POSIX_TIMER_MAX}

TRC {TRACE_EVENT_NAME_MAX}

Maximum length of the trace event name.
Minimum Acceptable Value: {_POSIX_TRACE_EVENT_NAME_MAX}

TRC {TRACE_NAME_MAX}

Maximum length of the trace generation version string or of the trace stream name.
Minimum Acceptable Value: {_POSIX_TRACE_NAME_MAX}

TRC {TRACE_SYS_MAX}

Maximum number of trace streams that may simultaneously exist in the system.
Minimum Acceptable Value: {_POSIX_TRACE_SYS_MAX}

TRC {TRACE_USER_EVENT_MAX}

Maximum number of user trace event type identifiers that may simultaneously exist in a traced process, including the predefined user trace event POSIX_TRACE_UNNAMED_USER_EVENT.
Minimum Acceptable Value: {_POSIX_TRACE_USER_EVENT_MAX}

{TTY_NAME_MAX}

Maximum length of terminal device name.
Minimum Acceptable Value: {_POSIX_TTY_NAME_MAX}

{TZNAME_MAX}

Maximum number of bytes supported for the name of a timezone (not of the TZ variable).
Minimum Acceptable Value: {_POSIX_TZNAME_MAX}

Note: The length given by {TZNAME_MAX} does not include the quoting characters mentioned in Section 8.3 (on page 161).

Pathname Variable Values

The values in the following list may be constants within an implementation or may vary from one pathname to another. For example, file systems or directories may have different characteristics.

A definition of one of the values shall be omitted from the **<limits.h>** header on specific implementations where the corresponding value is equal to or greater than the stated minimum, but where the value can vary depending on the file to which it is applied. The actual value supported for a specific pathname shall be provided by the *pathconf*( ) function.

{FILESIZEBITS}

Minimum number of bits needed to represent, as a signed integer value, the maximum size of a regular file allowed in the specified directory.
Minimum Acceptable Value: 32

{LINK_MAX}
Maximum number of links to a single file.
Minimum Acceptable Value: {_POSIX_LINK_MAX}

{MAX_CANON}
Maximum number of bytes in a terminal canonical input line.
Minimum Acceptable Value: {_POSIX_MAX_CANON}

{MAX_INPUT}
Minimum number of bytes for which space is available in a terminal input queue; therefore, the maximum number of bytes a conforming application may require to be typed as input before reading them.
Minimum Acceptable Value: {_POSIX_MAX_INPUT}

{NAME_MAX}
Maximum number of bytes in a filename (not including terminating null).
Minimum Acceptable Value: {_POSIX_NAME_MAX}
XSI Minimum Acceptable Value: {_XOPEN_NAME_MAX}

{PATH_MAX}
Maximum number of bytes in a pathname, including the terminating null character.
Minimum Acceptable Value: {_POSIX_PATH_MAX}
XSI Minimum Acceptable Value: {_XOPEN_PATH_MAX}

{PIPE_BUF}
Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
Minimum Acceptable Value: {_POSIX_PIPE_BUF}

ADV {POSIX_ALLOC_SIZE_MIN}
Minimum number of bytes of storage actually allocated for any portion of a file.
Minimum Acceptable Value: Not specified.

ADV {POSIX_REC_INCR_XFER_SIZE}
Recommended increment for file transfer sizes between the {POSIX_REC_MIN_XFER_SIZE} and {POSIX_REC_MAX_XFER_SIZE} values.
Minimum Acceptable Value: Not specified.

ADV {POSIX_REC_MAX_XFER_SIZE}
Maximum recommended file transfer size.
Minimum Acceptable Value: Not specified.

ADV {POSIX_REC_MIN_XFER_SIZE}
Minimum recommended file transfer size.
Minimum Acceptable Value: Not specified.

ADV {POSIX_REC_XFER_ALIGN}
Recommended file transfer buffer alignment.
Minimum Acceptable Value: Not specified.

{SYMLINK_MAX}
Maximum number of bytes in a symbolic link.
Minimum Acceptable Value: {_POSIX_SYMLINK_MAX}

Runtime Increasable Values

The magnitude limitations in the following list shall be fixed by specific implementations. An application should assume that the value supplied by **<limits.h>** in a specific implementation is the minimum that pertains whenever the application is run under that implementation. A specific instance of a specific implementation may increase the value relative to that supplied by **<limits.h>** for that implementation. The actual value supported by a specific instance shall be provided by the *sysconf*( ) function.

{BC_BASE_MAX}
Maximum *obase* values allowed by the *bc* utility.
Minimum Acceptable Value: {_POSIX2_BC_BASE_MAX}

{BC_DIM_MAX}
Maximum number of elements permitted in an array by the *bc* utility.
Minimum Acceptable Value: {_POSIX2_BC_DIM_MAX}

{BC_SCALE_MAX}
Maximum *scale* value allowed by the *bc* utility.
Minimum Acceptable Value: {_POSIX2_BC_SCALE_MAX}

{BC_STRING_MAX}
Maximum length of a string constant accepted by the *bc* utility.
Minimum Acceptable Value: {_POSIX2_BC_STRING_MAX}

{CHARCLASS_NAME_MAX}
Maximum number of bytes in a character class name.
Minimum Acceptable Value: {_POSIX2_CHARCLASS_NAME_MAX}

{COLL_WEIGHTS_MAX}
Maximum number of weights that can be assigned to an entry of the *LC_COLLATE* **order** keyword in the locale definition file; see Chapter 7 (on page 119).
Minimum Acceptable Value: {_POSIX2_COLL_WEIGHTS_MAX}

{EXPR_NEST_MAX}
Maximum number of expressions that can be nested within parentheses by the *expr* utility.
Minimum Acceptable Value: {_POSIX2_EXPR_NEST_MAX}

{LINE_MAX}
Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing newline.
Minimum Acceptable Value: {_POSIX2_LINE_MAX}

{NGROUPS_MAX}
Maximum number of simultaneous supplementary group IDs per process.
Minimum Acceptable Value: {_POSIX_NGROUPS_MAX}

{RE_DUP_MAX}
Maximum number of repeated occurrences of a regular expression permitted when using the interval notation \{*m*,*n*\}; see Chapter 9 (on page 165).
Minimum Acceptable Value: {_POSIX2_RE_DUP_MAX}

Maximum Values

TMR The symbolic constants in the following list shall be defined in **<limits.h>** with the values shown. These are symbolic names for the most restrictive value for certain features on an implementation supporting the Timers option. A conforming implementation shall provide values no larger than these values. A conforming application must not require a smaller value for correct operation.

TMR {_POSIX_CLOCKRES_MIN}
The resolution of the CLOCK_REALTIME clock, in nanoseconds.
Value: 20 000 000

MON If the Monotonic Clock option is supported, the resolution of the CLOCK_MONOTONIC clock, in nanoseconds, is represented by {_POSIX_CLOCKRES_MIN}.

Minimum Values

The symbolic constants in the following list shall be defined in **<limits.h>** with the values shown. These are symbolic names for the most restrictive value for certain features on an implementation conforming to this volume of IEEE Std 1003.1-200x. Related symbolic constants are defined elsewhere in this volume of IEEE Std 1003.1-200x which reflect the actual implementation and which need not be as restrictive. A conforming implementation shall provide values at least this large. A strictly conforming application must not require a larger value for correct operation.

AIO {_POSIX_AIO_LISTIO_MAX}
The number of I/O operations that can be specified in a list I/O call.
Value: 2

AIO {_POSIX_AIO_MAX}
The number of outstanding asynchronous I/O operations.
Value: 1

{_POSIX_ARG_MAX}
Maximum length of argument to the *exec* functions including environment data.
Value: 4 096

{_POSIX_CHILD_MAX}
Maximum number of simultaneous processes per real user ID.
Value: 6

TMR {_POSIX_DELAYTIMER_MAX}
The number of timer expiration overruns.
Value: 32

{_POSIX_HOST_NAME_MAX}
Maximum length of a host name (not including the terminating null) as returned from the *gethostname*( ) function.
Value: 255

{_POSIX_LINK_MAX}
Maximum number of links to a single file.
Value: 8

{_POSIX_LOGIN_NAME_MAX}
The size of the storage required for a login name, in bytes, including the terminating null.
Value: 9

{_POSIX_MAX_CANON}
Maximum number of bytes in a terminal canonical input queue.
Value: 255

{_POSIX_MAX_INPUT}
Maximum number of bytes allowed in a terminal input queue.
Value: 255

MSG {_POSIX_MQ_OPEN_MAX}
The number of message queues that can be open for a single process.
Value: 8

MSG {_POSIX_MQ_PRIO_MAX}
The maximum number of message priorities supported by the implementation.
Value: 32

{_POSIX_NAME_MAX}
Maximum number of bytes in a filename (not including terminating null).
Value: 14

{_POSIX_NGROUPS_MAX}
Maximum number of simultaneous supplementary group IDs per process.
Value: 8

{_POSIX_OPEN_MAX}
Maximum number of files that one process can have open at any one time.
Value: 20

{_POSIX_PATH_MAX}
Maximum number of bytes in a pathname.
Value: 256

{_POSIX_PIPE_BUF}
Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
Value: 512

{_POSIX_RE_DUP_MAX}
The number of repeated occurrences of a BRE permitted by the *regexec*() and *regcomp*() functions when using the interval notation {\(*m*,*n*\}; see Section 9.3.6 (on page 170).
Value: 255

RTS {_POSIX_RTSIG_MAX}
The number of realtime signal numbers reserved for application use.
Value: 8

SEM {_POSIX_SEM_NSEMS_MAX}
The number of semaphores that a process may have.
Value: 256

SEM {_POSIX_SEM_VALUE_MAX}
The maximum value a semaphore may have.
Value: 32 767

RTS {_POSIX_SIGQUEUE_MAX}
The number of queued signals that a process may send and have pending at the receiver(s) at any time.
Value: 32

{_POSIX_SSIZE_MAX}
The value that can be stored in an object of type **ssize_t**.
Value: 32 767

{_POSIX_STREAM_MAX}
The number of streams that one process can have open at one time.
Value: 8

SS|TSP {_POSIX_SS_REPL_MAX}
The number of replenishment operations that may be simultaneously pending for a particular sporadic server scheduler.
Value: 4

{_POSIX_SYMLINK_MAX}
The number of bytes in a symbolic link.
Value: 255

{_POSIX_SYMLOOP_MAX}
The number of symbolic links that can be traversed in the resolution of a pathname in the absence of a loop. |
Value: 8

THR {_POSIX_THREAD_DESTRUCTOR_ITERATIONS}
The number of attempts made to destroy a thread's thread-specific data values on thread exit.
Value: 4

THR {_POSIX_THREAD_KEYS_MAX}
The number of data keys per process.
Value: 128

THR {_POSIX_THREAD_THREADS_MAX}
The number of threads per process.
Value: 64

TMR {_POSIX_TIMER_MAX}
The per process number of timers.
Value: 32

TRC {_POSIX_TRACE_EVENT_NAME_MAX}
The length in bytes of a trace event name.
Value: 30

TRC {_POSIX_TRACE_NAME_MAX}
The length in bytes of a trace generation version string or a trace stream name.
Value: 8

TRC {_POSIX_TRACE_SYS_MAX}
The number of trace streams that may simultaneously exist in the system.
Value: 8

TRC {_POSIX_TRACE_USER_EVENT_MAX}
The number of user trace event type identifiers that may simultaneously exist in a traced process, including the predefined user trace event POSIX_TRACE_UNNAMED_USER_EVENT.
Value: 32

{_POSIX_TTY_NAME_MAX}
The size of the storage required for a terminal device name, in bytes, including the

terminating null.
Value: 9

{_POSIX_TZNAME_MAX}
Maximum number of bytes supported for the name of a timezone (not of the TZ variable).
Value: 6

Note: The length given by {_POSIX_TZNAME_MAX} does not include the quoting characters mentioned in Section 8.3 (on page 161).

{_POSIX2_BC_BASE_MAX}
Maximum *obase* values allowed by the *bc* utility.
Value: 99

{_POSIX2_BC_DIM_MAX}
Maximum number of elements permitted in an array by the *bc* utility.
Value: 2 048

{_POSIX2_BC_SCALE_MAX}
Maximum *scale* value allowed by the *bc* utility.
Value: 99

{_POSIX2_BC_STRING_MAX}
Maximum length of a string constant accepted by the *bc* utility.
Value: 1 000

{_POSIX2_CHARCLASS_NAME_MAX}
Maximum number of bytes in a character class name.
Value: 14

{_POSIX2_COLL_WEIGHTS_MAX}
Maximum number of weights that can be assigned to an entry of the *LC_COLLATE* **order** keyword in the locale definition file; see Chapter 7 (on page 119).
Value: 2

{_POSIX2_EXPR_NEST_MAX}
Maximum number of expressions that can be nested within parentheses by the *expr* utility.
Value: 32

{_POSIX2_LINE_MAX}
Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing newline.
Value: 2 048

{_POSIX2_RE_DUP_MAX]
Maximum number of repeated occurrences of a regular expression permitted when using the interval notation \{*m*,*n*\}; see Chapter 9 (on page 165).
Value: 255

XSI {_XOPEN_IOV_MAX}
Maximum number of **iovec** structures that one process has available for use with *readv*( ) or *writev*( ).
Value: 16

XSI {_XOPEN_NAME_MAX}
Maximum number of bytes in a filename (not including terminating null).
Value: 255

XSI {_XOPEN_PATH_MAX}
Maximum number of bytes in a pathname.
Value: 1 024

Numerical Limits

The values in the following lists shall be defined in **<limits.h>** and are constant expressions suitable for use in **#if** preprocessing directives. Moreover, except for {CHAR_BIT}, XSI {DBL_DIG}, {DBL_MAX}, {FLT_DIG}, {FLT_MAX}, {LONG_BIT}, {WORD_BIT}, and {MB_LEN_MAX}, the symbolic names are defined as expressions of the correct type.

If the value of an object of type **char** is treated as a signed integer when used in an expression, the value of {CHAR_MIN} is the same as that of {SCHAR_MIN} and the value of {CHAR_MAX} is the same as that of {SCHAR_MAX}. Otherwise, the value of {CHAR_MIN} is 0 and the value of {CHAR_MAX} is the same as that of {UCHAR_MAX}.

{CHAR_BIT}
Number of bits in a type **char**.
CX Value: 8

{CHAR_MAX}
Maximum value of type **char**.
Minimum Acceptable Value: {UCHAR_MAX} or {SCHAR_MAX}

{INT_MAX}
Maximum value of an **int**.
Minimum Acceptable Value: 2 147 483 647

XSI {LONG_BIT}
Number of bits in a **long**.
Minimum Acceptable Value: 32

{LONG_MAX}
Maximum value of a **long**.
Minimum Acceptable Value: +2 147 483 647

{MB_LEN_MAX}
Maximum number of bytes in a character, for any supported locale.
Minimum Acceptable Value: 1

{SCHAR_MAX}
Maximum value of type **signed char**.
CX Value: +127

{SHRT_MAX}
Maximum value of type **short**.
Minimum Acceptable Value: +32 767

{SSIZE_MAX}
Maximum value of an object of type **ssize_t**.
Minimum Acceptable Value: {_POSIX_SSIZE_MAX}

{UCHAR_MAX}
Maximum value of type **unsigned char**.
CX Value: 255

{UINT_MAX}
Maximum value of type **unsigned**.
Minimum Acceptable Value: 4 294 967 295

{ULONG_MAX}
Maximum value of type **unsigned long**.
Minimum Acceptable Value: 4 294 967 295

{USHRT_MAX}
Maximum value for a type **unsigned short**.
Minimum Acceptable Value: 65 535

XSI {WORD_BIT}
Number of bits in a word or type **int**.
Minimum Acceptable Value: 16

{CHAR_MIN}
Minimum value of type **char**.
Maximum Acceptable Value: {SCHAR_MIN} or 0

{INT_MIN}
Minimum value of type **int**.
Maximum Acceptable Value: –2 147 483 647

{LONG_MIN}
Minimum value of type **long**.
Maximum Acceptable Value: –2 147 483 647

{SCHAR_MIN}
Minimum value of type **signed char**.
CX Value: –128 |

{SHRT_MIN}
Minimum value of type **short**.
Maximum Acceptable Value: –32 767

{LLONG_MIN}
Minimum value of type **long long**.
Maximum Acceptable Value: –9223372036854775807

{LLONG_MAX}
Maximum value of type **long long**.
Minimum Acceptable Value: +9223372036854775807

{ULLONG_MAX}
Maximum value of type **unsigned long long**.
Minimum Acceptable Value: 18446744073709551615

Other Invariant Values

XSI The following constants shall be defined on all implementations in **<limits.h>**:

XSI {CHARCLASS_NAME_MAX}
Maximum number of bytes in a character class name.
Minimum Acceptable Value: 14

XSI {NL_ARGMAX}
Maximum value of *digit* in calls to the *printf*( ) and *scanf*( ) functions.
Minimum Acceptable Value: 9

XSI {NL_LANGMAX}
Maximum number of bytes in a *LANG* name.
Minimum Acceptable Value: 14

XSI {NL_MSGMAX}
Maximum message number.
Minimum Acceptable Value: 32 767

XSI {NL_NMAX}
Maximum number of bytes in an N-to-1 collation mapping.
Minimum Acceptable Value: '*'

XSI {NL_SETMAX}
Maximum set number.
Minimum Acceptable Value: 255

XSI {NL_TEXTMAX}
Maximum number of bytes in a message string.
Minimum Acceptable Value: {_POSIX2_LINE_MAX}

XSI {NZERO}
Default process priority.
Minimum Acceptable Value: 20

APPLICATION USAGE

None.

RATIONALE

A request was made to reduce the value of {_POSIX_LINK_MAX} from the value of 8 specified for it in the POSIX.1-1990 standard to 2. The standard developers decided to deny this request for several reasons.

- They wanted to avoid making any changes to the standard that could break conforming applications, and the requested change could have that effect.
- The use of multiple hard links to a file cannot always be replaced with use of symbolic links. Symbolic links are semantically different from hard links in that they associate a pathname with another pathname rather than a pathname with a file. This has implications for access control, file permanence, and transparency. |
- The original standard developers had considered the issue of allowing for implementations that did not in general support hard links, and decided that this would reduce consensus on the standard.

Systems that support historical versions of the development option of the ISO POSIX-2 standard retain the name {_POSIX2_RE_DUP_MAX} as an alias for {_POSIX_RE_DUP_MAX}.

{PATH_MAX}
IEEE PASC Interpretation 1003.1 #15 addressed the inconsistency in the standard with the definition of pathname and the description of {PATH_MAX}, allowing application writers to allocate either {PATH_MAX} or {PATH_MAX}+1 bytes. The inconsistency has been removed by correction to the {PATH_MAX} definition to include the null character. With this change, applications that previously allocated {PATH_MAX} bytes will continue to succeed. |

{SYMLINK_MAX}
This symbol refers to space for data that is stored in the file system, as opposed to {PATH_MAX} which is the length of a name that can be passed to a function. In some existing implementations, the filenames pointed to by symbolic links are stored in the inodes of the links, so it is important that {SYMLINK_MAX} not be constrained to be as large as {PATH_MAX}.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std 1003.1-200x, *fpathconf*( ), *pathconf*( ), *sysconf*( )

CHANGE HISTORY

First released in Issue 1.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

{FILESIZEBITS} added for the Large File Summit extensions.

The minimum acceptable values for {INT_MAX}, {INT_MIN}, and {UINT_MAX} are changed to make 32-bit values the minimum requirement.

The entry is restructured to improve readability.

Issue 6

The Open Group Corrigendum U033/4 is applied. The wording is made clear for {CHAR_MIN}, {INT_MIN}, {LONG_MIN}, {SCHAR_MIN}, and {SHRT_MIN} that these are maximum acceptable values.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The minimum value for {CHILD_MAX} is 25. This is a FIPS requirement.
- The minimum value for {OPEN_MAX} is 20. This is a FIPS requirement.
- The minimum value for {NGROUPS_MAX} is 8. This is also a FIPS requirement.

Symbolic constants are added for {_POSIX_SYMLINK_MAX}, {_POSIX_SYMLOOP_MAX}, {_POSIX_RE_DUP_MAX}, {RE_DUP_MAX}, {SYMLOOP_MAX}, and {SYMLINK_MAX}.

The following values are added for alignment with IEEE Std 1003.1d-1999:

{_POSIX_SS_REPL_MAX}
{SS_REPL_MAX}
{POSIX_ALLOC_SIZE_MIN}
{POSIX_REC_INCR_XFER_SIZE}
{POSIX_REC_MAX_XFER_SIZE}
{POSIX_REC_MIN_XFER_SIZE}
{POSIX_REC_XFER_ALIGN}

Reference to CLOCK_MONOTONIC is added in the description of {_POSIX_CLOCKRES_MIN} for alignment with IEEE Std 1003.1j-2000.

The constants {LLONG_MIN}, {LLONG_MAX}, and {ULLONG_MAX} are added for alignment with the ISO/IEC 9899:1999 standard.

The following values are added for alignment with IEEE Std 1003.1q-2000: |

{_POSIX_TRACE_EVENT_NAME_MAX}
{_POSIX_TRACE_NAME_MAX}
{_POSIX_TRACE_SYS_MAX}
{_POSIX_TRACE_USER_EVENT_MAX}
{TRACE_EVENT_NAME_MAX}
{TRACE_NAME_MAX}
{TRACE_SYS_MAX}
{TRACE_USER_EVENT_MAX}

The new limits {_XOPEN_NAME_MAX} and {_XOPEN_PATH_MAX} are added as minimum values for {PATH_MAX} and {NAME_MAX} limits on XSI-conformant systems.

The legacy symbols {PASS_MAX} and {TMP_MAX} are removed.

The values for the limits {CHAR_BIT}, {CHAR_MAX}, {SCHAR_MAX}, and {UCHAR_MAX} are now required to be 8, +127, 255, and −128, respectively.

NAME

locale.h — category macros

SYNOPSIS

```
#include <locale.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The **<locale.h>** header shall provide a definition for structure **lconv**, which shall include at least the following members. (See the definitions of *LC_MONETARY* in the Section 7.3.3 (on page 138), and Section 7.4.4 (on page 141).)

```
char    *currency_symbol
char    *decimal_point
char     frac_digits
char    *grouping
char    *int_curr_symbol
char     int_frac_digits
char     int_n_cs_precedes
char     int_n_sep_by_space
char     int_n_sign_posn
char     int_p_cs_precedes
char     int_p_sep_by_space
char     int_p_sign_posn
char    *mon_decimal_point
char    *mon_grouping
char    *mon_thousands_sep
char    *negative_sign
char     n_cs_precedes
char     n_sep_by_space
char     n_sign_posn
char    *positive_sign
char     p_cs_precedes
char     p_sep_by_space
char     p_sign_posn
char    *thousands_sep
```

The **<locale.h>** header shall define NULL (as defined in **<stddef.h>**) and at least the following as macros:

LC_ALL
LC_COLLATE
LC_CTYPE
CX *LC_MESSAGES*
LC_MONETARY
LC_NUMERIC
LC_TIME

which shall expand to distinct integer constant expressions, for use as the first argument to the *setlocale*( ) function.

Additional macro definitions, beginning with the characters *LC_* and an uppercase letter, may also be given here.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
struct  lconv *localeconv (void);
char   *setlocale(int, const char *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std 1003.1-200x, *localeconv*( ), *setlocale*( ), Chapter 8 (on page 157)

CHANGE HISTORY

First released in Issue 3.

Entry included for alignment with the ISO C standard.

Issue 6

The **lconv** structure is expanded with new members (**int_n_cs_precedes**, **int_n_sep_by_space**, **int_n_sign_posn**, **int_p_cs_precedes**, **int_p_sep_by_space**, and **int_p_sign_posn**) for alignment with the ISO / IEC 9899: 1999 standard.

Extensions beyond the ISO C standard are now marked.

NAME

math.h — mathematical declarations

SYNOPSIS

```
#include <math.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of these symbols in this header.

The **<math.h>** header shall include definitions for at least the following types:

float_t	A real-floating type at least as wide as **float**.
double_t	A real-floating type at least as wide as **double**, and at least as wide as **float_t**.

If FLT_EVAL_METHOD equals 0, **float_t** and **double_t** shall be **float** and **double**, respectively; if FLT_EVAL_METHOD equals 1, they shall both be **double**; if FLT_EVAL_METHOD equals 2, they shall both be **long double**; for other values of FLT_EVAL_METHOD, they are otherwise implementation-defined.

The **<math.h>** header shall define the following macros, where **real-floating** indicates that the argument shall be an expression of real-floating type:

```
int fpclassify(real-floating x);
int isfinite(real-floating x);
int isinf(real-floating x);
int isnan(real-floating x);
int isnormal(real-floating x);
int signbit(real-floating x);
int isgreater(real-floating x, real-floating y);
int isgreaterequal(real-floating x, real-floating y);
int isless(real-floating x, real-floating y);
int islessequal(real-floating x, real-floating y);
int islessgreater(real-floating x, real-floating y);
int isunordered(real-floating x, real-floating y);
```

The **<math.h>** header shall provide for the following constants. The values are of type **double** and are accurate within the precision of the **double** type.

XSI

M_E	Value of e
M_LOG2E	Value of $\log_2 e$
M_LOG10E	Value of $\log_{10} e$
M_LN2	Value of $\log_e 2$
M_LN10	Value of $\log_e 10$
M_PI	Value of π
M_PI_2	Value of $\pi/2$
M_PI_4	Value of $\pi/4$
M_1_PI	Value of $1/\pi$
M_2_PI	Value of $2/\pi$

M_2_SQRTPI	Value of $2/\sqrt{\pi}$
M_SQRT2	Value of $\sqrt{2}$
M_SQRT1_2	Value of $1/\sqrt{2}$

The header shall define the following symbolic constants:

XSI MAXFLOAT	Value of maximum non-infinite single-precision floating-point number.
HUGE_VAL	A positive **double** expression, not necessarily representable as a **float**. Used as an error value returned by the mathematics library. HUGE_VAL evaluates to +infinity on systems supporting IEEE Std 754-1985.
HUGE_VALF	A positive **float** constant expression. Used as an error value returned by the mathematics library. HUGE_VALF evaluates to +infinity on systems supporting IEEE Std 754-1985.
HUGE_VALL	A positive **long double** constant expression. Used as an error value returned by the mathematics library. HUGE_VALL evaluates to +infinity on systems supporting IEEE Std 754-1985.
INFINITY	A constant expression of type **float** representing positive or unsigned infinity, if available; else a positive constant of type **float** that overflows at translation time.
NAN	A constant expression of type **float** representing a quiet NaN. This symbolic constant is only defined if the implementation supports quiet NaNs for the **float** type.

The following macros shall be defined for number classification. They represent the mutually-exclusive kinds of floating-point values. They expand to integer constant expressions with distinct values. Additional implementation-defined floating-point classifications, with macro definitions beginning with FP_ and an uppercase letter, may also be specified by the implementation.

FP_INFINITE
FP_NAN
FP_NORMAL
FP_SUBNORMAL
FP_ZERO

The following optional macros indicate whether the *fma*( ) family of functions are fast compared with direct code:

FP_FAST_FMA
FP_FAST_FMAF
FP_FAST_FMAL

The FP_FAST_FMA macro shall be defined to indicate that the *fma*( ) function generally executes about as fast as, or faster than, a multiply and an add of **double** operands. The other macros have the equivalent meaning for the **float** and **long double** versions.

The following macros shall expand to integer constant expressions whose values are returned by *ilogb*(*x*) if *x* is zero or NaN, respectively. The value of FP_ILOGB0 shall be either {INT_MIN} or −{INT_MAX}. The value of FP_ILOGBNAN shall be either {INT_MAX} or {INT_MIN}.

FP_ILOGB0
FP_ILOGBNAN

The following macros shall expand to the integer constants 1 and 2, respectively;

MATH_ERRNO
MATH_ERREXCEPT

The following macro shall expand to an expression that has type **int** and the value MATH_ERRNO, MATH_ERREXCEPT, or the bitwise-inclusive OR of both:

math_errhandling

The value of math_errhandling is constant for the duration of the program. It is unspecified whether math_errhandling is a macro or an identifier with external linkage. If a macro definition is suppressed or a program defines an identifier with the name math_errhandling , the behavior is undefined. If the expression (math_errhandling & MATH_ERREXCEPT) can be non-zero, the implementation shall define the macros FE_DIVBYZERO, FE_INVALID, and FE_OVERFLOW in **<fenv.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
double      acos(double);
float       acosf(float);
double      acosh(double);
float       acoshf(float);
long double acoshl(long double);
long double acosl(long double);
double      asin(double);
float       asinf(float);
double      asinh(double);
float       asinhf(float);
long double asinhl(long double);
long double asinl(long double);
double      atan(double);
double      atan2(double, double);
float       atan2f(float, float);
long double atan2l(long double, long double);
float       atanf(float);
double      atanh(double);
float       atanhf(float);
long double atanhl(long double);
long double atanl(long double);
double      cbrt(double);
float       cbrtf(float);
long double cbrtl(long double);
double      ceil(double);
float       ceilf(float);
long double ceill(long double);
double      copysign(double, double);
float       copysignf(float, float);
long double copysignl(long double, long double);
double      cos(double);
float       cosf(float);
double      cosh(double);
float       coshf(float);
long double coshl(long double);
```

```
        long double cosl(long double);
        double      erf(double);
        double      erfc(double);
        float       erfcf(float);
        long double erfcl(long double);
        float       erff(float);
        long double erfl(long double);
        double      exp(double);
        double      exp2(double);
        float       exp2f(float);
        long double exp2l(long double);
        float       expf(float);
        long double expl(long double);
        double      expm1(double);
        float       expm1f(float);
        long double expm1l(long double);
        double      fabs(double);
        float       fabsf(float);
        long double fabsl(long double);
        double      fdim(double, double);
        float       fdimf(float, float);
        long double fdiml(long double, long double);
        double      floor(double);
        float       floorf(float);
        long double floorl(long double);
        double      fma(double, double, double);
        float       fmaf(float, float, float);
        long double fmal(long double, long double, long double);
        double      fmax(double, double);
        float       fmaxf(float, float);
        long double fmaxl(long double, long double);
        double      fmin(double, double);
        float       fminf(float, float);
        long double fminl(long double, long double);
        double      fmod(double, double);
        float       fmodf(float, float);
        long double fmodl(long double, long double);
        double      frexp(double, int *);
        float       frexpf(float value, int *);
        long double frexpl(long double value, int *);
        double      hypot(double, double);
        float       hypotf(float, float);
        long double hypotl(long double, long double);
        int         ilogb(double);
        int         ilogbf(float);
        int         ilogbl(long double);
XSI     double      j0(double);
        double      j1(double);
        double      jn(int, double);
        double      ldexp(double, int);
        float       ldexpf(float, int);
        long double ldexpl(long double, int);
```

```
double      lgamma(double);
float       lgammaf(float);
long double lgammal(long double);
long long   llrint(double);
long long   llrintf(float);
long long   llrintl(long double);
long long   llround(double);
long long   llroundf(float);
long long   llroundl(long double);
double      log(double);
double      log10(double);
float       log10f(float);
long double log10l(long double);
double      log1p(double);
float       log1pf(float);
long double log1pl(long double);
double      log2(double);
float       log2f(float);
long double log2l(long double);
double      logb(double);
float       logbf(float);
long double logbl(long double);
float       logf(float);
long double logl(long double);
long        lrint(double);
long        lrintf(float);
long        lrintl(long double);
long        lround(double);
long        lroundf(float);
long        lroundl(long double);
double      modf(double, double *);
float       modff(float, float *);
long double modfl(long double, long double *);
double      nan(const char *);
float       nanf(const char *);
long double nanl(const char *);
double      nearbyint(double);
float       nearbyintf(float);
long double nearbyintl(long double);
double      nextafter(double, double);
float       nextafterf(float, float);
long double nextafterl(long double, long double);
double      nexttoward(double, long double);
float       nexttowardf(float, long double);
long double nexttowardl(long double, long double);
double      pow(double, double);
float       powf(float, float);
long double powl(long double, long double);
double      remainder(double, double);
float       remainderf(float, float);
long double remainderl(long double, long double);
double      remquo(double, double, int *);
```

```
float       remquof(float, float, int *);
long double remquol(long double, long double, int *);
double      rint(double);
float       rintf(float);
long double rintl(long double);
double      round(double);
float       roundf(float);
long double roundl(long double);
```

XSI

```
double      scalb(double, double);
```

```
double      scalbln(double, long);
float       scalblnf(float, long);
long double scalblnl(long double, long);
double      scalbn(double, int);
float       scalbnf(float, int);
long double scalbnl(long double, int);
double      sin(double);
float       sinf(float);
double      sinh(double);
float       sinhf(float);
long double sinhl(long double);
long double sinl(long double);
double      sqrt(double);
float       sqrtf(float);
long double sqrtl(long double);
double      tan(double);
float       tanf(float);
double      tanh(double);
float       tanhf(float);
long double tanhl(long double);
long double tanl(long double);
double      tgamma(double);
float       tgammaf(float);
long double tgammal(long double);
double      trunc(double);
float       truncf(float);
long double truncl(long double);
```

XSI

```
double      y0(double);
double      y1(double);
double      yn(int, double);
```

The following external variable shall be defined:

XSI

```
extern int signgam;
```

The behavior of each of the functions defined in **<math.h>** is specified in the System Interfaces volume of IEEE Std 1003.1-200x for all representable values of its input arguments, except where stated otherwise. Each function shall execute as if it were a single operation without generating any externally visible exceptional conditions.

APPLICATION USAGE

The FP_CONTRACT pragma can be used to allow (if the state is on) or disallow (if the state is off) the implementation to contract expressions. Each pragma can occur either outside external declarations or preceding all explicit declarations and statements inside a compound statement. When outside external declarations, the pragma takes effect from its occurrence until another FP_CONTRACT pragma is encountered, or until the end of the translation unit. When inside a compound statement, the pragma takes effect from its occurrence until another FP_CONTRACT pragma is encountered (including within a nested compound statement), or until the end of the compound statement; at the end of a compound statement the state for the pragma is restored to its condition just before the compound statement. If this pragma is used in any other context, the behavior is undefined. The default state (on or off) for the pragma is implementation-defined.

RATIONALE

Before the ISO/IEC 9899:1999 standard, the math library was defined only for the floating type **double**. All the names formed by appending `'f'` or `'l'` to a name in **<math.h>** were reserved to allow for the definition of **float** and **long double** libraries; and the ISO/IEC 9899:1999 standard provides for all three versions of math functions.

The functions *ecvt*( ), *fcvt*( ), and *gcvt*( ) have been dropped from the ISO C standard since their capability is available through *sprintf*( ). These are provided on XSI-conformant systems supporting the Legacy Option Group.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1.

Issue 6

This reference page is updated to align with the ISO/IEC 9899:1999 standard.

NAME

monetary.h — monetary types

SYNOPSIS

XSI
```
#include <monetary.h>
```

DESCRIPTION

The **<monetary.h>** header shall define the following types:

size_t	As described in **<stddef.h>**.
ssize_t	As described in **<sys/types.h>**.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

```
ssize_t  strfmon(char *restrict, size_t, const char *restrict, ...);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std 1003.1-200x, *strfmon*( )

CHANGE HISTORY

First released in Issue 4.

Issue 6

The **restrict** keyword is added to the prototype for *strfmon*( ).

NAME

mqueue.h — message queues (**REALTIME**)

SYNOPSIS

MSG
```
#include <mqueue.h>
```

DESCRIPTION

The **<mqueue.h>** header shall define the **mqd_t** type, which is used for message queue descriptors. This is not an array type.

The **<mqueue.h>** header shall define the **sigevent** structure (as described in **<signal.h>**) and the **mq_attr** structure, which is used in getting and setting the attributes of a message queue. Attributes are initially set when the message queue is created. An **mq_attr** structure shall have at least the following fields:

`long`	`mq_flags`	Message queue flags.
`long`	`mq_maxmsg`	Maximum number of messages.
`long`	`mq_msgsize`	Maximum message size.
`long`	`mq_curmsgs`	Number of messages currently queued.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided. |

```
int      mq_close(mqd_t);
int      mq_getattr(mqd_t, struct mq_attr *);
int      mq_notify(mqd_t, const struct sigevent *);
mqd_t    mq_open(const char *, int, ...);
ssize_t  mq_receive(mqd_t, char *, size_t, unsigned *);
int      mq_send(mqd_t, const char *, size_t, unsigned );
int      mq_setattr(mqd_t, const struct mq_attr *restrict,
             struct mq_attr *restrict);
```
TMO
```
ssize_t  mq_timedreceive(mqd_t, char *restrict, size_t,
             unsigned *restrict, const struct timespec *restrict);
int      mq_timedsend(mqd_t, const char *, size_t, unsigned ,
             const struct timespec *);
```
```
int      mq_unlink(const char *);
```

Inclusion of the **<mqueue.h>** header may make visible symbols defined in the headers **<fcntl.h>**, **<signal.h>**, **<sys/types.h>**, and **<time.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<fcntl.h>, **<signal.h>**, **<sys/types.h>**, **<time.h>**, the System Interfaces volume of IEEE Std 1003.1-200x, *mq_close*( ), *mq_getattr*( ), *mq_notify*( ), *mq_open*( ), *mq_receive*( ), *mq_send*( ), *mq_setattr*( ), *mq_timedreceive*( ), *mq_timedsend*( ), *mq_unlink*( )

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The **<mqueue.h>** header is marked as part of the Message Passing option.

The *mq_timedreceive*( ) and *mq_timedsend*( ) functions are added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the prototypes for *mq_setattr*( ) and *mq_timedreceive*( ).

<ndbm.h>

NAME

ndbm.h — definitions for ndbm database operations

SYNOPSIS

XSI

```
#include <ndbm.h>
```

DESCRIPTION

The **<ndbm.h>** header shall define the **datum** type as a structure that includes at least the following members:

`void`	`*dptr`	A pointer to the application's data.
`size_t`	`dsize`	The size of the object pointed to by *dptr*.

The **size_t** type shall be defined as described in **<stddef.h>**.

The **<ndbm.h>** header shall define the **DBM** type.

The following constants shall be defined as possible values for the *store_mode* argument to *dbm_store*( ):

DBM_INSERT	Insertion of new entries only.
DBM_REPLACE	Allow replacing existing entries.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int     dbm_clearerr(DBM *);
void    dbm_close(DBM *);
int     dbm_delete(DBM *, datum);
int     dbm_error(DBM *);
datum   dbm_fetch(DBM *, datum);
datum   dbm_firstkey(DBM *);
datum   dbm_nextkey(DBM *);
DBM    *dbm_open(const char *, int, mode_t);
int     dbm_store(DBM *, datum, datum, int);
```

The **mode_t** type shall be defined through **typedef** as described in **<sys/types.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std 1003.1-200x, *dbm_clearerr*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

References to the definitions of **size_t** and **mode_t** are added to the DESCRIPTION.

NAME

net / if.h — sockets local interfaces

SYNOPSIS

```
#include <net/if.h>
```

DESCRIPTION

The **<net/if.h>** header shall define the **if_nameindex** structure that includes at least the following members:

`unsigned  if_index`	Numeric index of the interface.
`char     *if_name`	Null-terminated name of the interface.

The **<net/if.h>** header shall define the following macro for the length of a buffer containing an interface name (including the terminating NULL character):

IF_NAMESIZE	Interface name length.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
unsigned              if_nametoindex(const char *);
char                 *if_indextoname(unsigned, char *);
struct if_nameindex  *if_nameindex(void);
void                  if_freenameindex(struct if_nameindex *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std 1003.1-200x, *if_freenameindex*( ), *if_indextoname*( ), *if_nameindex*( ), *if_nametoindex*( )

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

netdb.h — definitions for network database operations

SYNOPSIS

```
#include <netdb.h>
```

DESCRIPTION

The **<netdb.h>** header may define the **in_port_t** type and the **in_addr_t** type as described in **<netinet/in.h>**.

The **<netdb.h>** header shall define the **hostent** structure that includes at least the following members:

`char`	`*h_name`	Official name of the host.
`char`	`**h_aliases`	A pointer to an array of pointers to alternative host names, terminated by a null pointer.
`int`	`h_addrtype`	Address type.
`int`	`h_length`	The length, in bytes, of the address.
`char`	`**h_addr_list`	A pointer to an array of pointers to network addresses (in network byte order) for the host, terminated by a null pointer.

The **<netdb.h>** header shall define the **netent** structure that includes at least the following members:

`char`	`*n_name`	Official, fully-qualified (including the domain) name of the host.
`char`	`**n_aliases`	A pointer to an array of pointers to alternative network names, terminated by a null pointer.
`int`	`n_addrtype`	The address type of the network.
`uint32_t`	`n_net`	The network number, in host byte order.

The **uint32_t** type shall be defined as described in **<inttypes.h>**.

The **<netdb.h>** header shall define the **protoent** structure that includes at least the following members:

`char`	`*p_name`	Official name of the protocol.
`char`	`**p_aliases`	A pointer to an array of pointers to alternative protocol names, terminated by a null pointer.
`int`	`p_proto`	The protocol number.

The **<netdb.h>** header shall define the **servent** structure that includes at least the following members:

`char`	`*s_name`	Official name of the service.
`char`	`**s_aliases`	A pointer to an array of pointers to alternative service names, terminated by a null pointer.
`int`	`s_port`	The port number at which the service resides, in network byte order.
`char`	`*s_proto`	The name of the protocol to use when contacting the service.

The **<netdb.h>** header shall define the IPPORT_RESERVED macro with the value of the highest reserved Internet port number.

OB When the **<netdb.h>** header is included, *h_errno* shall be available as a modifiable *l*-value of type **int**. It is unspecified whether *h_errno* is a macro or an identifier declared with external linkage.

The **<netdb.h>** header shall define the following macros for use as error values for *gethostbyaddr*( ) and *gethostbyname*( ):

HOST_NOT_FOUND
NO_DATA
NO_RECOVERY
TRY_AGAIN

Address Information Structure

The **<netdb.h>** header shall define the **addrinfo** structure that includes at least the following members:

`int`	`ai_flags`	Input flags.
`int`	`ai_family`	Address family of socket.
`int`	`ai_socktype`	Socket type.
`int`	`ai_protocol`	Protocol of socket.
`socklen_t`	`ai_addrlen`	Length of socket address.
`struct sockaddr`	`*ai_addr`	Socket address of socket.
`char`	`*ai_canonname`	Canonical name of service location.
`struct addrinfo`	`*ai_next`	Pointer to next in list.

The **<netdb.h>** header shall define the following macros that evaluate to bitwise-distinct integer constants for use in the *flags* field of the **addrinfo** structure:

AI_PASSIVE	Socket address is intended for *bind*( ).
AI_CANONNAME	Request for canonical name.
AI_NUMERICHOST	Return numeric host address as name.
AI_NUMERICSERV	Inhibit service name resolution.
AI_V4MAPPED	If no IPv6 addresses are found, query for IPv4 addresses and return them to the caller as IPv4-mapped IPv6 addresses.
AI_ALL	Query for both IPv4 and IPv6 addresses.
AI_ADDRCONFIG	Query for IPv4 addresses only when an IPv4 address is configured; query for IPv6 addresses only when an IPv6 address is configured.

The **<netdb.h>** header shall define the following macros that evaluate to bitwise-distinct integer constants for use in the *flags* argument to *getnameinfo*( ):

NI_NOFQDN	Only the nodename portion of the FQDN is returned for local hosts.
NI_NUMERICHOST	The numeric form of the node's address is returned instead of its name.

NI_NAMEREQD	Return an error if the node's name cannot be located in the database.
NI_NUMERICSERV	The numeric form of the service address is returned instead of its name.
NI_DGRAM	Indicates that the service is a datagram service (SOCK_DGRAM).

Address Information Errors

The **<netdb.h>** header shall define the following macros for use as error values for *getaddrinfo*( ) and *getnameinfo*( ):

EAI_AGAIN	The name could not be resolved at this time. Future attempts may succeed.
EAI_BADFLAGS	The flags had an invalid value.
EAI_FAIL	A non-recoverable error occurred.
EAI_FAMILY	The address family was not recognized or the address length was invalid for the specified family.
EAI_MEMORY	There was a memory allocation failure.
EAI_NONAME	The name does not resolve for the supplied parameters. NI_NAMEREQD is set and the host's name cannot be located, or both *nodename* and *servname* were null.
EAI_SERVICE	The service passed was not recognized for the specified socket type.
EAI_SOCKTYPE	The intended socket type was not recognized.
EAI_SYSTEM	A system error occurred. The error code can be found in *errno*.
EAI_OVERFLOW	An argument buffer overflowed.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
void             endhostent(void);
void             endnetent(void);
void             endprotoent(void);
void             endservent(void);
void             freeaddrinfo(struct addrinfo *);
const char      *gai_strerror(int);
int              getaddrinfo(const char *restrict, const char *restrict,
                     const struct addrinfo *restrict,
                     struct addrinfo **restrict);
struct hostent  *gethostbyaddr(const void *, socklen_t, int);
struct hostent  *gethostbyname(const char *);
struct hostent  *gethostent(void);
int              getnameinfo(const struct sockaddr *restrict, socklen_t,
                     char *restrict, socklen_t, char *restrict,
                     socklen_t, unsigned);
struct netent   *getnetbyaddr(uint32_t, int);
struct netent   *getnetbyname(const char *);
struct netent   *getnetent(void);
struct protoent *getprotobyname(const char *);
struct protoent *getprotobynumber(int);
struct protoent *getprotoent(void);
```

```
struct servent   *getservbyname(const char *, const char *);
struct servent   *getservbyport(int, const char *);
struct servent   *getservent(void);
void              sethostent(int);
void              setnetent(int);
void              setprotoent(int);
void              setservent(int);
```

The type **socklen_t** shall be defined through **typedef** as described in **<sys/socket.h>**.

Inclusion of the **<netdb.h>** header may also make visible all symbols from **<netinet/in.h>**, **<sys/socket.h>**, and **<inttypes.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<netinet/in.h>, **<inttypes.h>**, **<sys/socket.h>**, the System Interfaces volume of IEEE Std 1003.1-200x, *bind*( ), *endhostent*( ), *endnetent*( ), *endprotoent*( ), *endservent*( ), *getaddrinfo*( ), *getnameinfo*( )

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The Open Group Base Resolution bwg2001-009 is applied, which changes the return type for *gai_strerror*( ) from **char *** to **const char ***. This is for coordination with the IPnG Working Group.

NAME

netinet/in.h — Internet address family

SYNOPSIS

```
#include <netinet/in.h>
```

DESCRIPTION

The **<netinet/in.h>** header shall define the following types:

in_port_t	Equivalent to the type **uint16_t** as defined in **<inttypes.h>**.
in_addr_t	Equivalent to the type **uint32_t** as defined in **<inttypes.h>**.

The **sa_family_t** type shall be defined as described in **<sys/socket.h>**.

The **uint8_t** and **uint32_t** type shall be defined as described in **<inttypes.h>**. Inclusion of the **<netinet/in.h>** header may also make visible all symbols from **<inttypes.h>** and **<sys/socket.h>**.

The **<netinet/in.h>** header shall define the **in_addr** structure that includes at least the following member:

```
in_addr_t  s_addr
```

The **<netinet/in.h>** header shall define the **sockaddr_in** structure that includes at least the following members (all in network byte order):

`sa_family_t`	`sin_family`	AF_INET.
`in_port_t`	`sin_port`	Port number.
`struct in_addr`	`sin_addr`	IP address.

The **sockaddr_in** structure is used to store addresses for the Internet address family. Values of this type shall be cast by applications to **struct sockaddr** for use with socket functions.

IP6 The **<netinet/in.h>** header shall define the **in6_addr** structure that contains at least the following member:

```
uint8_t s6_addr[16]
```

This array is used to contain a 128-bit IPv6 address, stored in network byte order.

The **<netinet/in.h>** header shall define the **sockaddr_in6** structure that includes at least the following members (all in network byte order):

`sa_family_t`	`sin6_family`	AF_INET6.
`in_port_t`	`sin6_port`	Port number.
`uint32_t`	`sin6_flowinfo`	IPv6 traffic class and flow information.
`struct in6_addr`	`sin6_addr`	IPv6 address.
`uint32_t`	`sin6_scope_id`	Set of interfaces for a scope.

The **sockaddr_in6** structure shall be set to zero by an application prior to using it, since implementations are free to have additional, implementation-defined fields in **sockaddr_in6**.

The *sin6_scope_id* field is a 32-bit integer that identifies a set of interfaces as appropriate for the scope of the address carried in the *sin6_addr* field. For a link scope *sin6_addr*, *sin6_scope_id* would be an interface index. For a site scope *sin6_addr*, *sin6_scope_id* would be a site identifier. The mapping of *sin6_scope_id* to an interface or set of interfaces is implementation-defined.

The **<netinet/in.h>** header shall declare the following external variable:

```
struct in6_addr in6addr_any
```

This variable is initialized by the system to contain the wildcard IPv6 address. The **<netinet/in.h>** header also defines the IN6ADDR_ANY_INIT macro. This macro must be constant at compile time and can be used to initialize a variable of type **struct in6_addr** to the IPv6 wildcard address.

The **<netinet/in.h>** header shall declare the following external variable:

```
struct in6_addr in6addr_loopback
```

This variable is initialized by the system to contain the loopback IPv6 address. The **<netinet/in.h>** header also defines the IN6ADDR_LOOPBACK_INIT macro. This macro must be constant at compile time and can be used to initialize a variable of type **struct in6_addr** to the IPv6 loopback address.

The **<netinet/in.h>** header shall define the **ipv6_mreq** structure that includes at least the following members:

`struct in6_addr`	`ipv6mr_multiaddr`	IPv6 multicast address.
`unsigned`	`ipv6mr_interface`	Interface index.

The **<netinet/in.h>** header shall define the following macros for use as values of the *level* argument of *getsockopt*( ) and *setsockopt*( ):

	IPPROTO_IP	Internet protocol.
IP6	IPPROTO_IPV6	Internet Protocol Version 6.
	IPPROTO_ICMP	Control message protocol.
RS	IPPROTO_RAW	Raw IP Packets Protocol.
	IPPROTO_TCP	Transmission control protocol.
	IPPROTO_UDP	User datagram protocol.

The **<netinet/in.h>** header shall define the following macros for use as destination addresses for *connect*( ), *sendmsg*( ), and *sendto*( ):

INADDR_ANY	IPv4 local host address.
INADDR_BROADCAST	IPv4 broadcast address.

The **<netinet/in.h>** header shall define the following macro to help applications declare buffers of the proper size to store IPv4 addresses in string form:

INET_ADDRSTRLEN 16. Length of the string form for IP. |

The *htonl*( ), *htons*( ), *ntohl*( ), and *ntohs*( ) functions shall be available as defined in **<arpa/inet.h>**. Inclusion of the **<netinet/in.h>** header may also make visible all symbols from **<arpa/inet.h>**.

IP6 The **<netinet/in.h>** header shall define the following macro to help applications declare buffers of the proper size to store IPv6 addresses in string form:

INET6_ADDRSTRLEN 46. Length of the string form for IPv6. |

The **<netinet/in.h>** header shall define the following macros, with distinct integer values, for use in the *option_name* argument in the *getsockopt*( ) or *setsockopt*( ) functions at protocol level IPPROTO_IPV6:

IPV6_JOIN_GROUP	Join a multicast group.
IPV6_LEAVE_GROUP	Quit a multicast group.
IPV6_MULTICAST_HOPS	Multicast hop limit.

IPV6_MULTICAST_IF	Interface to use for outgoing multicast packets.
IPV6_MULTICAST_LOOP	Multicast packets are delivered back to the local application.
IPV6_UNICAST_HOPS	Unicast hop limit.
IPV6_V6ONLY	Restrict AF_INET6 socket to IPv6 communications only.

The **<netinet/in.h>** header shall define the following macros that test for special IPv6 addresses. Each macro is of type **int** and takes a single argument of type **const struct in6_addr ***:

IN6_IS_ADDR_UNSPECIFIED
Unspecified address.

IN6_IS_ADDR_LOOPBACK
Loopback address.

IN6_IS_ADDR_MULTICAST
Multicast address.

IN6_IS_ADDR_LINKLOCAL
Unicast link-local address.

IN6_IS_ADDR_SITELOCAL
Unicast site-local address.

IN6_IS_ADDR_V4MAPPED
IPv4 mapped address.

IN6_IS_ADDR_V4COMPAT
IPv4-compatible address.

IN6_IS_ADDR_MC_NODELOCAL
Multicast node-local address.

IN6_IS_ADDR_MC_LINKLOCAL
Multicast link-local address.

IN6_IS_ADDR_MC_SITELOCAL
Multicast site-local address.

IN6_IS_ADDR_MC_ORGLOCAL
Multicast organization-local address.

IN6_IS_ADDR_MC_GLOBAL
Multicast global address.

IN6_IS_ADDR_LINKLOCAL and IN6_IS_ADDR_SITELOCAL return true only for the two local-use IPv6 unicast addresses. They do not return true for multicast addresses of either link-local or site-local scope.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The *sin_zero* member was removed from the **sockaddr_in** structure as per The Open Group Base Resolution bwg2001-004.

NAME

netinet/tcp.h — definitions for the Internet Transmission Control Protocol (TCP)

SYNOPSIS

```
#include <netinet/tcp.h>
```

DESCRIPTION

The **<netinet/tcp.h>** header shall define the following macro for use as a socket option at the IPPROTO_TCP level:

TCP_NODELAY	Avoid coalescing of small segments.

The macro shall be defined in the header. The implementation need not allow the value of the option to be set via *setsockopt*( ) or retrieved via *getsockopt*( ).

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

nl_types.h — data types

SYNOPSIS

XSI
```
#include <nl_types.h>
```

DESCRIPTION

The **<nl_types.h>** header shall contain definitions of at least the following types:

nl_catd	Used by the message catalog functions *catopen*( ), *catgets*( ), and *catclose*( ) to identify a catalog descriptor.
nl_item	Used by *nl_langinfo*( ) to identify items of *langinfo* data. Values of objects of type **nl_item** are defined in **<langinfo.h>**.

The **<nl_types.h>** header shall contain definitions of at least the following constants:

NL_SETD	Used by *gencat* when no $*set* directive is specified in a message text source file; see the Internationalization Guide. This constant can be passed as the value of *set_id* on subsequent calls to *catgets*( ) (that is, to retrieve messages from the default message set). The value of NL_SETD is implementation-defined.
NL_CAT_LOCALE	Value that must be passed as the *oflag* argument to *catopen*( ) to ensure that message catalog selection depends on the *LC_MESSAGES* locale category, rather than directly on the *LANG* environment variable.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int       catclose(nl_catd);
char     *catgets(nl_catd, int, int, const char *);
nl_catd   catopen(const char *, int);
```

APPLICATION USAGE

None.

RATIONALE

CHANGE HISTORY

First released in Issue 2.

NAME

poll.h — definitions for the poll( ) function

SYNOPSIS

XSI

```
#include <poll.h>
```

DESCRIPTION

The **<poll.h>** header shall define the **pollfd** structure that includes at least the following members:

`int`	`fd`	The following descriptor being polled.
`short`	`events`	The input event flags (see below).
`short`	`revents`	The output event flags (see below).

The **<poll.h>** header shall define the following type through **typedef**:

nfds_t	An unsigned integer type used for the number of file descriptors.

The implementation shall support one or more programming environments in which the width of **nfds_t** is no greater than the width of type **long**. The names of these programming environments can be obtained using the *confstr*( ) function or the *getconf* utility.

The following symbolic constants shall be defined, zero or more of which may be OR'ed together to form the *events* or *revents* members in the **pollfd** structure:

POLLIN	Data other than high-priority data may be read without blocking.
POLLRDNORM	Normal data may be read without blocking.
POLLRDBAND	Priority data may be read without blocking.
POLLPRI	High priority data may be read without blocking.
POLLOUT	Normal data may be written without blocking.
POLLWRNORM	Equivalent to POLLOUT.
POLLWRBAND	Priority data may be written.
POLLERR	An error has occurred (*revents* only).
POLLHUP	Device has been disconnected (*revents* only).
POLLNVAL	Invalid *fd* member (*revents* only).

The significance and semantics of normal, priority, and high-priority data are file and device-specific.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

```
int    poll(struct pollfd[], nfds_t, int);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 6

The description of the symbolic constants is updated to match the *poll*( ) function.

Text related to STREAMS has been moved to the *poll*( ) reference page.

A note is added to the DESCRIPTION regarding the significance and semantics of normal, priority, and high-priority data.

NAME

pthread.h — threads

SYNOPSIS

THR
```
#include <pthread.h>
```

DESCRIPTION

The **<pthread.h>** header shall define the following symbols:

BAR PTHREAD_BARRIER_SERIAL_THREAD
PTHREAD_CANCEL_ASYNCHRONOUS
PTHREAD_CANCEL_ENABLE
PTHREAD_CANCEL_DEFERRED
PTHREAD_CANCEL_DISABLE
PTHREAD_CANCELED
PTHREAD_COND_INITIALIZER
PTHREAD_CREATE_DETACHED
PTHREAD_CREATE_JOINABLE
PTHREAD_EXPLICIT_SCHED
PTHREAD_INHERIT_SCHED
XSI PTHREAD_MUTEX_DEFAULT
PTHREAD_MUTEX_ERRORCHECK
PTHREAD_MUTEX_INITIALIZER
XSI PTHREAD_MUTEX_NORMAL
PTHREAD_MUTEX_RECURSIVE
PTHREAD_ONCE_INIT
TPP | TPI PTHREAD_PRIO_INHERIT
PTHREAD_PRIO_NONE
PTHREAD_PRIO_PROTECT
PTHREAD_PROCESS_SHARED
PTHREAD_PROCESS_PRIVATE
TPS PTHREAD_SCOPE_PROCESS
PTHREAD_SCOPE_SYSTEM

The following types shall be defined as described in **<sys/types.h>**:

pthread_attr_t
BAR **pthread_barrier_t**
pthread_barrierattr_t
pthread_cond_t
pthread_condattr_t
pthread_key_t
pthread_mutex_t
pthread_mutexattr_t
pthread_once_t
pthread_rwlock_t
pthread_rwlockattr_t
SPI **pthread_spinlock_t**
pthread_t

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
          int    pthread_atfork(void (*)(void), void (*)(void),
                     void(*)(void));
          int    pthread_attr_destroy(pthread_attr_t *);
          int    pthread_attr_getdetachstate(const pthread_attr_t *, int *);
XSI       int    pthread_attr_getguardsize(const pthread_attr_t *restrict,
                     size_t *restrict);
TPS       int    pthread_attr_getinheritsched(const pthread_attr_t *restrict,
                     int *restrict);
          int    pthread_attr_getschedparam(const pthread_attr_t *restrict,
                     struct sched_param *restrict);
TPS       int    pthread_attr_getschedpolicy(const pthread_attr_t *restrict,
                     int *restrict);
TPS       int    pthread_attr_getscope(const pthread_attr_t *restrict,
                     int *restrict);
XSI       int    pthread_attr_getstack(const pthread_attr_t *restrict,
                     void **restrict, size_t *restrict);
TSA       int    pthread_attr_getstackaddr(const pthread_attr_t *restrict,
                     void **restrict);
          int    pthread_attr_getstacksize(const pthread_attr_t *restrict,
                     size_t *restrict);
          int    pthread_attr_init(pthread_attr_t *);
          int    pthread_attr_setdetachstate(pthread_attr_t *, int);
XSI       int    pthread_attr_setguardsize(pthread_attr_t *, size_t);
TPS       int    pthread_attr_setinheritsched(pthread_attr_t *, int);
          int    pthread_attr_setschedparam(pthread_attr_t *restrict,
                     const struct sched_param *restrict);

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The RTT margin markers are now broken out into their POSIX options.

The Open Group Corrigendum U021/9 is applied, correcting the prototype for the *pthread_cond_wait*( ) function.

The Open Group Corrigendum U026/2 is applied correcting the prototype for the *pthread_setschedparam*( ) function so that its second argument is of type **int**.

The *pthread_getcpuclockid*( ) and *pthread_mutex_timedlock*( ) functions are added for alignment with IEEE Std 1003.1d-1999.

The following functions are added for alignment with IEEE Std 1003.1j-2000: *pthread_barrier_destroy*( ), *pthread_barrier_init*( ), *pthread_barrier_wait*( ), *pthread_barrierattr_destroy*( ), *pthread_barrierattr_getpshared*( ), *pthread_barrierattr_init*( ), *pthread_barrierattr_setpshared*( ), *pthread_condattr_getclock*( ), *pthread_condattr_setclock*( ), *pthread_rwlock_timedrdlock*( ), *pthread_rwlock_timedwrlock*( ), *pthread_spin_destroy*( ), *pthread_spin_init*( ), *pthread_spin_lock*( ), *pthread_spin_trylock*( ), and *pthread_spin_unlock*( ).

PTHREAD_RWLOCK_INITIALIZER is deleted for alignment with IEEE Std 1003.1j-2000.

Functions previously marked as part of the Read-Write Locks option are now moved to the Threads option.

The **restrict** keyword is added to the prototypes for *pthread_attr_getguardsize*( ), *pthread_attr_getinheritsched*( ), *pthread_attr_getschedparam*( ), *pthread_attr_getschedpolicy*( ), *pthread_attr_getscope*( ), *pthread_attr_getstackaddr*( ), *pthread_attr_getstacksize*( ), *pthread_attr_setschedparam*( ), *pthread_barrier_init*( ), *pthread_barrierattr_getpshared*( ), *pthread_cond_init*( ), *pthread_cond_signal*( ), *pthread_cond_timedwait*( ), *pthread_cond_wait*( ), *pthread_condattr_getclock*( ), *pthread_condattr_getpshared*( ), *pthread_create*( ), *pthread_getschedparam*( ), *pthread_mutex_getprioceiling*( ), *pthread_mutex_init*( ), *pthread_mutex_setprioceiling*( ), *pthread_mutexattr_getprioceiling*( ), *pthread_mutexattr_getprotocol*( ), *pthread_mutexattr_getpshared*( ), *pthread_mutexattr_gettype*( ), *pthread_rwlock_init*( ), *pthread_rwlock_timedrdlock*( ), *pthread_rwlock_timedwrlock*( ), *pthread_rwlockattr_getpshared*( ), and *pthread_sigmask*( ).

IEEE PASC Interpretation 1003.1 #86 is applied, allowing the symbols from **<sched.h>** and **<time.h>** to be made visible when **<pthread.h>** is included. Previously this was an XSI extension.

IEEE PASC Interpretation 1003.1c #42 is applied, removing the requirement for prototypes for the *pthread_kill*( ) and *pthread_sigmask*( ) functions. These are required to be in the **<signal.h>** header. They are allowed here through the name space rules. |

IEEE PASC Interpretation 1003.1 #96 is applied, adding the *pthread_setschedprio*( ) function. |

NAME

pwd.h — password structure

SYNOPSIS

```
#include <pwd.h>
```

DESCRIPTION

The **<pwd.h>** header shall provide a definition for **struct passwd**, which shall include at least the following members:

`char`	`*pw_name`	User's login name.
`uid_t`	`pw_uid`	Numerical user ID.
`gid_t`	`pw_gid`	Numerical group ID.
`char`	`*pw_dir`	Initial working directory.
`char`	`*pw_shell`	Program to use as shell.

The **gid_t** and **uid_t** types shall be defined as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
    struct passwd *getpwnam(const char *);
    struct passwd *getpwuid(uid_t);
TSF int            getpwnam_r(const char *, struct passwd *, char *,
                       size_t, struct passwd **);
    int            getpwuid_r(uid_t, struct passwd *, char *,
                       size_t, struct passwd **);
XSI void           endpwent(void);
    struct passwd *getpwent(void);
    void           setpwent(void);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *endpwent*( ), *getpwnam*( ), *getpwuid*( )

CHANGE HISTORY

First released in Issue 1.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The **gid_t** and **uid_t** types are mandated.
- The *getpwnam_r*( ) and *getpwuid_r*( ) functions are marked as part of the _POSIX_THREAD_SAFE_FUNCTIONS option.

NAME

regex.h — regular expression matching types

SYNOPSIS

```
#include <regex.h>
```

DESCRIPTION

The **<regex.h>** header shall define the structures and symbolic constants used by the *regcomp*( ), *regexec*( ), *regerror*( ), and *regfree*( ) functions.

The structure type **regex_t** shall contain at least the following member:

`size_t`	`re_nsub`	Number of parenthesized subexpressions.

The type **size_t** shall be defined as described in **<sys/types.h>**.

The type **regoff_t** shall be defined as a signed integer type that can hold the largest value that can be stored in either a type **off_t** or type **ssize_t**. The structure type **regmatch_t** shall contain at least the following members:

`regoff_t`	`rm_so`	Byte offset from start of string to start of substring.
`regoff_t`	`rm_eo`	Byte offset from start of string of the first character after the end of substring.

Values for the *cflags* parameter to the *regcomp*( ) function:

REG_EXTENDED	Use Extended Regular Expressions.
REG_ICASE	Ignore case in match.
REG_NOSUB	Report only success or fail in *regexec*( ).
REG_NEWLINE	Change the handling of newline.

Values for the *eflags* parameter to the *regexec*( ) function:

REG_NOTBOL	The circumflex character (`'^'`), when taken as a special character, does not match the beginning of *string*.
REG_NOTEOL	The dollar sign (`'$'`), when taken as a special character, does not match the end of *string*.

The following constants shall be defined as error return values:

REG_NOMATCH	*regexec*( ) failed to match.
REG_BADPAT	Invalid regular expression.
REG_ECOLLATE	Invalid collating element referenced.
REG_ECTYPE	Invalid character class type referenced.
REG_EESCAPE	Trailing `'\'` in pattern.
REG_ESUBREG	Number in *digit* invalid or in error.
REG_EBRACK	`"[]"` imbalance.
REG_EPAREN	`"\(\)"` or `"()"` imbalance.
REG_EBRACE	`"\{\}"` imbalance.
REG_BADBR	Content of `"\{\}"` invalid: not a number, number too large, more than two numbers, first larger than second.

	REG_ERANGE	Invalid endpoint in range expression.
	REG_ESPACE	Out of memory.
	REG_BADRPT	`'?'`, `'*'`, or `'+'` not preceded by valid regular expression.
OB	REG_ENOSYS	Reserved.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int    regcomp(regex_t *restrict, const char *restrict, int);
size_t regerror(int, const regex_t *restrict, char *restrict, size_t);
int    regexec(const regex_t *restrict, const char *restrict, size_t,
           regmatch_t[restrict], int);
void   regfree(regex_t *);
```

The implementation may define additional macros or constants using names beginning with REG_.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std 1003.1-200x, *regcomp*( ), the Shell and Utilities volume of IEEE Std 1003.1-200x

CHANGE HISTORY

First released in Issue 4.

Originally derived from the ISO POSIX-2 standard.

Issue 6

The REG_ENOSYS constant is marked obsolescent.

The **restrict** keyword is added to the prototypes for *regcomp*( ), *regerror*( ), and *regexec*( ).

A statement is added that the **size_t** type is defined as described in **<sys/types.h>**.

NAME

sched.h — execution scheduling (**REALTIME**)

SYNOPSIS

PS
```
#include <sched.h>
```

DESCRIPTION

The **<sched.h>** header shall define the **sched_param** structure, which contains the scheduling parameters required for implementation of each supported scheduling policy. This structure shall contain at least the following member:

`int`	`sched_priority`	Process execution scheduling priority.

SS|TSP In addition, if _POSIX_SPORADIC_SERVER or _POSIX_THREAD_SPORADIC_SERVER is defined, the **sched_param** structure defined in **<sched.h>** shall contain the following members in addition to those specified above:

`int`	`sched_ss_low_priority`	Low scheduling priority for sporadic server.
`struct timespec`	`sched_ss_repl_period`	Replenishment period for sporadic server.
`struct timespec`	`sched_ss_init_budget`	Initial budget for sporadic server.
`int`	`sched_ss_max_repl`	Maximum pending replenishments for sporadic server.

Each process is controlled by an associated scheduling policy and priority. Associated with each policy is a priority range. Each policy definition specifies the minimum priority range for that policy. The priority ranges for each policy may overlap the priority ranges of other policies.

Four scheduling policies are defined; others may be defined by the implementation. The four standard policies are indicated by the values of the following symbolic constants:

	SCHED_FIFO	First in-first out (FIFO) scheduling policy.
	SCHED_RR	Round robin scheduling policy.
SS|TSP	SCHED_SPORADIC	Sporadic server scheduling policy.
	SCHED_OTHER	Another scheduling policy.

The values of these constants are distinct.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int    sched_get_priority_max(int);
int    sched_get_priority_min(int);
int    sched_getparam(pid_t, struct sched_param *);
int    sched_getscheduler(pid_t);
int    sched_rr_get_interval(pid_t, struct timespec *);
int    sched_setparam(pid_t, const struct sched_param *);
int    sched_setscheduler(pid_t, int, const struct sched_param *);
int    sched_yield(void);
```

Inclusion of the **<sched.h>** header makes symbols defined in the header **<time.h>** visible.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<time.h>

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The **<sched.h>** header is marked as part of the Process Scheduling option.

Sporadic server members are added to the **sched_param** structure, and the SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #108 is applied, correcting the **sched_param** structure whose members *sched_ss_repl_period* and *sched_ss_init_budget* members should be type **struct timespec** and not **timespec**.

NAME

search.h — search tables

SYNOPSIS

XSI
```
#include <search.h>
```

DESCRIPTION

The **<search.h>** header shall define the **ENTRY** type for structure **entry** which shall include the following members:

```
char    *key
void    *data
```

and shall define **ACTION** and **VISIT** as enumeration data types through type definitions as follows:

```
enum { FIND, ENTER } ACTION;
enum { preorder, postorder, endorder, leaf } VISIT;
```

The **size_t** type shall be defined as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int    hcreate(size_t);
void   hdestroy(void);
ENTRY *hsearch(ENTRY, ACTION);
void   insque(void *, void *);
void  *lfind(const void *, const void *, size_t *,
          size_t, int (*)(const void *, const void *));
void  *lsearch(const void *, void *, size_t *,
          size_t, int (*)(const void *, const void *));
void   remque(void *);
void  *tdelete(const void *restrict, void **restrict,
          int(*)(const void *, const void *));
void  *tfind(const void *, void *const *,
          int(*)(const void *, const void *));
void  *tsearch(const void *, void **,
          int(*)(const void *, const void *));
void   twalk(const void *,
          void (*)(const void *, VISIT, int ));
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *hcreate*( ), *insque*( ), *lsearch*( ), *remque*( ), *tsearch*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The Open Group Corrigendum U021/6 is applied updating the prototypes for *tdelete*( ) and *tsearch*( ).

The **restrict** keyword is added to the prototype for *tdelete*( ).

<semaphore.h>

NAME

semaphore.h — semaphores (**REALTIME**)

SYNOPSIS

SEM
```
#include <semaphore.h>
```

DESCRIPTION

The **<semaphore.h>** header shall define the **sem_t** type, used in performing semaphore operations. The semaphore may be implemented using a file descriptor, in which case applications are able to open up at least a total of {OPEN_MAX} files and semaphores. The symbol SEM_FAILED shall be defined (see *sem_open*( )).

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided. |

```
int    sem_close(sem_t *);
int    sem_destroy(sem_t *);
int    sem_getvalue(sem_t *restrict, int *restrict);
int    sem_init(sem_t *, int, unsigned);
sem_t *sem_open(const char *, int, ...);
int    sem_post(sem_t *);
int    sem_timedwait(sem_t *restrict, const struct timespec *restrict);
int    sem_trywait(sem_t *);
int    sem_unlink(const char *);
int    sem_wait(sem_t *);
```

TMO (sem_timedwait)

Inclusion of the **<semaphore.h>** header may make visible symbols defined in the headers **<fcntl.h>** and **<sys/types.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The **<semaphore.h>** header is marked as part of the Semaphores option.

The Open Group Corrigendum U021/3 is applied, adding a description of SEM_FAILED.

The *sem_timedwait*( ) function is added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the prototypes for *sem_getvalue*( ) and *sem_timedwait*( ).

NAME

setjmp.h — stack environment declarations

SYNOPSIS

```
#include <setjmp.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of these symbols in this header.

CX The **<setjmp.h>** header shall define the array types **jmp_buf** and **sigjmp_buf**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided. |

```
void   longjmp(jmp_buf, int);
void   siglongjmp(sigjmp_buf, int);
void  _longjmp(jmp_buf, int);
```

CX: siglongjmp; XSI: _longjmp

The following may be declared as a function, or defined as a macro, or both. Function prototypes shall be provided. |

```
int    setjmp(jmp_buf);
int    sigsetjmp(sigjmp_buf, int);
int   _setjmp(jmp_buf);
```

CX: sigsetjmp; XSI: _setjmp

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 1.

Issue 6

Extensions beyond the ISO C standard are now marked.

NAME

signal.h — signals

SYNOPSIS

```
#include <signal.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of these symbols in this header.

The **<signal.h>** header shall define the following symbolic constants, each of which expands to a distinct constant expression of the type:

```
void (*)(int)
```

whose value matches no declarable function.

SIG_DFL	Request for default signal handling.
SIG_ERR	Return value from *signal*( ) in case of error.
CX SIG_HOLD	Request that signal be held.
SIG_IGN	Request that signal be ignored.

The following data types shall be defined through **typedef**:

sig_atomic_t	Possibly volatile-qualified integer type of an object that can be accessed as an atomic entity, even in the presence of asynchronous interrupts.
CX **sigset_t**	Integer or structure type of an object used to represent sets of signals.
CX **pid_t**	As described in **<sys/types.h>**.

RTS The **<signal.h>** header shall define the **sigevent** structure, which has at least the following members:

`int`	`sigev_notify`	Notification type.
`int`	`sigev_signo`	Signal number.
`union sigval`	`sigev_value`	Signal value.
`void(*)(union sigval)`	`sigev_notify_function`	Notification function.
`(pthread_attr_t *)`	`sigev_notify_attributes`	Notification attributes.

The following values of *sigev_notify* shall be defined:

SIGEV_NONE	No asynchronous notification is delivered when the event of interest occurs.
SIGEV_SIGNAL	A queued signal, with an application-defined value, is generated when the event of interest occurs.
SIGEV_THREAD	A notification function is called to perform notification.

The **sigval** union shall be defined as:

`int`	`sival_int`	Integer signal value.
`void`	`*sival_ptr`	Pointer signal value.

This header shall also declare the macros SIGRTMIN and SIGRTMAX, which evaluate to integer expressions, and specify a range of signal numbers that are reserved for application use and for which the realtime signal behavior specified in this volume of IEEE Std 1003.1-200x is supported.

The signal numbers in this range do not overlap any of the signals specified in the following table.

The range SIGRTMIN through SIGRTMAX inclusive shall include at least {RTSIG_MAX} signal numbers.

It is implementation-defined whether realtime signal behavior is supported for other signals.

This header also declares the constants that are used to refer to the signals that occur in the system. Signals defined here begin with the letters SIG. Each of the signals have distinct positive integer values. The value 0 is reserved for use as the null signal (see *kill*()). Additional implementation-defined signals may occur in the system.

CX The ISO C standard only requires the signal names SIGABRT, SIGFPE, SIGILL, SIGINT, SIGSEGV, and SIGTERM to be defined.

The following signals shall be supported on all implementations (default actions are explained below the table):

Signal	Default Action	Description
SIGABRT	A	Process abort signal.
SIGALRM	T	Alarm clock.
SIGBUS	A	Access to an undefined portion of a memory object.
SIGCHLD	I	Child process terminated, stopped, or continued.
SIGCONT	C	Continue executing, if stopped.
SIGFPE	A	Erroneous arithmetic operation.
SIGHUP	T	Hangup.
SIGILL	A	Illegal instruction.
SIGINT	T	Terminal interrupt signal.
SIGKILL	T	Kill (cannot be caught or ignored).
SIGPIPE	T	Write on a pipe with no one to read it.
SIGQUIT	A	Terminal quit signal.
SIGSEGV	A	Invalid memory reference.
SIGSTOP	S	Stop executing (cannot be caught or ignored).
SIGTERM	T	Termination signal.
SIGTSTP	S	Terminal stop signal.
SIGTTIN	S	Background process attempting read.
SIGTTOU	S	Background process attempting write.
SIGUSR1	T	User-defined signal 1.
SIGUSR2	T	User-defined signal 2.
SIGPOLL	T	Pollable event.
SIGPROF	T	Profiling timer expired.
SIGSYS	A	Bad system call.
SIGTRAP	A	Trace/breakpoint trap.
SIGURG	I	High bandwidth data is available at a socket.
SIGVTALRM	T	Virtual timer expired.
SIGXCPU	A	CPU time limit exceeded.
SIGXFSZ	A	File size limit exceeded.

The default actions are as follows:

T Abnormal termination of the process. The process is terminated with all the consequences of *_exit*() except that the status made available to *wait*() and *waitpid*() indicates abnormal termination by the specified signal.

A Abnormal termination of the process.

XSI Additionally, implementation-defined abnormal termination actions, such as creation of a core file, may occur.

I Ignore the signal.

S Stop the process.

C Continue the process, if it is stopped; otherwise, ignore the signal.

CX The header shall provide a declaration of **struct sigaction**, including at least the following members:

`void (*sa_handler)(int)`	What to do on receipt of signal.
`sigset_t sa_mask`	Set of signals to be blocked during execution of the signal handling function.
`int sa_flags`	Special flags.
`void (*)(int, siginfo_t *, void *) sa_sigaction`	Pointer to signal handler function or one of the macros SIG_IGN or SIG_DFL.

XSI The storage occupied by *sa_handler* and *sa_sigaction* may overlap, and a portable program must not use both simultaneously.

The following shall be declared as constants:

CX XSI	SA_NOCLDSTOP	Do not generate SIGCHLD when children stop or stopped children continue.
CX	SIG_BLOCK	The resulting set is the union of the current set and the signal set pointed to by the argument *set*.
CX	SIG_UNBLOCK	The resulting set is the intersection of the current set and the complement of the signal set pointed to by the argument *set*.
CX	SIG_SETMASK	The resulting set is the signal set pointed to by the argument *set*.
XSI	SA_ONSTACK	Causes signal delivery to occur on an alternate stack.
XSI	SA_RESETHAND	Causes signal dispositions to be set to SIG_DFL on entry to signal handlers.
XSI	SA_RESTART	Causes certain functions to become restartable.
XSI	SA_SIGINFO	Causes extra information to be passed to signal handlers at the time of receipt of a signal.
XSI	SA_NOCLDWAIT	Causes implementations not to create zombie processes on child death.
XSI	SA_NODEFER	Causes signal not to be automatically blocked on entry to signal handler.
XSI	SS_ONSTACK	Process is executing on an alternate signal stack.
XSI	SS_DISABLE	Alternate signal stack is disabled.
XSI	MINSIGSTKSZ	Minimum stack size for a signal handler.
XSI	SIGSTKSZ	Default size in bytes for the alternate signal stack.

XSI The **ucontext_t** structure shall be defined through **typedef** as described in **<ucontext.h>**.

The **mcontext_t** type shall be defined through **typedef** as described in **<ucontext.h>**.

The **<signal.h>** header shall define the **stack_t** type as a structure that includes at least the following members:

`void`	`*ss_sp`	Stack base or pointer.
`size_t`	`ss_size`	Stack size.
`int`	`ss_flags`	Flags.

The **<signal.h>** header shall define the **sigstack** structure that includes at least the following members:

`int`	`ss_onstack`	Non-zero when signal stack is in use.
`void`	`*ss_sp`	Signal stack pointer.

CX The **<signal.h>** header shall define the **siginfo_t** type as a structure that includes at least the following members:

CX	`int`	`si_signo`	Signal number.
XSI	`int`	`si_errno`	If non-zero, an *errno* value associated with this signal, as defined in **<errno.h>**.
CX	`int`	`si_code`	Signal code.
XSI	`pid_t`	`si_pid`	Sending process ID.
	`uid_t`	`si_uid`	Real user ID of sending process.
	`void`	`*si_addr`	Address of faulting instruction.
	`int`	`si_status`	Exit value or signal.
	`long`	`si_band`	Band event for SIGPOLL.
RTS	`union sigval`	`si_value`	Signal value.

The macros specified in the **Code** column of the following table are defined for use as values of XSI *si_code* that are signal-specific or non-signal-specific reasons why the signal was generated.

Signal	Code	Reason
XSI SIGILL	ILL_ILLOPC	Illegal opcode.
	ILL_ILLOPN	Illegal operand.
	ILL_ILLADR	Illegal addressing mode.
	ILL_ILLTRP	Illegal trap.
	ILL_PRVOPC	Privileged opcode.
	ILL_PRVREG	Privileged register.
	ILL_COPROC	Coprocessor error.
	ILL_BADSTK	Internal stack error.
SIGFPE	FPE_INTDIV	Integer divide by zero.
	FPE_INTOVF	Integer overflow.
	FPE_FLTDIV	Floating-point divide by zero.
	FPE_FLTOVF	Floating-point overflow.
	FPE_FLTUND	Floating-point underflow.
	FPE_FLTRES	Floating-point inexact result.
	FPE_FLTINV	Invalid floating-point operation.
	FPE_FLTSUB	Subscript out of range.
SIGSEGV	SEGV_MAPERR	Address not mapped to object.
	SEGV_ACCERR	Invalid permissions for mapped object.
SIGBUS	BUS_ADRALN	Invalid address alignment.
	BUS_ADRERR	Non-existent physical address.
	BUS_OBJERR	Object specific hardware error.
SIGTRAP	TRAP_BRKPT	Process breakpoint.
	TRAP_TRACE	Process trace trap.
SIGCHLD	CLD_EXITED	Child has exited.
	CLD_KILLED	Child has terminated abnormally and did not create a core file.
	CLD_DUMPED	Child has terminated abnormally and created a core file.
	CLD_TRAPPED	Traced child has trapped.
	CLD_STOPPED	Child has stopped.
	CLD_CONTINUED	Stopped child has continued.
SIGPOLL	POLL_IN	Data input available.
	POLL_OUT	Output buffers available.
	POLL_MSG	Input message available.
	POLL_ERR	I/O error.
	POLL_PRI	High priority input available.
	POLL_HUP	Device disconnected.
CX Any	SI_USER	Signal sent by *kill*( ).
	SI_QUEUE	Signal sent by the *sigqueue*( ).
	SI_TIMER	Signal generated by expiration of a timer set by *timer_settime*( ).
	SI_ASYNCIO	Signal generated by completion of an asynchronous I/O request.
	SI_MESGQ	Signal generated by arrival of a message on an empty message queue.

XSI Implementations may support additional *si_code* values not included in this list, may generate values included in this list under circumstances other than those described in this list, and may contain extensions or limitations that prevent some values from being generated. Implementations do not generate a different value from the ones described in this list for circumstances described in this list.

In addition, the following signal-specific information shall be available:

Signal	Member	Value
SIGILL SIGFPE	**void * si_addr**	Address of faulting instruction.
SIGSEGV SIGBUS	**void * si_addr**	Address of faulting memory reference.
SIGCHLD	**pid_t si_pid** **int si_status** **uid_t si_uid**	Child process ID. Exit value or signal. Real user ID of the process that sent the signal.
SIGPOLL	**long si_band**	Band event for POLL_IN, POLL_OUT, or POLL_MSG.

For some implementations, the value of *si_addr* may be inaccurate.

The following shall be declared as functions and may also be defined as macros:

```
XSI  void (*bsd_signal(int, void (*)(int)))(int);
CX   int    kill(pid_t, int);
XSI  int    killpg(pid_t, int);
THR  int    pthread_kill(pthread_t, int);
     int    pthread_sigmask(int, const sigset_t *, sigset_t *);
     int    raise(int);
CX   int    sigaction(int, const struct sigaction *restrict,
                struct sigaction *restrict);
     int    sigaddset(sigset_t *, int);
XSI  int    sigaltstack(const stack_t *restrict, stack_t *restrict);
CX   int    sigdelset(sigset_t *, int);
     int    sigemptyset(sigset_t *);
     int    sigfillset(sigset_t *);
XSI  int    sighold(int);
     int    sigignore(int);
     int    siginterrupt(int, int);
CX   int    sigismember(const sigset_t *, int);
     void (*signal(int, void (*)(int)))(int);
XSI  int    sigpause(int);
CX   int    sigpending(sigset_t *);
     int    sigprocmask(int, const sigset_t *restrict, sigset_t *restrict);
RTS  int    sigqueue(pid_t, int, const union sigval);
XSI  int    sigrelse(int);
     void (*sigset(int, void (*)(int)))(int);
CX   int    sigsuspend(const sigset_t *);
RTS  int    sigtimedwait(const sigset_t *restrict, siginfo_t *restrict,
                const struct timespec *restrict);
CX   int    sigwait(const sigset_t *restrict, int *restrict);
RTS  int    sigwaitinfo(const sigset_t *restrict, siginfo_t *restrict);
```

CX Inclusion of the **<signal.h>** header may make visible all symbols from the **<time.h>** header.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<errno.h>, **<stropts.h>**, **<sys/types.h>**, **<time.h>**, **<ucontext.h>**, the System Interfaces volume of IEEE Std 1003.1-200x, *alarm*( ), *bsd_signal*( ), *ioctl*( ), *kill*( ), *killpg*( ), *raise*( ), *sigaction*( ), *sigaddset*( ), *sigaltstack*( ), *sigdelset*( ), *sigemptyset*( ), *sigfillset*( ), *siginterrupt*( ), *sigismember*( ), *signal*( ), *sigpending*( ), *sigprocmask*( ), *sigqueue*( ), *sigsuspend*( ), *sigwaitinfo*( ), *wait*( ), *waitid*( )

CHANGE HISTORY

First released in Issue 1.

Issue 5

The DESCRIPTION is updated for alignment with POSIX Realtime Extension and the POSIX Threads Extension.

The default action for SIGURG is changed for i to iii. The function prototype for *sigmask*( ) is removed.

Issue 6

The Open Group Corrigendum U035/2 is applied. In the DESCRIPTION, the wording for abnormal termination is clarified.

The Open Group Corrigendum U028/8 is applied, correcting the prototype for the *sigset*( ) function.

The Open Group Corrigendum U026/3 is applied, correcting the type of the *sigev_notify_function* function member of the **sigevent** structure.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The SIGCHLD, SIGCONT, SIGSTOP, SIGTSTP, SIGTTIN, and SIGTTOU signals are now mandated. This is also a FIPS requirement.
- The **pid_t** definition is mandated.

The RT markings are now changed to RTS to denote that the semantics are part of the Realtime Signals Extension option.

The **restrict** keyword is added to the prototypes for *sigaction*( ), *sigaltstack*( ), *sigprocmask*( ), *sigtimedwait*( ), *sigwait*( ), and *sigwaitinfo*( ).

IEEE PASC Interpretation 1003.1 #85 is applied, adding the statement that symbols from **<time.h>** may be made visible when **<signal.h>** is included. Extensions beyond the ISO C standard are now marked.

NAME

spawn.h — spawn (**ADVANCED REALTIME**)

SYNOPSIS

SPN `#include <spawn.h>`

DESCRIPTION

The **<spawn.h>** header shall define the **posix_spawnattr_t** and **posix_spawn_file_actions_t** types used in performing spawn operations.

The **<spawn.h>** header shall define the flags that may be set in a **posix_spawnattr_t** object using the *posix_spawnattr_setflags*( ) function:

POSIX_SPAWN_RESETIDS
POSIX_SPAWN_SETPGROUP
PS POSIX_SPAWN_SETSCHEDPARAM
POSIX_SPAWN_SETSCHEDULER
POSIX_SPAWN_SETSIGDEF
POSIX_SPAWN_SETSIGMASK

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int   posix_spawn(pid_t *restrict, const char *restrict,
          const posix_spawn_file_actions_t *,
          const posix_spawnattr_t *restrict, char *const [restrict],
          char *const [restrict]);
int   posix_spawn_file_actions_addclose(posix_spawn_file_actions_t *,
          int);
int   posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t *,
          int, int);
int   posix_spawn_file_actions_addopen(posix_spawn_file_actions_t *restrict,
          int, const char *restrict, int, mode_t);
int   posix_spawn_file_actions_destroy(posix_spawn_file_actions_t *);
int   posix_spawn_file_actions_init(posix_spawn_file_actions_t *);
int   posix_spawnattr_destroy(posix_spawnattr_t *);
int   posix_spawnattr_getsigdefault(const posix_spawnattr_t *restrict,
          sigset_t *restrict);
int   posix_spawnattr_getflags(const posix_spawnattr_t *restrict,
          short *restrict);
int   posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict,
          pid_t *restrict);
int   posix_spawnattr_getschedparam(const posix_spawnattr_t *restrict,
          struct sched_param *restrict);
int   posix_spawnattr_getschedpolicy(const posix_spawnattr_t *restrict,
          int *restrict);
int   posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict,
          sigset_t *restrict);
int   posix_spawnattr_init(posix_spawnattr_t *);
int   posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict,
          const sigset_t *restrict);
int   posix_spawnattr_setflags(posix_spawnattr_t *, short);
int   posix_spawnattr_setpgroup(posix_spawnattr_t *, pid_t);
```

```
int   posix_spawnattr_setschedparam(posix_spawnattr_t *restrict,
          const struct sched_param *restrict);
int   posix_spawnattr_setschedpolicy(posix_spawnattr_t *, int);
int   posix_spawnattr_setsigmask(posix_spawnattr_t *restrict,
          const sigset_t *restrict);
int   posix_spawnp(pid_t *restrict, const char *restrict,
          const posix_spawn_file_actions_t *,
          const posix_spawnattr_t *restrict,
          char *const [restrict], char *const [restrict]);
```

Inclusion of the **<spawn.h>** header may make visible symbols defined in the **<sched.h>**, **<signal.h>**, and **<sys/types.h>** headers.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Included for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the prototypes for *posix_spawn*( ), *posix_spawn_file_actions_addopen*( ), *posix_spawnattr_getsigdefault*( ), *posix_spawnattr_getflags*( ), *posix_spawnattr_getpgroup*( ), *posix_spawnattr_getschedparam*( ), *posix_spawnattr_getschedpolicy*( ), *posix_spawnattr_getsigmask*( ), *posix_spawnattr_setsigdefault*( ), *posix_spawnattr_setschedparam*( ), *posix_spawnattr_setsigmask*( ), and *posix_spawnp*( ).

NAME

stdarg.h — handle variable argument list

SYNOPSIS

```
#include <stdarg.h>

void va_start(va_list ap, argN);
void va_copy(va_list dest, va_list src);
type va_arg(va_list ap, type);
void va_end(va_list ap);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The **<stdarg.h>** header shall contain a set of macros which allows portable functions that accept variable argument lists to be written. Functions that have variable argument lists (such as *printf*( )) but do not use these macros, are inherently non-portable, as different systems use different argument-passing conventions.

The type **va_list** shall be defined for variables used to traverse the list.

The *va_start*( ) macro is invoked to initialize *ap* to the beginning of the list before any calls to *va_arg*( ).

The *va_copy*( ) macro initializes as a copy of *src*, as if the *va_start*( ) macro had been applied to *dest* followed by the same sequence of uses of the *va_arg*( ) macro as had previously been used to reach the present state of *src*. Neither the *va_copy*( ) nor *va_start*( ) macro shall be invoked to reinitialize *dest* without an intervening invocation of the *va_end*( ) macro for the same *dest*.

The object *ap* may be passed as an argument to another function; if that function invokes the *va_arg*( ) macro with parameter *ap*, the value of *ap* in the calling function is unspecified and shall be passed to the *va_end*( ) macro prior to any further reference to *ap*. The parameter *argN* is the identifier of the rightmost parameter in the variable parameter list in the function definition (the one just before the ...). If the parameter *argN* is declared with the **register** storage class, with a function type or array type, or with a type that is not compatible with the type that results after application of the default argument promotions, the behavior is undefined.

The *va_arg*( ) macro shall return the next argument in the list pointed to by *ap*. Each invocation of *va_arg*( ) modifies *ap* so that the values of successive arguments are returned in turn. The *type* parameter is the type the argument is expected to be. This is the type name specified such that the type of a pointer to an object that has the specified type can be obtained simply by suffixing a `'*'` to type. Different types can be mixed, but it is up to the routine to know what type of argument is expected.

The *va_end*( ) macro is used to clean up; it invalidates *ap* for use (unless *va_start*( ) or *va_copy*( ) is invoked again).

Each invocation of the *va_start*( ) and *va_copy*( ) macros shall be matched by a corresponding invocation of the *va_end*( ) macro in the same function.

Multiple traversals, each bracketed by *va_start*( ) ... *va_end*( ), are possible.

EXAMPLES

This example is a possible implementation of *execl*( ):

```
#include <stdarg.h>
```

```
#define  MAXARGS     31

/*
 * execl is called by
 * execl(file, arg1, arg2, ..., (char *)(0));
 */
int execl(const char *file, const char *args, ...)
{
    va_list ap;
    char *array[MAXARGS];
    int argno = 0;
        va_start(ap, args);
    while (args != 0) {
        array[argno++] = args;
        args = va_arg(ap, const char *);
}
va_end(ap);
return execv(file, array);
}
```

APPLICATION USAGE

It is up to the calling routine to communicate to the called routine how many arguments there are, since it is not always possible for the called routine to determine this in any other way. For example, *execl*( ) is passed a null pointer to signal the end of the list. The *printf*( ) function can tell how many arguments are there by the *format* argument.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

stdbool.h — boolean type and values

SYNOPSIS

```
#include <stdbool.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The **<stdbool.h>** header shall define the following macros:

bool	Expands to **_Bool**.
true	Expands to the integer constant 1.
false	Expands to the integer constant 0.
__bool_true_false_are_defined	Expands to the integer constant 1.

An application may undefine and then possibly redefine the macros bool, true, and false.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The ability to undefine and redefine the macros bool, true, and false is an obsolescent feature and may be withdrawn in the future.

SEE ALSO

None.

CHANGE HISTORY

First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

NAME

stddef.h — standard type definitions

SYNOPSIS

`#include <stddef.h>`

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The **<stddef.h>** header shall define the following macros:

NULL	Null pointer constant.
offsetof(*type*, *member-designator*)	Integer constant expression of type **size_t**, the value of which is the offset in bytes to the structure member (*member-designator*), from the beginning of its structure (*type*).

The **<stddef.h>** header shall define the following types:

ptrdiff_t	Signed integer type of the result of subtracting two pointers.
wchar_t	Integer type whose range of values can represent distinct wide-character codes for all members of the largest character set specified among the locales supported by the compilation environment: the null character has the code value 0 and each member of the portable character set has a code value equal to its value when used as the lone character in an integer character constant.
size_t	Unsigned integer type of the result of the *sizeof* operator.

The implementation shall support one or more programming environments in which the widths of **ptrdiff_t**, **size_t**, and **wchar_t** are no greater than the width of type **long**. The names of these programming environments can be obtained using the *confstr*( ) function or the *getconf* utility.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the ANSI C standard.

NAME

stdint.h — integer types

SYNOPSIS

```
#include <stdint.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of these symbols in this header.

The **<stdint.h>** header shall declare sets of integer types having specified widths, and shall define corresponding sets of macros. It shall also define macros that specify limits of integer types corresponding to types defined in other standard headers.

Note: The ‘‘width’’ of an integer type is the number of bits used to store its value in a pure binary system; the actual type may use more bits than that (for example, a 28-bit type could be stored in 32 bits of actual storage). An N-bit signed type has values in the range -2^{N-1} or $1-2^{N-1}$ to $2^{N-1}-1$, while an N-bit unsigned type has values in the range 0 to $2^{N}-1$.

Types are defined in the following categories:

- Integer types having certain exact widths
- Integer types having at least certain specified widths
- Fastest integer types having at least certain specified widths
- Integer types wide enough to hold pointers to objects
- Integer types having greatest width

(Some of these types may denote the same type.)

Corresponding macros specify limits of the declared types and construct suitable constants.

For each type described herein that the implementation provides, the **<stdint.h>** header shall declare that **typedef** name and define the associated macros. Conversely, for each type described herein that the implementation does not provide, the **<stdint.h>** header shall not declare that **typedef** name, nor shall it define the associated macros. An implementation shall provide those types described as required, but need not provide any of the others (described as optional).

Integer Types

When **typedef** names differing only in the absence or presence of the initial *u* are defined, they shall denote corresponding signed and unsigned types as described in the ISO/IEC 9899:1999 standard, Section 6.2.5; an implementation providing one of these corresponding types shall also provide the other.

In the following descriptions, the symbol N represents an unsigned decimal integer with no leading zeros (for example, 8 or 24, but not 04 or 048).

- Exact-width integer types

  The **typedef** name **int*N*_t** designates a signed integer type with width N, no padding bits, and a two’s-complement representation. Thus, **int8_t** denotes a signed integer type with a width of exactly 8 bits.

  The **typedef** name **uint*N*_t** designates an unsigned integer type with width N. Thus, **uint24_t** denotes an unsigned integer type with a width of exactly 24 bits.

CX The following types are required:

int8_t
int16_t
int32_t
uint8_t
uint16_t
uint32_t

If an implementation provides integer types with width 64 that meet these requirements, then the following types are required:

int64_t
uint64_t

CX In particular, this will be the case if any of the following are true:

— The implementation supports the _POSIX_V6_ILP32_OFFBIG programming environment and the application is being built in the _POSIX_V6_ILP32_OFFBIG programming environment (see the Shell and Utilities volume of IEEE Std 1003.1-200x, *c99*, Programming Environments).

— The implementation supports the _POSIX_V6_LP64_OFF64 programming environment and the application is being built in the _POSIX_V6_LP64_OFF64 programming environment.

— The implementation supports the _POSIX_V6_LPBIG_OFFBIG programming environment and the application is being built in the _POSIX_V6_LPBIG_OFFBIG programming environment.

All other types are of this form optional.

- Minimum-width integer types

The **typedef** name **int_least***N***_t** designates a signed integer type with a width of at least *N*, such that no signed integer type with lesser size has at least the specified width. Thus, **int_least32_t** denotes a signed integer type with a width of at least 32 bits.

The **typedef** name **uint_least***N***_t** designates an unsigned integer type with a width of at least *N*, such that no unsigned integer type with lesser size has at least the specified width. Thus, **uint_least16_t** denotes an unsigned integer type with a width of at least 16 bits.

The following types are required:

int_least8_t
int_least16_t
int_least32_t
int_least64_t
uint_least8_t
uint_least16_t
uint_least32_t
uint_least64_t

All other types of this form are optional.

- Fastest minimum-width integer types

Each of the following types designates an integer type that is usually fastest to operate with among all integer types that have at least the specified width.

The designated type is not guaranteed to be fastest for all purposes; if the implementation has no clear grounds for choosing one type over another, it will simply pick some integer type satisfying the signedness and width requirements.

The **typedef** name **int_fast***N***_t** designates the fastest signed integer type with a width of at least *N*. The **typedef** name **uint_fast***N***_t** designates the fastest unsigned integer type with a width of at least *N*.

The following types are required:

int_fast8_t
int_fast16_t
int_fast32_t
int_fast64_t
uint_fast8_t
uint_fast16_t
uint_fast32_t
uint_fast64_t

All other types of this form are optional.

- Integer types capable of holding object pointers

The following type designates a signed integer type with the property that any valid pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and the result will compare equal to the original pointer:

intptr_t

The following type designates an unsigned integer type with the property that any valid pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and the result will compare equal to the original pointer:

uintptr_t

XSI On XSI-conformant systems, the **intptr_t** and **uintptr_t** types are required;otherwise, they are optional.

- Greatest-width integer types

The following type designates a signed integer type capable of representing any value of any signed integer type:

intmax_t

The following type designates an unsigned integer type capable of representing any value of any unsigned integer type:

uintmax_t

These types are required.

Note: Applications can test for optional types by using the corresponding limit macro from **Limits of Specified-Width Integer Types** (on page 316).

Limits of Specified-Width Integer Types

The following macros specify the minimum and maximum limits of the types declared in the **<stdint.h>** header. Each macro name corresponds to a similar type name in **Integer Types** (on page 313).

Each instance of any defined macro shall be replaced by a constant expression suitable for use in **#if** preprocessing directives, and this expression shall have the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. Its implementation-defined value shall be equal to or greater in magnitude (absolute value) than the corresponding value given below, with the same sign, except where stated to be exactly the given value.

- Limits of exact-width integer types
  - Minimum values of exact-width signed integer types:

    {INT*N*_MIN} Exactly $-(2^{N-1})$
  - Maximum values of exact-width signed integer types:

    {INT*N*_MAX} Exactly $2^{N-1}-1$
  - Maximum values of exact-width unsigned integer types:

    {UINT*N*_MAX} Exactly $2^{N}-1$
- Limits of minimum-width integer types
  - Minimum values of minimum-width signed integer types:

    {INT_LEAST*N*_MIN} $-(2^{N-1}-1)$
  - Maximum values of minimum-width signed integer types:

    {INT_LEAST*N*_MAX} $2^{N-1}-1$
  - Maximum values of minimum-width unsigned integer types:

    {UINT_LEAST*N*_MAX} $2^{N}-1$
- Limits of fastest minimum-width integer types
  - Minimum values of fastest minimum-width signed integer types:

    {INT_FAST*N*_MIN} $-(2^{N-1}-1)$
  - Maximum values of fastest minimum-width signed integer types:

    {INT_FAST*N*_MAX} $2^{N-1}-1$
  - Maximum values of fastest minimum-width unsigned integer types:

    {UINT_FAST*N*_MAX} $2^{N}-1$
- Limits of integer types capable of holding object pointers
  - Minimum value of pointer-holding signed integer type:

    {INTPTR_MIN} $-(2^{15}-1)$
  - Maximum value of pointer-holding signed integer type:

    {INTPTR_MAX} $2^{15}-1$
  - Maximum value of pointer-holding unsigned integer type:

{UINTPTR_MAX}	$2^{16} - 1$

- Limits of greatest-width integer types
  - Minimum value of greatest-width signed integer type:

    {INTMAX_MIN} $-(2^{63} - 1)$
  - Maximum value of greatest-width signed integer type:

    {INTMAX_MAX} $2^{63} - 1$
  - Maximum value of greatest-width unsigned integer type:

    {UINTMAX_MAX} $2^{64} - 1$

Limits of Other Integer Types

The following macros specify the minimum and maximum limits of integer types corresponding to types defined in other standard headers.

Each instance of these macros shall be replaced by a constant expression suitable for use in **#if** preprocessing directives, and this expression shall have the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. Its implementation-defined value shall be equal to or greater in magnitude (absolute value) than the corresponding value given below, with the same sign.

- Limits of **ptrdiff_t**:

{PTRDIFF_MIN}	–65535
{PTRDIFF_MAX}	+65535

- Limits of **sig_atomic_t**:

{SIG_ATOMIC_MIN}	See below.
{SIG_ATOMIC_MAX}	See below.

- Limit of **size_t**:

{SIZE_MAX}	65535

- Limits of **wchar_t**:

{WCHAR_MIN}	See below.
{WCHAR_MAX}	See below.

- Limits of **wint_t**:

{WINT_MIN}	See below.
{WINT_MAX}	See below.

If **sig_atomic_t** (see the **<signal.h>** header) is defined as a signed integer type, the value of {SIG_ATOMIC_MIN} shall be no greater than –127 and the value of {SIG_ATOMIC_MAX} shall be no less than 127; otherwise, **sig_atomic_t** shall be defined as an unsigned integer type, and the value of {SIG_ATOMIC_MIN} shall be 0 and the value of {SIG_ATOMIC_MAX} shall be no less than 255.

If **wchar_t** (see the **<stddef.h>** header) is defined as a signed integer type, the value of {WCHAR_MIN} shall be no greater than –127 and the value of {WCHAR_MAX} shall be no less than 127; otherwise, **wchar_t** shall be defined as an unsigned integer type, and the value of {WCHAR_MIN} shall be 0 and the value of {WCHAR_MAX} shall be no less than 255.

If **wint_t** (see the **<wchar.h>** header) is defined as a signed integer type, the value of {WINT_MIN} shall be no greater than −32767 and the value of {WINT_MAX} shall be no less than 32767; otherwise, **wint_t** shall be defined as an unsigned integer type, and the value of {WINT_MIN} shall be 0 and the value of {WINT_MAX} shall be no less than 65535.

Macros for Integer Constant Expressions

The following macros expand to integer constant expressions suitable for initializing objects that have integer types corresponding to types defined in the **<stdint.h>** header. Each macro name corresponds to a similar type name listed under *Minimum-width integer types* and *Greatest-width integer types*.

Each invocation of one of these macros shall expand to an integer constant expression suitable for use in **#if** preprocessing directives. The type of the expression shall have the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. The value of the expression shall be that of the argument.

The argument in any instance of these macros shall be a decimal, octal, or hexadecimal constant with a value that does not exceed the limits for the corresponding type.

- Macros for minimum-width integer constant expressions

  The macro *INTN_C*(*value*) shall expand to an integer constant expression corresponding to the type **int_least***N***_t**. The macro *UINTN_C*(*value*) shall expand to an integer constant expression corresponding to the type **uint_least***N***_t**. For example, if **uint_least64_t** is a name for the type **unsigned long long**, then *UINT64_C*(0x123) might expand to the integer constant 0x123ULL.

- Macros for greatest-width integer constant expressions

  The following macro expands to an integer constant expression having the value specified by its argument and the type **intmax_t**:

  INTMAX_C(*value*)

  The following macro expands to an integer constant expression having the value specified by its argument and the type **uintmax_t**:

  UINTMAX_C(*value*)

APPLICATION USAGE

None.

RATIONALE

The **<stdint.h>** header is a subset of the **<inttypes.h>** header more suitable for use in freestanding environments, which might not support the formatted I/O functions. In some environments, if the formatted conversion support is not wanted, using this header instead of the **<inttypes.h>** header avoids defining such a large number of macros.

As a consequence of adding **int8_t** the following are true:

- A byte is exactly 8 bits.
- {CHAR_BIT} has the value 8, {SCHAR_MAX} has the value 127, {SCHAR_MIN} has the value −127 or −128, and {UCHAR_MAX} has the value 255.

FUTURE DIRECTIONS

typedef names beginning with **int** or **uint** and ending with _t may be added to the types defined in the **<stdint.h>** header. Macro names beginning with INT or UINT and ending with _MAX, _MIN, or _C may be added to the macros defined in the **<stdint.h>** header.

ISO / IEC 9899: 1999 standard, Technical Corrigendum No. 1 is incorporated. |

NAME

stdio.h — standard buffered input/output

SYNOPSIS

```
#include <stdio.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of these symbols in this header.

The **<stdio.h>** header shall define the following macros as positive integer constant expressions:

BUFSIZ	Size of **<stdio.h>** buffers.
_IOFBF	Input/output fully buffered.
_IOLBF	Input/output line buffered.
_IONBF	Input/output unbuffered.
CX L_ctermid	Maximum size of character array to hold *ctermid*( ) output.
L_tmpnam	Maximum size of character array to hold *tmpnam*( ) output.
SEEK_CUR	Seek relative to current position.
SEEK_END	Seek relative to end-of-file.
SEEK_SET	Seek relative to start-of-file.

The following macros shall be defined as positive integer constant expressions which denote implementation limits:

{FILENAME_MAX}	Maximum size in bytes of the longest filename string that the implementation guarantees can be opened.
{FOPEN_MAX}	Number of streams which the implementation guarantees can be open simultaneously. The value is at least eight.
{TMP_MAX}	Minimum number of unique filenames generated by *tmpnam*( ). Maximum number of times an application can call *tmpnam*( ) reliably. The value of {TMP_MAX} is at least 25. XSI On XSI-conformant systems, the value of {TMP_MAX} is at least 10,000.

The following macro name shall be defined as a negative integer constant expression:

EOF	End-of-file return value.

The following macro name shall be defined as a null pointer constant:

NULL	Null pointer.

The following macro name shall be defined as a string constant:

XSI P_tmpdir	Default directory prefix for *tempnam*( ).

The following shall be defined as expressions of type ‘‘pointer to **FILE**’’ that point to the **FILE** objects associated, respectively, with the standard error, input, and output streams:

stderr	Standard error output stream.
stdin	Standard input stream.

stdout	Standard output stream.

The following data types shall be defined through **typedef**:

FILE	A structure containing information about a file.
fpos_t	A non-array type containing all information needed to specify uniquely every position within a file.
va_list	As described in **<stdarg.h>**.
size_t	As described in **<stddef.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
void     clearerr(FILE *);
char    *ctermid(char *);
int      fclose(FILE *);
FILE    *fdopen(int, const char *);
int      feof(FILE *);
int      ferror(FILE *);
int      fflush(FILE *);
int      fgetc(FILE *);
int      fgetpos(FILE *restrict, fpos_t *restrict);
char    *fgets(char *restrict, int, FILE *restrict);
int      fileno(FILE *);
void     flockfile(FILE *);
FILE    *fopen(const char *restrict, const char *restrict);
int      fprintf(FILE *restrict, const char *restrict, ...);
int      fputc(int, FILE *);
int      fputs(const char *restrict, FILE *restrict);
size_t   fread(void *restrict, size_t, size_t, FILE *restrict);
FILE    *freopen(const char *restrict, const char *restrict,
             FILE *restrict);
int      fscanf(FILE *restrict, const char *restrict, ...);
int      fseek(FILE *, long, int);
int      fseeko(FILE *, off_t, int);
int      fsetpos(FILE *, const fpos_t *);
long     ftell(FILE *);
off_t    ftello(FILE *);
int      ftrylockfile(FILE *);
void     funlockfile(FILE *);
size_t   fwrite(const void *restrict, size_t, size_t, FILE *restrict);
int      getc(FILE *);
int      getchar(void);
int      getc_unlocked(FILE *);
int      getchar_unlocked(void);
char    *gets(char *);
int      pclose(FILE *);
void     perror(const char *);
FILE    *popen(const char *, const char *);
int      printf(const char *restrict, ...);
int      putc(int, FILE *);
int      putchar(int);
```

```
int      putc_unlocked(int, FILE *);
int      putchar_unlocked(int);
int      puts(const char *);
int      remove(const char *);
int      rename(const char *, const char *);
void     rewind(FILE *);
int      scanf(const char *restrict, ...);
void     setbuf(FILE *restrict, char *restrict);
int      setvbuf(FILE *restrict, char *restrict, int, size_t);
int      snprintf(char *restrict, size_t, const char *restrict, ...);
int      sprintf(char *restrict, const char *restrict, ...);
int      sscanf(const char *restrict, const char *restrict, int ...);
char    *tempnam(const char *, const char *);
FILE    *tmpfile(void);
char    *tmpnam(char *);
int      ungetc(int, FILE *);
int      vfprintf(FILE *restrict, const char *restrict, va_list);
int      vfscanf(FILE *restrict, const char *restrict, va_list);
int      vprintf(const char *restrict, va_list);
int      vscanf(const char *restrict, va_list);
int      vsnprintf(char *restrict, size_t, const char *restrict, va_list;
int      vsprintf(char *restrict, const char *restrict, va_list);
int      vsscanf(const char *restrict, const char *restrict, va_list arg);
```

XSI Inclusion of the **<stdio.h>** header may also make visible all symbols from **<stddef.h>**.

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Large File System extensions are added.

The constant L_cuserid and the external variables *optarg*, *opterr*, *optind*, and *optopt* are marked as extensions and LEGACY.

The *cuserid*( ) and *getopt*( ) functions are marked LEGACY.

Issue 6

The constant L_cuserid and the external variables *optarg*, *opterr*, *optind*, and *optopt* are removed as they were previously marked LEGACY.

The *cuserid*( ), *getopt*( ), and *getw*( ) functions are removed as they were previously marked LEGACY.

Several functions are marked as part of the _POSIX_THREAD_SAFE_FUNCTIONS option.

This reference page is updated to align with the ISO/IEC 9899:1999 standard. Note that the description of the **fpos_t** type is now explicitly updated to exclude array types.

Extensions beyond the ISO C standard are now marked.

NAME

stdlib.h — standard library definitions

SYNOPSIS

```
#include <stdlib.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of these symbols in this header.

The **<stdlib.h>** header shall define the following macros:

EXIT_FAILURE	Unsuccessful termination for *exit*( ); evaluates to a non-zero value.
EXIT_SUCCESS	Successful termination for *exit*( ); evaluates to 0.
NULL	Null pointer.
{RAND_MAX}	Maximum value returned by *rand*( ); at least 32,767.
{MB_CUR_MAX}	Integer expression whose value is the maximum number of bytes in a character specified by the current locale.

The following data types shall be defined through **typedef**:

div_t	Structure type returned by the *div*( ) function.
ldiv_t	Structure type returned by the *ldiv*( ) function.
lldiv_t	Structure type returned by the *lldiv*( ) function.
size_t	As described in **<stddef.h>**.
wchar_t	As described in **<stddef.h>**.

In addition, the following symbolic names and macros shall be defined as in **<sys/wait.h>**, for use in decoding the return value from *system*( ):

XSI

WNOHANG
WUNTRACED
WEXITSTATUS
WIFEXITED
WIFSIGNALED
WIFSTOPPED
WSTOPSIG
WTERMSIG

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
void          _Exit(int);
long          a64l(const char *);
void          abort(void);
int           abs(int);
int           atexit(void (*)(void));
double        atof(const char *);
int           atoi(const char *);
long          atol(const char *);
```

```
     long long     atoll(const char *);
     void         *bsearch(const void *, const void *, size_t, size_t,
                       int (*)(const void *, const void *));
     void         *calloc(size_t, size_t);
     div_t         div(int, int);
XSI  double        drand48(void);
     char         *ecvt(double, int, int *restrict, int *restrict); (LEGACY)
     double        erand48(unsigned short[3]);
     void          exit(int);
XSI  char         *fcvt(double, int, int *restrict, int *restrict); (LEGACY)
     void          free(void *);
XSI  char         *gcvt(double, int, char *); (LEGACY)
     char         *getenv(const char *);
XSI  int           getsubopt(char **, char *const *, char **);
     int           grantpt(int);
     char         *initstate(unsigned, char *, size_t);
     long          jrand48(unsigned short[3]);
     char         *l64a(long);
     long          labs(long);
XSI  void          lcong48(unsigned short[7]);
     ldiv_t        ldiv(long, long);
     long long     llabs(long long);
     lldiv_t       lldiv(long long, long long);
XSI  long          lrand48(void);
     void         *malloc(size_t);
     int           mblen(const char *, size_t);
     size_t        mbstowcs(wchar_t *restrict, const char *restrict, size_t);
     int           mbtowc(wchar_t *restrict, const char *restrict, size_t);
XSI  char         *mktemp(char *); (LEGACY)
     int           mkstemp(char *);
     long          mrand48(void);
     long          nrand48(unsigned short[3]);
ADV  int           posix_memalign(void **, size_t, size_t);
XSI  int           posix_openpt(int);
     char         *ptsname(int);
     int           putenv(char *);
     void          qsort(void *, size_t, size_t, int (*)(const void *,
                       const void *));
     int           rand(void);
TSF  int           rand_r(unsigned *);
XSI  long          random(void);
     void         *realloc(void *, size_t);
XSI  char         *realpath(const char *restrict, char *restrict);
     unsigned short seed48(unsigned short[3]);
CX   int           setenv(const char *, const char *, int);
XSI  void          setkey(const char *);
     char         *setstate(const char *);
     void          srand(unsigned);
XSI  void          srand48(long);
     void          srandom(unsigned);
     double        strtod(const char *restrict, char **restrict);
     float         strtof(const char *restrict, char **restrict);
```

```
    long          strtol(const char *restrict, char **restrict, int);
    long double   strtold(const char *restrict, char **restrict);
    long long     strtoll(const char *restrict, char **restrict, int);
    unsigned long strtoul(const char *restrict, char **restrict, int);
    long long     strtoull(const char *restrict, char **restrict, int);
    int           system(const char *);
XSI int           unlockpt(int);
CX  int           unsetenv(const char *);
    size_t        wcstombs(char *restrict, const wchar_t *restrict, size_t);
    int           wctomb(char *, wchar_t);
```

XSI Inclusion of the **<stdlib.h>** header may also make visible all symbols from **<stddef.h>**, **<limits.h>**, **<math.h>**, and **<sys/wait.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

The *ttyslot*( ) and *valloc*( ) functions are marked LEGACY.

The type of the third argument to *initstate*( ) is changed from **int** to **size_t**. The type of the return value from *setstate*( ) is changed from **char** to **char ***, and the type of the first argument is changed from **char *** to **const char ***.

Issue 6

The Open Group Corrigendum U021/1 is applied, correcting the prototype for *realpath*( ) to be consistent with the reference page.

The Open Group Corrigendum U028/13 is applied, correcting the prototype for *putenv*( ) to be consistent with the reference page.

The *rand_r*( ) function is marked as part of the _POSIX_THREAD_SAFE_FUNCTIONS option.

Function prototypes for *setenv*( ) and *unsetenv*( ) are added.

The *posix_memalign*( ) function is added for alignment with IEEE Std 1003.1d-1999.

This reference page is updated to align with the ISO/IEC 9899:1999 standard.

The *ecvt*( ), *fcvt*( ), *gcvt*( ), and *mktemp*( ) functions are marked LEGACY.

The *ttyslot*( ) and *valloc*( ) functions are removed as they were previously marked LEGACY.

Extensions beyond the ISO C standard are now marked.

NAME

string.h — string operations

SYNOPSIS

```
#include <string.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of these symbols in this header.

The **<string.h>** header shall define the following:

NULL	Null pointer constant.
size_t	As described in **<stddef.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided. |

```
XSI void    *memccpy(void *restrict, const void *restrict, int, size_t);
    void    *memchr(const void *, int, size_t);
    int      memcmp(const void *, const void *, size_t);
    void    *memcpy(void *restrict, const void *restrict, size_t);
    void    *memmove(void *, const void *, size_t);
    void    *memset(void *, int, size_t);
    char    *strcat(char *restrict, const char *restrict);
    char    *strchr(const char *, int);
    int      strcmp(const char *, const char *);
    int      strcoll(const char *, const char *);
    char    *strcpy(char *restrict, const char *restrict);
    size_t   strcspn(const char *, const char *);
XSI char    *strdup(const char *);
    char    *strerror(int);
    size_t   strlen(const char *);
    char    *strncat(char *restrict, const char *restrict, size_t);
    int      strncmp(const char *, const char *, size_t);
    char    *strncpy(char *restrict, const char *restrict, size_t);
    char    *strpbrk(const char *, const char *);
    char    *strrchr(const char *, int);
    size_t   strspn(const char *, const char *);
    char    *strstr(const char *, const char *);
    char    *strtok(char *restrict, const char *restrict);
TSF char    *strtok_r(char *, const char *, char **);
    size_t   strxfrm(char *restrict, const char *restrict, size_t);
```

XSI Inclusion of the **<string.h>** header may also make visible all symbols from **<stddef.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The *strtok_r*( ) function is marked as part of the _POSIX_THREAD_SAFE_FUNCTIONS option.

This reference page is updated to align with the ISO / IEC 9899: 1999 standard.

NAME

strings.h — string operations

SYNOPSIS

XSI

```
#include <strings.h>
```

DESCRIPTION

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int    bcmp(const void *, const void *, size_t); (LEGACY)
void   bcopy(const void *, void *, size_t); (LEGACY)
void   bzero(void *, size_t); (LEGACY)
int    ffs(int);
char  *index(const char *, int); (LEGACY)
char  *rindex(const char *, int); (LEGACY)
int    strcasecmp(const char *, const char *);
int    strncasecmp(const char *, const char *, size_t);
```

The **size_t** type shall be defined through **typedef** as described in **<stddef.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<stddef.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *ffs*( ), *strcasecmp*( ), *strncasecmp*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 6

The Open Group Corrigendum U021/2 is applied, correcting the prototype for *index*( ) to be consistent with the reference page.

The *bcmp*( ), *bcopy*( ), *bzero*( ), *index*( ), and *rindex*( ) functions are marked LEGACY.

NAME

stropts.h — STREAMS interface (**STREAMS**)

SYNOPSIS

XSR

```
#include <stropts.h>
```

DESCRIPTION

The **<stropts.h>** header shall define the **bandinfo** structure that includes at least the following members:

`unsigned char`	`bi_pri`	Priority band.
`int`	`bi_flag`	Flushing type.

The **<stropts.h>** header shall define the **strpeek** structure that includes at least the following members:

`struct strbuf`	`ctlbuf`	The control portion of the message.
`struct strbuf`	`databuf`	The data portion of the message.
`t_uscalar_t`	`flags`	RS_HIPRI or 0.

The **<stropts.h>** header shall define the **strbuf** structure that includes at least the following members:

`int`	`maxlen`	Maximum buffer length.
`int`	`len`	Length of data.
`char`	`*buf`	Pointer to buffer.

The **<stropts.h>** header shall define the **strfdinsert** structure that includes at least the following members:

`struct strbuf`	`ctlbuf`	The control portion of the message.
`struct strbuf`	`databuf`	The data portion of the message.
`t_uscalar_t`	`flags`	RS_HIPRI or 0.
`int`	`fildes`	File descriptor of the other STREAM.
`int`	`offset`	Relative location of the stored value.

The **<stropts.h>** header shall define the **strioctl** structure that includes at least the following members:

`int`	`ic_cmd`	*ioctl*( ) command.
`int`	`ic_timout`	Timeout for response.
`int`	`ic_len`	Length of data.
`char`	`*ic_dp`	Pointer to buffer.

The **<stropts.h>** header shall define the **strrecvfd** structure that includes at least the following members:

`int`	`fda`	Received file descriptor.
`uid_t`	`uid`	UID of sender.
`gid_t`	`gid`	GID of sender.

The **uid_t** and **gid_t** types shall be defined through **typedef** as described in **<sys/types.h>**.

The **<stropts.h>** header shall define the **t_scalar_t** and **t_uscalar_t** types respectively as signed and unsigned opaque types of equal length of at least 32 bits.

The **<stropts.h>** header shall define the **str_list** structure that includes at least the following members:

`int`	`sl_nmods`	Number of STREAMS module names.
`struct str_mlist`	`*sl_modlist`	STREAMS module names.

The **<stropts.h>** header shall define the **str_mlist** structure that includes at least the following member:

`char`	`l_name[FMNAMESZ+1]`	A STREAMS module name.

At least the following macros shall be defined for use as the *request* argument to *ioctl*( ):

I_PUSH	Push a STREAMS module.
I_POP	Pop a STREAMS module.
I_LOOK	Get the top module name.
I_FLUSH	Flush a STREAM.
I_FLUSHBAND	Flush one band of a STREAM.
I_SETSIG	Ask for notification signals.
I_GETSIG	Retrieve current notification signals.
I_FIND	Look for a STREAMS module.
I_PEEK	Peek at the top message on a STREAM.
I_SRDOPT	Set the read mode.
I_GRDOPT	Get the read mode.
I_NREAD	Size the top message.
I_FDINSERT	Send implementation-defined information about another STREAM.
I_STR	Send a STREAMS *ioctl*( ).
I_SWROPT	Set the write mode.
I_GWROPT	Get the write mode.
I_SENDFD	Pass a file descriptor through a STREAMS pipe.
I_RECVFD	Get a file descriptor sent via I_SENDFD.
I_LIST	Get all the module names on a STREAM.
I_ATMARK	Is the top message ‘‘marked’’?
I_CKBAND	See if any messages exist in a band.
I_GETBAND	Get the band of the top message on a STREAM.
I_CANPUT	Is a band writable?
I_SETCLTIME	Set close time delay.
I_GETCLTIME	Get close time delay.
I_LINK	Connect two STREAMs.
I_UNLINK	Disconnect two STREAMs.
I_PLINK	Persistently connect two STREAMs.
I_PUNLINK	Dismantle a persistent STREAMS link.

At least the following macros shall be defined for use with I_LOOK:

FMNAMESZ	The minimum size in bytes of the buffer referred to by the *arg* argument.

At least the following macros shall be defined for use with I_FLUSH:

FLUSHR	Flush read queues.
FLUSHW	Flush write queues.
FLUSHRW	Flush read and write queues.

At least the following macros shall be defined for use with I_SETSIG:

S_RDNORM	A normal (priority band set to 0) message has arrived at the head of a STREAM head read queue.
S_RDBAND	A message with a non-zero priority band has arrived at the head of a STREAM head read queue.
S_INPUT	A message, other than a high-priority message, has arrived at the head of a STREAM head read queue.
S_HIPRI	A high-priority message is present on a STREAM head read queue.
S_OUTPUT	The write queue for normal data (priority band 0) just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) normal data downstream.
S_WRNORM	Equivalent to S_OUTPUT.
S_WRBAND	The write queue for a non-zero priority band just below the STREAM head is no longer full.
S_MSG	A STREAMS signal message that contains the SIGPOLL signal reaches the front of the STREAM head read queue.
S_ERROR	Notification of an error condition reaches the STREAM head.
S_HANGUP	Notification of a hangup reaches the STREAM head.
S_BANDURG	When used in conjunction with S_RDBAND, SIGURG is generated instead of SIGPOLL when a priority message reaches the front of the STREAM head read queue.

At least the following macros shall be defined for use with I_PEEK:

RS_HIPRI	Only look for high-priority messages.

At least the following macros shall be defined for use with I_SRDOPT:

RNORM	Byte-STREAM mode, the default.
RMSGD	Message-discard mode.
RMSGN	Message-nondiscard mode.
RPROTNORM	Fail *read*( ) with [EBADMSG] if a message containing a control part is at the front of the STREAM head read queue.
RPROTDAT	Deliver the control part of a message as data when a process issues a *read*( ).
RPROTDIS	Discard the control part of a message, delivering any data part, when a process issues a *read*( ).

At least the following macros shall be defined for use with I_SWOPT:

SNDZERO	Send a zero-length message downstream when a *write*( ) of 0 bytes occurs.

At least the following macros shall be defined for use with I_ATMARK:

ANYMARK	Check if the message is marked.
LASTMARK	Check if the message is the last one marked on the queue.

At least the following macros shall be defined for use with I_UNLINK:

MUXID_ALL	Unlink all STREAMs linked to the STREAM associated with *fildes*.

The following macros shall be defined for *getmsg*( ), *getpmsg*( ), *putmsg*( ), and *putpmsg*( ):

MSG_ANY	Receive any message.
MSG_BAND	Receive message from specified band.
MSG_HIPRI	Send/receive high-priority message.
MORECTL	More control information is left in message.
MOREDATA	More data is left in message.

The **<stropts.h>** header may make visible all of the symbols from **<unistd.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int    isastream(int);
int    getmsg(int, struct strbuf *restrict, struct strbuf *restrict,
           int *restrict);
int    getpmsg(int, struct strbuf *restrict, struct strbuf *restrict,
           int *restrict, int *restrict);
int    ioctl(int, int, ... );
int    putmsg(int, const struct strbuf *, const struct strbuf *, int);
int    putpmsg(int, const struct strbuf *, const struct strbuf *, int,
           int);
int    fattach(int, const char *);
int    fdetach(const char *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *close*( ), *fcntl*( ), *getmsg*( ), *ioctl*( ), *open*( ), *pipe*( ), *read*( ), *poll*( ), *putmsg*( ), *signal*( ), *write*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

The *flags* member of the **strpeek** and **strfdinsert** structures are changed from **type long** to **t_uscalar_t**.

Issue 6

This header is marked as part of the XSI STREAMS Option Group.

The **restrict** keyword is added to the prototypes for *getmsg*( ) and *getpmsg*( ).

NAME

sys/ipc.h — XSI interprocess communication access structure

SYNOPSIS

XSI

```
#include <sys/ipc.h>
```

DESCRIPTION

The **<sys/ipc.h>** header is used by three mechanisms for XSI interprocess communication (IPC): messages, semaphores, and shared memory. All use a common structure type, **ipc_perm** to pass information used in determining permission to perform an IPC operation.

The **ipc_perm** structure shall contain the following members:

`uid_t`	`uid`	Owner's user ID.
`gid_t`	`gid`	Owner's group ID.
`uid_t`	`cuid`	Creator's user ID.
`gid_t`	`cgid`	Creator's group ID.
`mode_t`	`mode`	Read/write permission.

The **uid_t**, **gid_t**, **mode_t**, and **key_t** types shall be defined as described in **<sys/types.h>**.

Definitions shall be provided for the following constants:

Mode bits:

IPC_CREAT	Create entry if key does not exist.
IPC_EXCL	Fail if key exists.
IPC_NOWAIT	Error if request must wait.

Keys:

IPC_PRIVATE	Private key.

Control commands:

IPC_RMID	Remove identifier.
IPC_SET	Set options.
IPC_STAT	Get options.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

```
key_t  ftok(const char *, int);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *ftok*( )

CHANGE HISTORY

First released in Issue 2. Derived from System V Release 2.0.

NAME

sys/mman.h — memory management declarations

SYNOPSIS

`#include <sys/mman.h>`

DESCRIPTION

The **<sys/mman.h>** header shall be supported if the implementation supports at least one of the following options:

- MF The Memory Mapped Files option
- SHM The Shared Memory Objects option
- ML The Process Memory Locking option
- MPR The Memory Protection option
- TYM The Typed Memory Objects option
- SIO The Synchronized Input and Output option
- ADV The Advisory Information option
- TYM The Typed Memory Objects option

MC2 If one or more of the Advisory Information, Memory Mapped Files, or Shared Memory Objects options are supported, the following protection options shall be defined:

MC2	PROT_READ	Page can be read.
MC2	PROT_WRITE	Page can be written.
MC2	PROT_EXEC	Page can be executed.
MC2	PROT_NONE	Page cannot be accessed.

The following *flag* options shall be defined:

MF|SHM	MAP_SHARED	Share changes.
MF|SHM	MAP_PRIVATE	Changes are private.
MF|SHM	MAP_FIXED	Interpret *addr* exactly.

The following flags shall be defined for *msync*( ):

MF|SIO	MS_ASYNC	Perform asynchronous writes.
MF|SIO	MS_SYNC	Perform synchronous writes.
MF|SIO	MS_INVALIDATE	Invalidate mappings.

ML The following symbolic constants shall be defined for the *mlockall*( ) function:

ML	MCL_CURRENT	Lock currently mapped pages.
ML	MCL_FUTURE	Lock pages that become mapped.

MF|SHM The symbolic constant MAP_FAILED shall be defined to indicate a failure from the *mmap*( ) function.

MC1 If the Advisory Information and either the Memory Mapped Files or Shared Memory Objects options are supported, values for *advice* used by *posix_madvise*( ) shall be defined as follows:

POSIX_MADV_NORMAL
The application has no advice to give on its behavior with respect to the specified range. It

is the default characteristic if no advice is given for a range of memory.

POSIX_MADV_SEQUENTIAL
The application expects to access the specified range sequentially from lower addresses to higher addresses.

POSIX_MADV_RANDOM
The application expects to access the specified range in a random order.

POSIX_MADV_WILLNEED
The application expects to access the specified range in the near future.

POSIX_MADV_DONTNEED
The application expects that it will not access the specified range in the near future.

TYM The following flags shall be defined for *posix_typed_mem_open*( ):

POSIX_TYPED_MEM_ALLOCATE
Allocate on *mmap*( ).

POSIX_TYPED_MEM_ALLOCATE_CONTIG
Allocate contiguously on *mmap*( ).

POSIX_TYPED_MEM_MAP_ALLOCATABLE Map on *mmap*( ), without affecting allocatability.

The **mode_t**, **off_t**, and **size_t** types shall be defined as described in **<sys/types.h>**.

TYM The **<sys/mman.h>** header shall define the structure **posix_typed_mem_info**, which includes at least the following member:

`size_t`	`posix_tmi_length`	Maximum length which may be allocated from a typed memory object.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
ML       int    mlock(const void *, size_t);
         int    mlockall(int);
MF|SHM   void  *mmap(void *, size_t, int, int, int, off_t);
MPR      int    mprotect(void *, size_t, int);
MF|SIO   int    msync(void *, size_t, int);
ML       int    munlock(const void *, size_t);
         int    munlockall(void);
MF|SHM   int    munmap(void *, size_t);
ADV      int    posix_madvise(void *, size_t, int);
TYM      int    posix_mem_offset(const void *restrict, size_t, off_t *restrict,
                    size_t *restrict, int *restrict);
         int    posix_typed_mem_get_info(int, struct posix_typed_mem_info *);
         int    posix_typed_mem_open(const char *, int, int);
SHM      int    shm_open(const char *, int, mode_t);
         int    shm_unlink(const char *);
```

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Updated for alignment with the POSIX Realtime Extension.

Issue 6

The **<sys/mman.h>** header is marked as dependent on support for either the _POSIX_MAPPED_FILES, _POSIX_MEMLOCK, or _POSIX_SHARED_MEMORY options.

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The TYM margin code is added to the list of margin codes for the **<sys/mman.h>** header line, as well as for other lines.
- The POSIX_TYPED_MEM_ALLOCATE, POSIX_TYPED_MEM_ALLOCATE_CONTIG, and POSIX_TYPED_MEM_MAP_ALLOCATABLE flags are added.
- The **posix_tmi_length** structure is added.
- The *posix_mem_offset*( ), *posix_typed_mem_get_info*( ), and *posix_typed_mem_open*( ) functions are added.

The **restrict** keyword is added to the prototype for *posix_mem_offset*( ).

IEEE PASC Interpretation 1003.1 #102 is applied adding the prototype for *posix_madvise*( ).

NAME

sys/msg.h — XSI message queue structures

SYNOPSIS

XSI

```
#include <sys/msg.h>
```

DESCRIPTION

The **<sys/msg.h>** header shall define the following constant and members of the structure **msqid_ds**.

The following data types shall be defined through **typedef**:

msgqnum_t	Used for the number of messages in the message queue.
msglen_t	Used for the number of bytes allowed in a message queue.

These types shall be unsigned integer types that are able to store values at least as large as a type **unsigned short**.

Message operation flag:

MSG_NOERROR	No error if big message.

The **msqid_ds** structure shall contain the following members:

`struct ipc_perm`	`msg_perm`	Operation permission structure.
`msgqnum_t`	`msg_qnum`	Number of messages currently on queue.
`msglen_t`	`msg_qbytes`	Maximum number of bytes allowed on queue.
`pid_t`	`msg_lspid`	Process ID of last *msgsnd*( ).
`pid_t`	`msg_lrpid`	Process ID of last *msgrcv*( ).
`time_t`	`msg_stime`	Time of last *msgsnd*( ).
`time_t`	`msg_rtime`	Time of last *msgrcv*( ).
`time_t`	`msg_ctime`	Time of last change.

The **pid_t**, **time_t**, **key_t**, **size_t**, and **ssize_t** types shall be defined as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int      msgctl(int, int, struct msqid_ds *);
int      msgget(key_t, int);
ssize_t  msgrcv(int, void *, size_t, long, int);
int      msgsnd(int, const void *, size_t, int);
```

In addition, all of the symbols from **<sys/ipc.h>** shall be defined when this header is included.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2. Derived from System V Release 2.0.

NAME

sys/resource.h — definitions for XSI resource operations

SYNOPSIS

XSI
```
#include <sys/resource.h>
```

DESCRIPTION

The **<sys/resource.h>** header shall define the following symbolic constants as possible values of the *which* argument of *getpriority*( ) and *setpriority*( ):

PRIO_PROCESS	Identifies the *who* argument as a process ID.
PRIO_PGRP	Identifies the *who* argument as a process group ID.
PRIO_USER	Identifies the *who* argument as a user ID.

The following type shall be defined through **typedef**:

rlim_t	Unsigned integer type used for limit values.

The following symbolic constants shall be defined:

RLIM_INFINITY	A value of **rlim_t** indicating no limit.
RLIM_SAVED_MAX	A value of type **rlim_t** indicating an unrepresentable saved hard limit.
RLIM_SAVED_CUR	A value of type **rlim_t** indicating an unrepresentable saved soft limit.

On implementations where all resource limits are representable in an object of type **rlim_t**, RLIM_SAVED_MAX and RLIM_SAVED_CUR need not be distinct from RLIM_INFINITY.

The following symbolic constants shall be defined as possible values of the *who* parameter of *getrusage*( ):

RUSAGE_SELF	Returns information about the current process.
RUSAGE_CHILDREN	Returns information about children of the current process.

The **<sys/resource.h>** header shall define the **rlimit** structure that includes at least the following members:

`rlim_t rlim_cur`	The current (soft) limit.
`rlim_t rlim_max`	The hard limit.

The **<sys/resource.h>** header shall define the **rusage** structure that includes at least the following members:

`struct timeval ru_utime`	User time used.
`struct timeval ru_stime`	System time used.

The **timeval** structure shall be defined as described in **<sys/time.h>**.

The following symbolic constants shall be defined as possible values for the *resource* argument of *getrlimit*( ) and *setrlimit*( ):

RLIMIT_CORE	Limit on size of core dump file.
RLIMIT_CPU	Limit on CPU time per process.
RLIMIT_DATA	Limit on data segment size.
RLIMIT_FSIZE	Limit on file size.

RLIMIT_NOFILE	Limit on number of open files.
RLIMIT_STACK	Limit on stack size.
RLIMIT_AS	Limit on address space size.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided. |

```
int  getpriority(int, id_t);
int  getrlimit(int, struct rlimit *);
int  getrusage(int, struct rusage *);
int  setpriority(int, id_t, int);
int  setrlimit(int, const struct rlimit *);
```

The **id_t** type shall be defined through **typedef** as described in **<sys/types.h>**.

Inclusion of the **<sys/resource.h>** header may also make visible all symbols from **<sys/time.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/time.h>, **<sys/types.h>**, the System Interfaces volume of IEEE Std 1003.1-200x, *getpriority*( ), *getrusage*( ), *getrlimit*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Large File System extensions are added.

NAME

sys/select.h — select types

SYNOPSIS

```
#include <sys/select.h>
```

DESCRIPTION

The **<sys/select.h>** header shall define the **timeval** structure that includes at least the following members:

`time_t`	`tv_sec`	Seconds.
`suseconds_t`	`tv_usec`	Microseconds.

The **time_t** and **suseconds_t** types shall be defined as described in **<sys/types.h>**.

The **sigset_t** type shall be defined as described in **<signal.h>**.

The **timespec** structure shall be defined as described in **<time.h>**.

The **<sys/select.h>** header shall define the **fd_set** type as a structure.

Each of the following may be declared as a function, or defined as a macro, or both:

void *FD_CLR*(int *fd*, fd_set **fdset*)
Clears the bit for the file descriptor *fd* in the file descriptor set *fdset*.

int *FD_ISSET*(int *fd*, fd_set **fdset*)
Returns a non-zero value if the bit for the file descriptor *fd* is set in the file descriptor set by *fdset*, and 0 otherwise.

void *FD_SET*(int *fd*, fd_set **fdset*)
Sets the bit for the file descriptor *fd* in the file descriptor set *fdset*.

void *FD_ZERO*(fd_set **fdset*)
Initializes the file descriptor set *fdset* to have zero bits for all file descriptors.

If implemented as macros, these may evaluate their arguments more than once, so applications should ensure that the arguments they supply are never expressions with side effects.

The following shall be defined as a macro:

FD_SETSIZE
Maximum number of file descriptors in an **fd_set** structure.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int  pselect(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
         const struct timespec *restrict, const sigset_t *restrict);
int  select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
         struct timeval *restrict);
```

Inclusion of the **<sys/select.h>** header may make visible all symbols from the headers **<signal.h>**, **<sys/time.h>**, and **<time.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<signal.h>, **<sys/time.h>**, **<sys/types.h>**, **<time.h>**, the System Interfaces volume of IEEE Std 1003.1-200x, *pselect*( ), *select*( )

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

The requirement for the **fd_set** structure to have a member *fds_bits* has been removed as per The Open Group Base Resolution bwg2001-005.

NAME

sys/sem.h — XSI semaphore facility

SYNOPSIS

XSI

```
#include <sys/sem.h>
```

DESCRIPTION

The **<sys/sem.h>** header shall define the following constants and structures.

Semaphore operation flags:

SEM_UNDO	Set up adjust on exit entry.

Command definitions for the *semctl*( ) function shall be provided as follows:

GETNCNT	Get *semncnt*.
GETPID	Get *sempid*.
GETVAL	Get *semval*.
GETALL	Get all cases of *semval*.
GETZCNT	Get *semzcnt*.
SETVAL	Set *semval*.
SETALL	Set all cases of *semval*.

The **semid_ds** structure shall contain the following members:

`struct ipc_perm`	`sem_perm`	Operation permission structure.
`unsigned short`	`sem_nsems`	Number of semaphores in set.
`time_t`	`sem_otime`	Last *semop*( ) time.
`time_t`	`sem_ctime`	Last time changed by *semctl*( ).

The **pid_t**, **time_t**, **key_t**, and **size_t** types shall be defined as described in **<sys/types.h>**.

A semaphore shall be represented by an anonymous structure containing the following members:

`unsigned short`	`semval`	Semaphore value.
`pid_t`	`sempid`	Process ID of last operation.
`unsigned short`	`semncnt`	Number of processes waiting for *semval* to become greater than current value.
`unsigned short`	`semzcnt`	Number of processes waiting for *semval* to become 0.

The **sembuf** structure shall contain the following members:

`unsigned short`	`sem_num`	Semaphore number.
`short`	`sem_op`	Semaphore operation.
`short`	`sem_flg`	Operation flags.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int   semctl(int, int, int, ...);
int   semget(key_t, int, int);
int   semop(int, struct sembuf *, size_t);
```

In addition, all of the symbols from **<sys/ipc.h>** shall be defined when this header is included.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

<sys/types.h>, *semctl*( ), *semget*( ), *semop*( )

CHANGE HISTORY

First released in Issue 2. Derived from System V Release 2.0.

NAME

sys/shm.h — XSI shared memory facility

SYNOPSIS

XSI

```
#include <sys/shm.h>
```

DESCRIPTION

The **<sys/shm.h>** header shall define the following symbolic constants:

SHM_RDONLY	Attach read-only (else read-write).
SHM_RND	Round attach address to SHMLBA.

The **<sys/shm.h>** header shall define the following symbolic value:

SHMLBA	Segment low boundary address multiple.

The following data types shall be defined through **typedef**:

shmatt_t	Unsigned integer used for the number of current attaches that must be able to store values at least as large as a type **unsigned short**.

The **shmid_ds** structure shall contain the following members:

`struct ipc_perm`	`shm_perm`	Operation permission structure.
`size_t`	`shm_segsz`	Size of segment in bytes.
`pid_t`	`shm_lpid`	Process ID of last shared memory operation.
`pid_t`	`shm_cpid`	Process ID of creator.
`shmatt_t`	`shm_nattch`	Number of current attaches.
`time_t`	`shm_atime`	Time of last *shmat*( ).
`time_t`	`shm_dtime`	Time of last *shmdt*( ).
`time_t`	`shm_ctime`	Time of last change by *shmctl*( ).

The **pid_t**, **time_t**, **key_t**, and **size_t** types shall be defined as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
void *shmat(int, const void *, int);
int   shmctl(int, int, struct shmid_ds *);
int   shmdt(const void *);
int   shmget(key_t, size_t, int);
```

In addition, all of the symbols from **<sys/ipc.h>** shall be defined when this header is included.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *shmat*( ), *shmctl*( ), *shmdt*( ), *shmget*( )

CHANGE HISTORY

First released in Issue 2. Derived from System V Release 2.0.

Issue 5

The type of *shm_segsz* is changed from **int** to **size_t**.

NAME

sys/socket.h — main sockets header

SYNOPSIS

```
#include <sys/socket.h>
```

DESCRIPTION

The **<sys/socket.h>** header shall define the type **socklen_t**, which is an integer type of width of at least 32 bits; see APPLICATION USAGE.

The **<sys/socket.h>** header shall define the unsigned integer type **sa_family_t**.

The **<sys/socket.h>** header shall define the **sockaddr** structure that includes at least the following members:

`sa_family_t`	`sa_family`	Address family.
`char`	`sa_data[]`	Socket address (variable-length data).

The **sockaddr** structure is used to define a socket address which is used in the *bind*( ), *connect*( ), *getpeername*( ), *getsockname*( ), *recvfrom*( ), and *sendto*( ) functions.

The **<sys/socket.h>** header shall define the **sockaddr_storage** structure. This structure shall be:

- Large enough to accommodate all supported protocol-specific address structures
- Aligned at an appropriate boundary so that pointers to it can be cast as pointers to protocol-specific address structures and used to access the fields of those structures without alignment problems

The **sockaddr_storage** structure shall contain at least the following members:

```
sa_family_t   ss_family
```

When a **sockaddr_storage** structure is cast as a **sockaddr** structure, the *ss_family* field of the **sockaddr_storage** structure shall map onto the *sa_family* field of the **sockaddr** structure. When a **sockaddr_storage** structure is cast as a protocol-specific address structure, the *ss_family* field shall map onto a field of that structure that is of type **sa_family_t** and that identifies the protocol's address family.

The **<sys/socket.h>** header shall define the **msghdr** structure that includes at least the following members:

`void`	`*msg_name`	Optional address.
`socklen_t`	`msg_namelen`	Size of address.
`struct iovec`	`*msg_iov`	Scatter/gather array.
`int`	`msg_iovlen`	Members in msg_iov.
`void`	`*msg_control`	Ancillary data; see below.
`socklen_t`	`msg_controllen`	Ancillary data buffer len.
`int`	`msg_flags`	Flags on received message.

The **msghdr** structure is used to minimize the number of directly supplied parameters to the *recvmsg*( ) and *sendmsg*( ) functions. This structure is used as a *value*-*result* parameter in the *recvmsg*( ) function and *value* only for the *sendmsg*( ) function.

The **iovec** structure shall be defined as described in **<sys/uio.h>**.

The **<sys/socket.h>** header shall define the **cmsghdr** structure that includes at least the following members:

`socklen_t`	`cmsg_len`	Data byte count, including the cmsghdr.
`int`	`cmsg_level`	Originating protocol.

`int`	`cmsg_type`	Protocol-specific type.

The **cmsghdr** structure is used for storage of ancillary data object information.

Ancillary data consists of a sequence of pairs, each consisting of a **cmsghdr** structure followed by a data array. The data array contains the ancillary data message, and the **cmsghdr** structure contains descriptive information that allows an application to correctly parse the data.

The values for *cmsg_level* shall be legal values for the *level* argument to the *getsockopt*( ) and *setsockopt*( ) functions. The system documentation shall specify the *cmsg_type* definitions for the supported protocols.

Ancillary data is also possible at the socket level. The **<sys/socket.h>** header defines the following macro for use as the *cmsg_type* value when *cmsg_level* is SOL_SOCKET:

SCM_RIGHTS	Indicates that the data array contains the access rights to be sent or received.

The **<sys/socket.h>** header defines the following macros to gain access to the data arrays in the ancillary data associated with a message header:

CMSG_DATA(*cmsg*)

If the argument is a pointer to a **cmsghdr** structure, this macro shall return an unsigned character pointer to the data array associated with the **cmsghdr** structure.

CMSG_NXTHDR(*mhdr,cmsg*)

If the first argument is a pointer to a **msghdr** structure and the second argument is a pointer to a **cmsghdr** structure in the ancillary data pointed to by the *msg_control* field of that **msghdr** structure, this macro shall return a pointer to the next **cmsghdr** structure, or a null pointer if this structure is the last **cmsghdr** in the ancillary data.

CMSG_FIRSTHDR(*mhdr*)

If the argument is a pointer to a **msghdr** structure, this macro shall return a pointer to the first **cmsghdr** structure in the ancillary data associated with this **msghdr** structure, or a null pointer if there is no ancillary data associated with the **msghdr** structure.

The **<sys/socket.h>** header shall define the **linger** structure that includes at least the following members:

`int`	`l_onoff`	Indicates whether linger option is enabled.
`int`	`l_linger`	Linger time, in seconds.

The **<sys/socket.h>** header shall define the following macros, with distinct integer values:

	SOCK_DGRAM	Datagram socket.
RS	SOCK_RAW	Raw Protocol Interface.
	SOCK_SEQPACKET	Sequenced-packet socket.
	SOCK_STREAM	Byte-stream socket.

The **<sys/socket.h>** header shall define the following macro for use as the *level* argument of *setsockopt*( ) and *getsockopt*( ).

SOL_SOCKET	Options to be accessed at socket level, not protocol level.

The **<sys/socket.h>** header shall define the following macros, with distinct integer values, for use as the *option_name* argument in *getsockopt*( ) or *setsockopt*( ) calls:

SO_ACCEPTCONN	Socket is accepting connections.

SO_BROADCAST	Transmission of broadcast messages is supported.
SO_DEBUG	Debugging information is being recorded.
SO_DONTROUTE	Bypass normal routing.
SO_ERROR	Socket error status.
SO_KEEPALIVE	Connections are kept alive with periodic messages.
SO_LINGER	Socket lingers on close.
SO_OOBINLINE	Out-of-band data is transmitted in line.
SO_RCVBUF	Receive buffer size.
SO_RCVLOWAT	Receive ‘‘low water mark’’.
SO_RCVTIMEO	Receive timeout.
SO_REUSEADDR	Reuse of local addresses is supported.
SO_SNDBUF	Send buffer size.
SO_SNDLOWAT	Send ‘‘low water mark’’.
SO_SNDTIMEO	Send timeout.
SO_TYPE	Socket type.

The **<sys/socket.h>** header shall define the following macro as the maximum *backlog* queue length which may be specified by the *backlog* field of the *listen*( ) function:

SOMAXCONN	The maximum *backlog* queue length.

The **<sys/socket.h>** header shall define the following macros, with distinct integer values, for use as the valid values for the *msg_flags* field in the **msghdr** structure, or the *flags* parameter in *recvfrom*( ), *recvmsg*( ), *sendmsg*( ), or *sendto*( ) calls:

MSG_CTRUNC	Control data truncated.
MSG_DONTROUTE	Send without using routing tables.
MSG_EOR	Terminates a record (if supported by the protocol).
MSG_OOB	Out-of-band data.
MSG_PEEK	Leave received data in queue.
MSG_TRUNC	Normal data truncated.
MSG_WAITALL	Attempt to fill the read buffer.

The **<sys/socket.h>** header shall define the following macros, with distinct integer values:

AF_INET	Internet domain sockets for use with IPv4 addresses.
IP6 AF_INET6	Internet domain sockets for use with IPv6 addresses.
AF_UNIX	UNIX domain sockets.
AF_UNSPEC	Unspecified .

The **<sys/socket.h>** header shall define the following macros, with distinct integer values:

SHUT_RD	Disables further receive operations.

SHUT_RDWR	Disables further send and receive operations.
SHUT_WR	Disables further send operations.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int     accept(int, struct sockaddr *restrict, socklen_t *restrict);
int     bind(int, const struct sockaddr *, socklen_t);
int     connect(int, const struct sockaddr *, socklen_t);
int     getpeername(int, struct sockaddr *restrict, socklen_t *restrict);
int     getsockname(int, struct sockaddr *restrict, socklen_t *restrict);
int     getsockopt(int, int, int, void *restrict, socklen_t *restrict);
int     listen(int, int);
ssize_t recv(int, void *, size_t, int);
ssize_t recvfrom(int, void *restrict, size_t, int,
        struct sockaddr *restrict, socklen_t *restrict);
ssize_t recvmsg(int, struct msghdr *, int);
ssize_t send(int, const void *, size_t, int);
ssize_t sendmsg(int, const struct msghdr *, int);
ssize_t sendto(int, const void *, size_t, int, const struct sockaddr *,
        socklen_t);
int     setsockopt(int, int, int, const void *, socklen_t);
int     shutdown(int, int);
int     socket(int, int, int);
int     socketpair(int, int, int, int[2]);
```

Inclusion of **<sys/socket.h>** may also make visible all symbols from **<sys/uio.h>**.

APPLICATION USAGE

To forestall portability problems, it is recommended that applications not use values larger than $2^{31}-1$ for the **socklen_t** type.

The **sockaddr_storage** structure solves the problem of declaring storage for automatic variables which is both large enough and aligned enough for storing the socket address data structure of any family. For example, code with a file descriptor and without the context of the address family can pass a pointer to a variable of this type, where a pointer to a socket address structure is expected in calls such as *getpeername*( ), and determine the address family by accessing the received content after the call.

The example below illustrates a data structure which aligns on a 64-bit boundary. An implementation-defined field *_ss_align* following *_ss_pad1* is used to force a 64-bit alignment which covers proper alignment good enough for needs of at least **sockaddr_in6** (IPv6) and **sockaddr_in** (IPv4) address data structures. The size of padding field *_ss_pad1* depends on the chosen alignment boundary. The size of padding field *_ss_pad2* depends on the value of overall size chosen for the total size of the structure. This size and alignment are represented in the above example by implementation-defined (not required) constants _SS_MAXSIZE (chosen value 128) and _SS_ALIGNMENT (with chosen value 8). Constants _SS_PAD1SIZE (derived value 6) and _SS_PAD2SIZE (derived value 112) are also for illustration and not required. The implementation-defined definitions and structure field names above start with an underscore to denote implementation private name space. Portable code is not expected to access or reference those fields or constants.

```
/*
 *  Desired design of maximum size and alignment.
 */
```

```
#define _SS_MAXSIZE 128
    /* Implementation-defined maximum size. */
#define _SS_ALIGNSIZE (sizeof(int64_t))
    /* Implementation-defined desired alignment. */

/*
 *  Definitions used for sockaddr_storage structure paddings design.
 */
#define _SS_PAD1SIZE (_SS_ALIGNSIZE − sizeof(sa_family_t))
#define _SS_PAD2SIZE (_SS_MAXSIZE − (sizeof(sa_family_t)+
                      _SS_PAD1SIZE + _SS_ALIGNSIZE))
struct sockaddr_storage {
    sa_family_t  ss_family;  /* Address family. */
/*
 * Following fields are implementation-defined. */
 */
    char _ss_pad1[_SS_PAD1SIZE];
        /* 6-byte pad; this is to make implementation-defined
           pad up to alignment field that follows explicit in
           the data structure. */
    int64_t _ss_align;  /* Field to force desired structure
                           storage alignment. */
    char _ss_pad2[_SS_PAD2SIZE];
        /* 112-byte pad to achieve desired size,
           _SS_MAXSIZE value minus size of ss_family
           __ss_pad1, __ss_align fields is 112. */
};
```

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the prototypes for *accept*( ), *getpeername*( ), *getsockname*( ), *getsockopt*( ), and *recvfrom*( ).

NAME

sys/stat.h — data returned by the stat( ) function

SYNOPSIS

```
#include <sys/stat.h>
```

DESCRIPTION

The **<sys/stat.h>** header shall define the structure of the data returned by the functions *fstat*( ), *lstat*( ), and *stat*( ).

The **stat** structure shall contain at least the following members:

	`dev_t`	`st_dev`	ID of device containing file.
	`ino_t`	`st_ino`	File serial number.
	`mode_t`	`st_mode`	Mode of file (see below).
	`nlink_t`	`st_nlink`	Number of hard links to the file.
	`uid_t`	`st_uid`	User ID of file.
	`gid_t`	`st_gid`	Group ID of file.
XSI	`dev_t`	`st_rdev`	Device ID (if file is character or block special).
	`off_t`	`st_size`	For regular files, the file size in bytes. For symbolic links, the length in bytes of the pathname contained in the symbolic link.
SHM			For a shared memory object, the length in bytes.
TYM			For a typed memory object, the length in bytes.
			For other file types, the use of this field is unspecified
	`time_t`	`st_atime`	Time of last access.
	`time_t`	`st_mtime`	Time of last data modification.
	`time_t`	`st_ctime`	Time of last status change.
XSI	`blksize_t`	`st_blksize`	A file system-specific preferred I/O block size for this object. In some file system types, this may vary from file to file.
	`blkcnt_t`	`st_blocks`	Number of blocks allocated for this object.

File serial number and device ID taken together uniquely identify the file within the system. The **blkcnt_t**, **blksize_t**, **dev_t**, **ino_t**, **mode_t**, **nlink_t**, **uid_t**, **gid_t**, **off_t**, and **time_t** types shall be defined as described in **<sys/types.h>**. Times shall be given in seconds since the Epoch.

Unless otherwise specified, the structure members *st_mode*, *st_ino*, *st_dev*, *st_uid*, *st_gid*, *st_atime*, *st_ctime*, and *st_mtime* shall have meaningful values for all file types defined in IEEE Std 1003.1-200x.

For symbolic links, the *st_mode* member shall contain meaningful information, which can be used with the file type macros described below, that take a *mode* argument. The *st_size* member shall contain the length, in bytes, of the pathname contained in the symbolic link. File mode bits and the contents of the remaining members of the **stat** structure are unspecified. The value returned in the *st_size* field shall be the length of the contents of the symbolic link, and shall not count a trailing null if one is present.

The following symbolic names for the values of type *mode_t* shall also be defined.

File type:

XSI	S_IFMT	Type of file.	
		S_IFBLK	Block special.

	S_IFCHR	Character special.
	S_IFIFO	FIFO special.
	S_IFREG	Regular.
	S_IFDIR	Directory.
	S_IFLNK	Symbolic link.
	S_IFSOCK	Socket.

File mode bits:

S_IRWXU	Read, write, execute/search by owner.	
	S_IRUSR	Read permission, owner.
	S_IWUSR	Write permission, owner.
	S_IXUSR	Execute/search permission, owner.
S_IRWXG	Read, write, execute/search by group.	
	S_IRGRP	Read permission, group.
	S_IWGRP	Write permission, group.
	S_IXGRP	Execute/search permission, group.
S_IRWXO	Read, write, execute/search by others.	
	S_IROTH	Read permission, others.
	S_IWOTH	Write permission, others.
	S_IXOTH	Execute/search permission, others.
S_ISUID	Set-user-ID on execution.	
S_ISGID	Set-group-ID on execution.	
XSI S_ISVTX	On directories, restricted deletion flag.	

The bits defined by S_IRUSR, S_IWUSR, S_IXUSR, S_IRGRP, S_IWGRP, S_IXGRP, S_IROTH,
XSI S_IWOTH, S_IXOTH, S_ISUID, S_ISGID, and S_ISVTX shall be unique.

S_IRWXU is the bitwise-inclusive OR of S_IRUSR, S_IWUSR, and S_IXUSR.

S_IRWXG is the bitwise-inclusive OR of S_IRGRP, S_IWGRP, and S_IXGRP.

S_IRWXO is the bitwise-inclusive OR of S_IROTH, S_IWOTH, and S_IXOTH.

Implementations may OR other implementation-defined bits into S_IRWXU, S_IRWXG, and S_IRWXO, but they shall not overlap any of the other bits defined in this volume of IEEE Std 1003.1-200x. The *file permission bits* are defined to be those corresponding to the bitwise-inclusive OR of S_IRWXU, S_IRWXG, and S_IRWXO.

The following macros shall be provided to test whether a file is of the specified type. The value *m* supplied to the macros is the value of *st_mode* from a **stat** structure. The macro shall evaluate to a non-zero value if the test is true; 0 if the test is false.

S_ISBLK(*m*)	Test for a block special file.
S_ISCHR(*m*)	Test for a character special file.

S_ISDIR(*m*)	Test for a directory.
S_ISFIFO(*m*)	Test for a pipe or FIFO special file.
S_ISREG(*m*)	Test for a regular file.
S_ISLNK(*m*)	Test for a symbolic link.
S_ISSOCK(*m*)	Test for a socket.

The implementation may implement message queues, semaphores, or shared memory objects as distinct file types. The following macros shall be provided to test whether a file is of the specified type. The value of the *buf* argument supplied to the macros is a pointer to a **stat** structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the **stat** structure referenced by *buf*. Otherwise, the macro shall evaluate to zero.

S_TYPEISMQ(*buf*)	Test for a message queue.
S_TYPEISSEM(*buf*)	Test for a semaphore.
S_TYPEISSHM(*buf*)	Test for a shared memory object.

TYM The implementation may implement typed memory objects as distinct file types, and the following macro shall test whether a file is of the specified type. The value of the *buf* argument supplied to the macros is a pointer to a **stat** structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the **stat** structure referenced by *buf*. Otherwise, the macro shall evaluate to zero.

S_TYPEISTMO(*buf*)	Test macro for a typed memory object.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int    chmod(const char *, mode_t);
int    fchmod(int, mode_t);
int    fstat(int, struct stat *);
int    lstat(const char *restrict, struct stat *restrict);
int    mkdir(const char *, mode_t);
int    mkfifo(const char *, mode_t);
int    mknod(const char *, mode_t, dev_t);
int    stat(const char *restrict, struct stat *restrict);
mode_t umask(mode_t);
```

XSI (mknod)

APPLICATION USAGE

Use of the macros is recommended for determining the type of a file.

RATIONALE

A conforming C-language application must include **<sys/stat.h>** for functions that have arguments or return values of type **mode_t**, so that symbolic values for that type can be used. An alternative would be to require that these constants are also defined by including **<sys/types.h>**.

The S_ISUID and S_ISGID bits may be cleared on any write, not just on *open*( ), as some historical implementations do it.

System calls that update the time entry fields in the **stat** structure must be documented by the implementors. POSIX-conforming systems should not update the time entry fields for functions listed in the System Interfaces volume of IEEE Std 1003.1-200x unless the standard requires that they do, except in the case of documented extensions to the standard.

Note that *st_dev* must be unique within a Local Area Network (LAN) in a ‘‘system’’ made up of multiple computers’ file systems connected by a LAN.

Networked implementations of a POSIX-conforming system must guarantee that all files visible within the file tree (including parts of the tree that may be remotely mounted from other machines on the network) on each individual processor are uniquely identified by the combination of the *st_ino* and *st_dev* fields.

FUTURE DIRECTIONS

No new S_IFMT symbolic names for the file type values of **mode_t** will be defined by IEEE Std 1003.1-200x; if new file types are required, they will only be testable through *S_ISxx*( ) macros instead.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *chmod*( ), *fchmod*( ), *fstat*( ), *lstat*( ), *mkdir*( ), *mkfifo*( ), *mknod*( ), *stat*( ), *umask*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with POSIX Realtime Extension.

The type of *st_blksize* is changed from **long** to **blksize_t**; the type of *st_blocks* is changed from **long** to **blkcnt_t**.

Issue 6

The S_TYPEISMQ( ), S_TYPEISSEM( ), and S_TYPEISSHM( ) macros are unconditionally mandated.

The Open Group Corrigendum U035/4 is applied. In the DESCRIPTION, the types **blksize_t** and **blkcnt_t** have been described.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The **dev_t**, **ino_t**, **mode_t**, **nlink_t**, **uid_t**, **gid_t**, **off_t**, and **time_t** types are mandated.

S_IFSOCK and S_ISSOCK are added for sockets.

The description of **stat** structure members is changed to reflect contents when file type is a symbolic link.

The test macro S_TYPEISTMO is added for alignment with IEEE Std 1003.1j-2000.

The **restrict** keyword is added to the prototypes for *lstat*( ) and *stat*( ).

The *lstat*( ) function is now mandatory.

NAME

sys/statvfs.h — VFS File System information structure

SYNOPSIS

XSI

```
#include <sys/statvfs.h>
```

DESCRIPTION

The **<sys/statvfs.h>** header shall define the **statvfs** structure that includes at least the following members:

`unsigned long`	`f_bsize`	File system block size.
`unsigned long`	`f_frsize`	Fundamental file system block size.
`fsblkcnt_t`	`f_blocks`	Total number of blocks on file system in units of *f_frsize*.
`fsblkcnt_t`	`f_bfree`	Total number of free blocks.
`fsblkcnt_t`	`f_bavail`	Number of free blocks available to non-privileged process.
`fsfilcnt_t`	`f_files`	Total number of file serial numbers.
`fsfilcnt_t`	`f_ffree`	Total number of free file serial numbers.
`fsfilcnt_t`	`f_favail`	Number of file serial numbers available to non-privileged process.
`unsigned long`	`f_fsid`	File system ID.
`unsigned long`	`f_flag`	Bit mask of *f_flag* values.
`unsigned long`	`f_namemax`	Maximum filename length.

The **fsblkcnt_t** and **fsfilcnt_t** types shall be defined as described in **<sys/types.h>**.

The following flags for the *f_flag* member shall be defined:

`ST_RDONLY`	Read-only file system.
`ST_NOSUID`	Does not support setuid/setgid semantics.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int statvfs(const char *restrict, struct statvfs *restrict);
int fstatvfs(int, struct statvfs *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *fstatvfs*( ), *statvfs*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

The type of *f_blocks*, *f_bfree*, and *f_bavail* is changed from **unsigned long** to **fsblkcnt_t**; the type of *f_files*, *f_ffree*, and *f_favail* is changed from **unsigned long** to **fsfilcnt_t**.

Issue 6

The Open Group Corrigendum U035/5 is applied. In the DESCRIPTION, the types **fsblkcnt_t** and **fsfilcnt_t** have been described.

The **restrict** keyword is added to the prototype for *statvfs*( ).

NAME

sys/time.h — time types

SYNOPSIS

XSI
```
#include <sys/time.h>
```

DESCRIPTION

The **<sys/time.h>** header shall define the **timeval** structure that includes at least the following members:

`time_t`	`tv_sec`	Seconds.
`suseconds_t`	`tv_usec`	Microseconds.

The **<sys/time.h>** header shall define the **itimerval** structure that includes at least the following members:

`struct timeval`	`it_interval`	Timer interval.
`struct timeval`	`it_value`	Current value.

The **time_t** and **suseconds_t** types shall be defined as described in **<sys/types.h>**.

The **fd_set** type shall be defined as described in **<sys/select.h>**.

The **<sys/time.h>** header shall define the following values for the *which* argument of *getitimer*( ) and *setitimer*( ):

ITIMER_REAL	Decrements in real time.
ITIMER_VIRTUAL	Decrements in process virtual time.
ITIMER_PROF	Decrements both in process virtual time and when the system is running on behalf of the process.

The following shall be defined as described in **<sys/select.h>**:

FD_CLR( )
FD_ISSET( )
FD_SET( )
FD_ZERO( )
FD_SETSIZE( )

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int   getitimer(int, struct itimerval *);
int   gettimeofday(struct timeval *restrict, void *restrict);
int   select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
          struct timeval *restrict);
int   setitimer(int, const struct itimerval *restrict,
          struct itimerval *restrict);
int   utimes(const char *, const struct timeval [2]); (LEGACY)
```

Inclusion of the **<sys/time.h>** header may make visible all symbols from the **<sys/select.h>** header.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *getitimer*( ), *gettimeofday*( ), *select*( ), *setitimer*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

The type of *tv_usec* is changed from **long** to **suseconds_t**.

Issue 6

The **restrict** keyword is added to the prototypes for *gettimeofday*( ), *select*( ), and *setitimer*( ).

The note is added that inclusion of this header may also make symbols visible from **<sys/socket.h>**.

The *utimes*( ) function is marked LEGACY.

NAME

sys/timeb.h — additional definitions for date and time

SYNOPSIS

XSI
```
#include <sys/timeb.h>
```

DESCRIPTION

The **<sys/timeb.h>** header shall define the **timeb** structure that includes at least the following members:

`time_t`	`time`	The seconds portion of the current time.
`unsigned short`	`millitm`	The milliseconds portion of the current time.
`short`	`timezone`	The local timezone in minutes west of Greenwich.
`short`	`dstflag`	TRUE if Daylight Savings Time is in effect.

The **time_t** type shall be defined as described in **<sys/types.h>**.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided. |

```
int   ftime(struct timeb *); (LEGACY)
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, **<time.h>**

CHANGE HISTORY

Issue 6

The *ftime*( ) function is marked LEGACY.

NAME

sys/times.h — file access and modification times structure

SYNOPSIS

```
#include <sys/times.h>
```

DESCRIPTION

The **<sys/times.h>** header shall define the structure **tms**, which is returned by *times*() and includes at least the following members:

```
clock_t  tms_utime   User CPU time.
clock_t  tms_stime   System CPU time.
clock_t  tms_cutime  User CPU time of terminated child processes.
clock_t  tms_cstime  System CPU time of terminated child processes.
```

The **clock_t** type shall be defined as described in **<sys/types.h>**.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided. |

```
clock_t times(struct tms *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *times*()

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

NAME

sys/types.h — data types

SYNOPSIS

```
#include <sys/types.h>
```

DESCRIPTION

The **<sys/types.h>** header shall include definitions for at least the following types:

	blkcnt_t	Used for file block counts.
	blksize_t	Used for block sizes.
XSI	**clock_t**	Used for system times in clock ticks or CLOCKS_PER_SEC; see **<time.h>**.
TMR	**clockid_t**	Used for clock ID type in the clock and timer functions.
	dev_t	Used for device IDs.
XSI	**fsblkcnt_t**	Used for file system block counts.
XSI	**fsfilcnt_t**	Used for file system file counts.
	gid_t	Used for group IDs.
XSI	**id_t**	Used as a general identifier; can be used to contain at least a **pid_t**, **uid_t**, or **gid_t**.
	ino_t	Used for file serial numbers.
XSI	**key_t**	Used for XSI interprocess communication.
	mode_t	Used for some file attributes.
	nlink_t	Used for link counts.
	off_t	Used for file sizes.
	pid_t	Used for process IDs and process group IDs.
THR	**pthread_attr_t**	Used to identify a thread attribute object.
BAR	**pthread_barrier_t**	Used to identify a barrier.
BAR	**pthread_barrierattr_t**	Used to define a barrier attributes object.
THR	**pthread_cond_t**	Used for condition variables.
THR	**pthread_condattr_t**	Used to identify a condition attribute object.
THR	**pthread_key_t**	Used for thread-specific data keys.
THR	**pthread_mutex_t**	Used for mutexes.
THR	**pthread_mutexattr_t**	Used to identify a mutex attribute object.
THR	**pthread_once_t**	Used for dynamic package initialization.
THR	**pthread_rwlock_t**	Used for read-write locks.
THR	**pthread_rwlockattr_t**	Used for read-write lock attributes.
SPI	**pthread_spinlock_t**	Used to identify a spin lock.
THR	**pthread_t**	Used to identify a thread.

	size_t	Used for sizes of objects.
	ssize_t	Used for a count of bytes or an error indication.
XSI	**suseconds_t**	Used for time in microseconds
	time_t	Used for time in seconds.
TMR	**timer_t**	Used for timer ID returned by *timer_create*( ).
	uid_t	Used for user IDs.
XSI	**useconds_t**	Used for time in microseconds.

All of the types shall be defined as arithmetic types of an appropriate length, with the following exceptions:

XSI **key_t**
THR **pthread_attr_t**
BAR **pthread_barrier_t**
pthread_barrierattr_t
THR **pthread_cond_t**
pthread_condattr_t
pthread_key_t
pthread_mutex_t
pthread_mutexattr_t
pthread_once_t
pthread_rwlock_t
pthread_rwlockattr_t
SPI **pthread_spinlock_t**
TRC **trace_attr_t**
trace_event_id_t
TRC TEF **trace_event_set_t**
TRC **trace_id_t**

Additionally:

- **mode_t** shall be an integer type.
- **nlink_t**, **uid_t**, **gid_t**, and **id_t** shall be integer types.
- **blkcnt_t** and **off_t** shall be signed integer types.
- XSI **fsblkcnt_t**, **fsfilcnt_t**, and **ino_t** shall be defined as unsigned integer types.
- **size_t** shall be an unsigned integer type.
- **blksize_t**, **pid_t**, and **ssize_t** shall be signed integer types.
- **time_t** and **clock_t** shall be integer or real-floating types.

XSI The type **ssize_t** shall be capable of storing values at least in the range [–1, {SSIZE_MAX}]. The type **useconds_t** shall be an unsigned integer type capable of storing values at least in the range [0, 1 000 000]. The type **suseconds_t** shall be a signed integer type capable of storing values at least in the range [–1, 1 000 000].

The implementation shall support one or more programming environments in which the widths of **blksize_t**, **pid_t**, **size_t**, **ssize_t**, **suseconds_t**, and **useconds_t** are no greater than the width of type **long**. The names of these programming environments can be obtained using the *confstr*( ) function or the *getconf* utility.

There are no defined comparison or assignment operators for the following types: |

THR **pthread_attr_t**
BAR **pthread_barrier_t**
pthread_barrierattr_t
THR **pthread_cond_t**
pthread_condattr_t
pthread_mutex_t
pthread_mutexattr_t
pthread_rwlock_t
pthread_rwlockattr_t
SPI **pthread_spinlock_t**
TRC **trace_attr_t**

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<time.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *confstr*( ), the Shell and Utilities volume of IEEE Std 1003.1-200x, *getconf* |

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The **clockid_t** and **timer_t** types are defined for alignment with the POSIX Realtime Extension.

The types **blkcnt_t**, **blksize_t**, **fsblkcnt_t**, **fsfilcnt_t**, and **suseconds_t** are added.

Large File System extensions are added.

Updated for alignment with the POSIX Threads Extension.

Issue 6

The **pthread_barrier_t**, **pthread_barrierattr_t**, and **pthread_spinlock_t** types are added for alignment with IEEE Std 1003.1j-2000.

The margin code is changed from XSI to THR for the **pthread_rwlock_t** and **pthread_rwlockattr_t** types as Read-Write Locks have been absorbed into the POSIX Threads option. The threads types are now marked THR.

NAME

sys/uio.h — definitions for vector I/O operations

SYNOPSIS

XSI

```
#include <sys/uio.h>
```

DESCRIPTION

The **<sys/uio.h>** header shall define the **iovec** structure that includes at least the following members:

`void`	`*iov_base`	Base address of a memory region for input or output.
`size_t`	`iov_len`	The size of the memory pointed to by *iov_base*.

The **<sys/uio.h>** header uses the **iovec** structure for scatter/gather I/O.

The **ssize_t** and **size_t** types shall be defined as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
ssize_t readv(int, const struct iovec *, int);
ssize_t writev(int, const struct iovec *, int);
```

APPLICATION USAGE

The implementation can put a limit on the number of scatter/gather elements which can be processed in one call. The symbol {IOV_MAX} defined in **<limits.h>** should always be used to learn about the limits instead of assuming a fixed value.

RATIONALE

Traditionally, the maximum number of scatter/gather elements the system can process in one call were described by the symbolic value {UIO_MAXIOV}. In IEEE Std 1003.1-200x this value was replaced by the constant {IOV_MAX} which can be found in **<limits.h>**.

FUTURE DIRECTIONS

None.

SEE ALSO

<limits.h>, **<sys/types.h>**, the System Interfaces volume of IEEE Std 1003.1-200x, *read*( ), *write*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 6

Text referring to scatter/gather I/O is added to the DESCRIPTION.

NAME

sys/un.h — definitions for UNIX domain sockets

SYNOPSIS

```
#include <sys/un.h>
```

DESCRIPTION

The **<sys/un.h>** header shall define the **sockaddr_un** structure that includes at least the following members:

`sa_family_t`	`sun_family`	Address family.
`char`	`sun_path[]`	Socket pathname.

The **sockaddr_un** structure is used to store addresses for UNIX domain sockets. Values of this type shall be cast by applications to **struct sockaddr** for use with socket functions.

The **sa_family_t** type shall be defined as described in **<sys/socket.h>**.

APPLICATION USAGE

The size of *sun_path* has intentionally been left undefined. This is because different implementations use different sizes. For example, BSD4.3 uses a size of 108, and BSD4.4 uses a size of 104. Since most implementations originate from BSD versions, the size is typically in the range 92 to 108.

Applications should not assume a particular length for *sun_path* or assume that it can hold _POSIX_PATH_MAX characters (255).

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/socket.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *bind*( ), *socket*( ), *socketpair*( )

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

sys/utsname.h — system name structure

SYNOPSIS

```
#include <sys/utsname.h>
```

DESCRIPTION

The **<sys/utsname.h>** header shall define the structure **utsname** which shall include at least the following members:

`char`	`sysname[]`	Name of this implementation of the operating system.
`char`	`nodename[]`	Name of this node within an implementation-defined communications network.
`char`	`release[]`	Current release level of this implementation.
`char`	`version[]`	Current version level of this release.
`char`	`machine[]`	Name of the hardware type on which the system is running.

The character arrays are of unspecified size, but the data stored in them shall be terminated by a null byte.

The following shall be declared as a function and may also be defined as a macro:

```
int uname(struct utsname *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The System Interfaces volume of IEEE Std 1003.1-200x, *uname*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

NAME

sys/wait.h — declarations for waiting

SYNOPSIS

```
#include <sys/wait.h>
```

DESCRIPTION

The **<sys/wait.h>** header shall define the following symbolic constants for use with *waitpid*( ):

WNOHANG	Do not hang if no status is available; return immediately.
WUNTRACED	Report status of stopped child process.

The **<sys/wait.h>** header shall define the following macros for analysis of process status values:

WEXITSTATUS	Return exit status.
XSI WIFCONTINUED	True if child has been continued
WIFEXITED	True if child exited normally.
WIFSIGNALED	True if child exited due to uncaught signal.
WIFSTOPPED	True if child is currently stopped.
WSTOPSIG	Return signal number that caused process to stop.
WTERMSIG	Return signal number that caused process to terminate.

XSI The following symbolic constants shall be defined as possible values for the *options* argument to *waitid*( ):

WEXITED	Wait for processes that have exited.
WSTOPPED	Status is returned for any child that has stopped upon receipt of a signal.
WCONTINUED	Status is returned for any child that was stopped and has been continued.
WNOHANG	Return immediately if there are no children to wait for.
WNOWAIT	Keep the process whose status is returned in *infop* in a waitable state.

The type **idtype_t** shall be defined as an enumeration type whose possible values shall include at least the following:

P_ALL
P_PID
P_PGID

The **id_t** and **pid_t** types shall be defined as described in **<sys/types.h>**.

XSI The **siginfo_t** type shall be defined as described in **<signal.h>**.

The **rusage** structure shall be defined as described in **<sys/resource.h>**.

Inclusion of the **<sys/wait.h>** header may also make visible all symbols from **<signal.h>** and **<sys/resource.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
pid_t  wait(int *);
int    waitid(idtype_t, id_t, siginfo_t *, int);

Issue 6

The *wait3*( ) function is removed.

NAME

syslog — definitions for system error logging

SYNOPSIS

XSI

```
#include <syslog.h>
```

DESCRIPTION

The **<syslog.h>** header shall define the following symbolic constants, zero or more of which may be OR'ed together to form the *logopt* option of *openlog*( ):

LOG_PID	Log the process ID with each message.
LOG_CONS	Log to the system console on error.
LOG_NDELAY	Connect to syslog daemon immediately.
LOG_ODELAY	Delay open until *syslog*( ) is called.
LOG_NOWAIT	Do not wait for child processes.

The following symbolic constants shall be defined as possible values of the *facility* argument to *openlog*( ):

LOG_KERN	Reserved for message generated by the system.
LOG_USER	Message generated by a process.
LOG_MAIL	Reserved for message generated by mail system.
LOG_NEWS	Reserved for message generated by news system.
LOG_UUCP	Reserved for message generated by UUCP system.
LOG_DAEMON	Reserved for message generated by system daemon.
LOG_AUTH	Reserved for message generated by authorization daemon.
LOG_CRON	Reserved for message generated by the clock daemon.
LOG_LPR	Reserved for message generated by printer system.
LOG_LOCAL0	Reserved for local use.
LOG_LOCAL1	Reserved for local use.
LOG_LOCAL2	Reserved for local use.
LOG_LOCAL3	Reserved for local use.
LOG_LOCAL4	Reserved for local use.
LOG_LOCAL5	Reserved for local use.
LOG_LOCAL6	Reserved for local use.
LOG_LOCAL7	Reserved for local use.

The following shall be declared as macros for constructing the *maskpri* argument to *setlogmask*( ). The following macros expand to an expression of type **int** when the argument *pri* is an expression of type **int**:

LOG_MASK(*pri*)	A mask for priority *pri*.

The following constants shall be defined as possible values for the *priority* argument of *syslog*( ):

LOG_EMERG	A panic condition was reported to all processes.
LOG_ALERT	A condition that should be corrected immediately.
LOG_CRIT	A critical condition.
LOG_ERR	An error message.
LOG_WARNING	A warning message.
LOG_NOTICE	A condition requiring special handling.
LOG_INFO	A general information message.
LOG_DEBUG	A message useful for debugging programs.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided. |

```
void  closelog(void);
void  openlog(const char *, int, int);
int   setlogmask(int);
void  syslog(int, const char *, ...);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Moved to X/Open UNIX to BASE.

NAME

tar.h — extended tar definitions

SYNOPSIS

```
#include <tar.h>
```

DESCRIPTION

The **<tar.h>** header shall define header block definitions as follows.

General definitions:

Name	Description	Value
TMAGIC	`"ustar"`	ustar plus null byte.
TMAGLEN	`6`	Length of the above.
TVERSION	`"00"`	00 without a null byte.
TVERSLEN	`2`	Length of the above.

Typeflag field definitions:

Name	Description	Value
REGTYPE	`'0'`	Regular file.
AREGTYPE	`'\0'`	Regular file.
LNKTYPE	`'1'`	Link.
SYMTYPE	`'2'`	Symbolic link.
CHRTYPE	`'3'`	Character special.
BLKTYPE	`'4'`	Block special.
DIRTYPE	`'5'`	Directory.
FIFOTYPE	`'6'`	FIFO special.
CONTTYPE	`'7'`	Reserved.

Mode field bit definitions (octal):

Name	Description	Value
TSUID	04000	Set UID on execution.
TSGID	02000	Set GID on execution.
TSVTX	01000	On directories, restricted deletion flag.
TUREAD	00400	Read by owner.
TUWRITE	00200	Write by owner special.
TUEXEC	00100	Execute/search by owner.
TGREAD	00040	Read by group.
TGWRITE	00020	Write by group.
TGEXEC	00010	Execute/search by group.
TOREAD	00004	Read by other.
TOWRITE	00002	Write by other.
TOEXEC	00001	Execute/search by other.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 3. Derived from the entry in the POSIX.1-1988 standard.

Issue 6

The SEE ALSO section now refers to *pax* since the Shell and Utilities volume of IEEE Std 1003.1-200x no longer contains the *tar* utility.

NAME

termios.h — define values for termios

SYNOPSIS

```
#include <termios.h>
```

DESCRIPTION

The **<termios.h>** header contains the definitions used by the terminal I/O interfaces (see Chapter 11 (on page 183) for the structures and names defined).

The termios Structure

The following data types shall be defined through **typedef**:

cc_t	Used for terminal special characters.
speed_t	Used for terminal baud rates.
tcflag_t	Used for terminal modes.

The above types shall be all unsigned integer types.

The implementation shall support one or more programming environments in which the widths of **cc_t**, **speed_t**, and **tcflag_t** are no greater than the width of type **long**. The names of these programming environments can be obtained using the *confstr*( ) function or the *getconf* utility.

The **termios** structure shall be defined, and shall include at least the following members:

`tcflag_t`	`c_iflag`	Input modes.
`tcflag_t`	`c_oflag`	Output modes.
`tcflag_t`	`c_cflag`	Control modes.
`tcflag_t`	`c_lflag`	Local modes.
`cc_t`	`c_cc[NCCS]`	Control characters.

A definition shall be provided for:

NCCS	Size of the array *c_cc* for control characters.

The following subscript names for the array *c_cc* shall be defined:

Subscript Usage		
Canonical Mode	**Non-Canonical Mode**	**Description**
VEOF		EOF character.
VEOL		EOL character.
VERASE		ERASE character.
VINTR	VINTR	INTR character.
VKILL		KILL character.
	VMIN	MIN value.
VQUIT	VQUIT	QUIT character.
VSTART	VSTART	START character.
VSTOP	VSTOP	STOP character.
VSUSP	VSUSP	SUSP character.
	VTIME	TIME value.

The subscript values shall be unique, except that the VMIN and VTIME subscripts may have the same values as the VEOF and VEOL subscripts, respectively.

The following flags shall be provided.

Input Modes

The *c_iflag* field describes the basic terminal input control:

	BRKINT	Signal interrupt on break.
	ICRNL	Map CR to NL on input.
	IGNBRK	Ignore break condition.
	IGNCR	Ignore CR.
	IGNPAR	Ignore characters with parity errors.
	INLCR	Map NL to CR on input.
	INPCK	Enable input parity check.
	ISTRIP	Strip character.
XSI	IXANY	Enable any character to restart output.
	IXOFF	Enable start/stop input control.
	IXON	Enable start/stop output control.
	PARMRK	Mark parity errors.

Output Modes

The *c_oflag* field specifies the system treatment of output:

	OPOST	Post-process output.	
XSI	ONLCR	Map NL to CR-NL on output.	
	OCRNL	Map CR to NL on output.	
	ONOCR	No CR output at column 0.	
	ONLRET	NL performs CR function.	
	OFILL	Use fill characters for delay.	
	NLDLY	Select newline delays:	
		NL0	<newline> type 0.
		NL1	<newline> type 1.
	CRDLY	Select carriage-return delays:	
		CR0	Carriage-return delay type 0.
		CR1	Carriage-return delay type 1.
		CR2	Carriage-return delay type 2.
		CR3	Carriage-return delay type 3.
	TABDLY	Select horizontal-tab delays:	
		TAB0	Horizontal-tab delay type 0.
		TAB1	Horizontal-tab delay type 1.
		TAB2	Horizontal-tab delay type 2.

	TAB3	Expand tabs to spaces.
BSDLY	Select backspace delays:	
	BS0	Backspace-delay type 0.
	BS1	Backspace-delay type 1.
VTDLY	Select vertical-tab delays:	
	VT0	Vertical-tab delay type 0.
	VT1	Vertical-tab delay type 1.
FFDLY	Select form-feed delays:	
	FF0	Form-feed delay type 0.
	FF1	Form-feed delay type 1.

Baud Rate Selection

The input and output baud rates are stored in the **termios** structure. These are the valid values for objects of type **speed_t**. The following values shall be defined, but not all baud rates need be supported by the underlying hardware.

B0	Hang up
B50	50 baud
B75	75 baud
B110	110 baud
B134	134.5 baud
B150	150 baud
B200	200 baud
B300	300 baud
B600	600 baud
B1200	1200 baud
B1800	1800 baud
B2400	2400 baud
B4800	4800 baud
B9600	9600 baud
B19200	19200 baud
B38400	38400 baud

Control Modes

The *c_cflag* field describes the hardware control of the terminal; not all values specified are required to be supported by the underlying hardware:

CSIZE	Character size:	
	CS5	5 bits
	CS6	6 bits
	CS7	7 bits
	CS8	8 bits
CSTOPB	Send two stop bits, else one.	
CREAD	Enable receiver.	
PARENB	Parity enable.	
PARODD	Odd parity, else even.	
HUPCL	Hang up on last close.	
CLOCAL	Ignore modem status lines.	

The implementation shall support the functionality associated with the symbols CS7, CS8, CSTOPB, PARODD, and PARENB. |

Local Modes

The *c_lflag* field of the argument structure is used to control various terminal functions:

ECHO	Enable echo.
ECHOE	Echo erase character as error-correcting backspace.
ECHOK	Echo KILL.
ECHONL	Echo NL.
ICANON	Canonical input (erase and kill processing).
IEXTEN	Enable extended input character processing.
ISIG	Enable signals.
NOFLSH	Disable flush after interrupt or quit.
TOSTOP	Send SIGTTOU for background output.

Attribute Selection

The following symbolic constants for use with *tcsetattr*( ) are defined:

TCSANOW	Change attributes immediately.
TCSADRAIN	Change attributes when output has drained.
TCSAFLUSH	Change attributes when output has drained; also flush pending input.

Line Control

The following symbolic constants for use with *tcflush*( ) shall be defined:

TCIFLUSH	Flush pending input. Flush untransmitted output.
TCIOFLUSH	Flush both pending input and untransmitted output.
TCOFLUSH	Flush untransmitted output.

The following symbolic constants for use with *tcflow*( ) shall be defined:

TCIOFF	Transmit a STOP character, intended to suspend input data.
TCION	Transmit a START character, intended to restart input data.
TCOOFF	Suspend output.
TCOON	Restart output.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
speed_t cfgetispeed(const struct termios *);
speed_t cfgetospeed(const struct termios *);
int     cfsetispeed(struct termios *, speed_t);
int     cfsetospeed(struct termios *, speed_t);
int     tcdrain(int);
int     tcflow(int, int);
int     tcflush(int, int);
int     tcgetattr(int, struct termios *);
pid_t   tcgetsid(int);
int     tcsendbreak(int, int);
int     tcsetattr(int, int, const struct termios *);
```

APPLICATION USAGE

The following names are reserved for XSI-conformant systems to use as an extension to the above; therefore strictly conforming applications shall not use them:

CBAUD
DEFECHO
ECHOCTL
ECHOKE
ECHOPRT
EXTA
EXTB
FLUSHO
LOBLK
PENDIN
SWTCH
VDISCARD
VDSUSP
VLNEXT
VREPRINT
VSTATUS
VWERASE

CHANGE HISTORY

First released in Issue 3.

Entry included for alignment with the ISO POSIX-1 standard.

Issue 6

The LEGACY symbols IUCLC, ULCUC, and XCASE are removed.

FIPS 151-2 requirements for the symbols CS7, CS8, CSTOPB, PARODD, and PARENB are reaffirmed.

NAME

tgmath.h — type-generic macros

SYNOPSIS

```
#include <tgmath.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The **<tgmath.h>** header shall include the headers **<math.h>** and **<complex.h>** and shall define several type-generic macros.

Of the functions contained within the **<math.h>** and **<complex.h>** headers without an *f* (**float**) or *l* (**long double**) suffix, several have one or more parameters whose corresponding real type is **double**. For each such function, except *modf*( ), there shall be a corresponding type-generic macro. The parameters whose corresponding real type is **double** in the function synopsis are generic parameters. Use of the macro invokes a function whose corresponding real type and type domain are determined by the arguments for the generic parameters.

Use of the macro invokes a function whose generic parameters have the corresponding real type determined as follows:

- First, if any argument for generic parameters has type **long double**, the type determined is **long double**.
- Otherwise, if any argument for generic parameters has type **double** or is of integer type, the type determined is **double**.
- Otherwise, the type determined is **float**.

For each unsuffixed function in the **<math.h>** header for which there is a function in the **<complex.h>** header with the same name except for a *c* prefix, the corresponding type-generic macro (for both functions) has the same name as the function in the **<math.h>** header. The corresponding type-generic macro for *fabs*( ) and *cabs*( ) is *fabs*( ).

<math.h> Function	**<complex.h> Function**	**Type-Generic Macro**
acos( )	*cacos*( )	*acos*( )
asin( )	*casin*( )	*asin*( )
atan( )	*catan*( )	*atan*( )
acosh( )	*cacosh*( )	*acosh*( )
asinh( )	*casinh*( )	*asinh*( )
atanh( )	*catanh*( )	*atanh*( )
cos( )	*ccos*( )	*cos*( )
sin( )	*csin*( )	*sin*( )
tan( )	*ctan*( )	*tan*( )
cosh( )	*ccosh*( )	*cosh*( )
sinh( )	*csinh*( )	*sinh*( )
tanh( )	*ctanh*( )	*tanh*( )
exp( )	*cexp*( )	*exp*( )
log( )	*clog*( )	*log*( )
pow( )	*cpow*( )	*pow*( )
sqrt( )	*csqrt*( )	*sqrt*( )
fabs( )	*cabs*( )	*fabs*( )

If at least one argument for a generic parameter is complex, then use of the macro invokes a complex function; otherwise, use of the macro invokes a real function.

For each unsuffixed function in the **<math.h>** header without a *c*-prefixed counterpart in the **<complex.h>** header, the corresponding type-generic macro has the same name as the function. These type-generic macros are:

atan2( )	*fma*( )	*llround*( )	*remainder*( )
cbrt( )	*fmax*( )	*log10*( )	*remquo*( )
ceil( )	*fmin*( )	*log1p*( )	*rint*( )
copysign( )	*fmod*( )	*log2*( )	*round*( )
erf( )	*frexp*( )	*logb*( )	*scalbn*( )
erfc( )	*hypot*( )	*lrint*( )	*scalbln*( )
exp2( )	*ilogb*( )	*lround*( )	*tgamma*( )
expm1( )	*ldexp*( )	*nearbyint*( )	*trunc*( )
fdim( )	*lgamma*( )	*nextafter*( )	
floor( )	*llrint*( )	*nexttoward*( )	

If all arguments for generic parameters are real, then use of the macro invokes a real function; otherwise, use of the macro results in undefined behavior.

For each unsuffixed function in the **<complex.h>** header that is not a *c*-prefixed counterpart to a function in the **<math.h>** header, the corresponding type-generic macro has the same name as the function. These type-generic macros are:

carg( )
cimag( )
conj( )
cproj( )
creal( )

Use of the macro with any real or complex argument invokes a complex function.

APPLICATION USAGE

With the declarations:

```
#include <tgmath.h>
int n;
float f;
double d;
long double ld;
float complex fc;
double complex dc;
long double complex ldc;
```

functions invoked by use of type-generic macros are shown in the following table:

Macro	Use Invokes
exp(*n*)	*exp*(*n*), the function
acosh(*f*)	*acoshf*(*f*)
sin(*d*)	*sin*(*d*), the function
atan(*ld*)	*atanl*(*ld*)

Macro	Use Invokes
log(*fc*)	*clogf*(*fc*)
sqrt(*dc*)	*csqrt*(*dc*)
pow(*ldc*,*f*)	*cpowl*(*ldc*, *f*)
remainder(*n*,*n*)	*remainder*(*n*, *n*), the function
nextafter(*d*,*f*)	*nextafter*(*d*, *f*), the function
nexttoward(*f*,*ld*)	*nexttowardf*(*f*, *ld*)
copysign(*n*,*ld*)	*copysignl*(*n*, *ld*)
ceil(*fc*)	Undefined behavior
rint(*dc*)	Undefined behavior
fmax(*ldc*,*ld*)	Undefined behavior
carg(*n*)	*carg*(*n*), the function
cproj(*f*)	*cprojf*(*f*)
creal(*d*)	*creal*(*d*), the function
cimag(*ld*)	*cimagl*(*ld*)
cabs(*fc*)	*cabsf*(*fc*)
carg(*dc*)	*carg*(*dc*), the function
cproj(*ldc*)	*cprojl*(*ldc*)

RATIONALE

Type-generic macros allow calling a function whose type is determined by the argument type, as is the case for C operators such as `'+'` and `'*'`. For example, with a type-generic *cos*( ) macro, the expression *cos*((**float**)*x*) will have type **float**. This feature enables writing more portably efficient code and alleviates need for awkward casting and suffixing in the process of porting or adjusting precision. Generic math functions are a widely appreciated feature of Fortran.

The only arguments that affect the type resolution are the arguments corresponding to the parameters that have type **double** in the synopsis. Hence the type of a type-generic call to *nexttoward*( ), whose second parameter is **long double** in the synopsis, is determined solely by the type of the first argument.

The term ‘‘type-generic’’ was chosen over the proposed alternatives of intrinsic and overloading. The term is more specific than intrinsic, which already is widely used with a more general meaning, and reflects a closer match to Fortran’s generic functions than to C++ overloading.

The macros are placed in their own header in order not to silently break old programs that include the **<math.h>** header; for example, with:

```
printf ("%e", sin(x))
```

modf(**double**, **double** *) is excluded because no way was seen to make it safe without complicating the type resolution.

The implementation might, as an extension, endow appropriate ones of the macros that IEEE Std 1003.1-200x specifies only for real arguments with the ability to invoke the complex functions.

IEEE Std 1003.1-200x does not prescribe any particular implementation mechanism for generic macros. It could be implemented simply with built-in macros. The generic macro for *sqrt*( ), for example, could be implemented with:

```
#undef sqrt
#define sqrt(x) __BUILTIN_GENERIC_sqrt(x)
```

Generic macros are designed for a useful level of consistency with C++ overloaded math functions.

The great majority of existing C programs are expected to be unaffected when the **<tgmath.h>** header is included instead of the **<math.h>** or **<complex.h>** headers. Generic macros are similar to the ISO/IEC 9899:1999 standard library masking macros, though the semantic types of return values differ.

The ability to overload on integer as well as floating types would have been useful for some functions; for example, *copysign*( ). Overloading with different numbers of arguments would have allowed reusing names; for example, *remainder*( ) for *remquo*( ). However, these facilities would have complicated the specification; and their natural consistent use, such as for a floating *abs*( ) or a two-argument *atan*( ), would have introduced further inconsistencies with the ISO/IEC 9899:1999 standard for insufficient benefit.

The ISO C standard in no way limits the implementation's options for efficiency, including inlining library functions.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

NAME

time.h — time types

SYNOPSIS

```
#include <time.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of these symbols in this header.

The **<time.h>** header shall declare the structure **tm**, which shall include at least the following members:

`int`	`tm_sec`	Seconds [0,60].
`int`	`tm_min`	Minutes [0,59].
`int`	`tm_hour`	Hour [0,23].
`int`	`tm_mday`	Day of month [1,31].
`int`	`tm_mon`	Month of year [0,11].
`int`	`tm_year`	Years since 1900.
`int`	`tm_wday`	Day of week [0,6] (Sunday =0).
`int`	`tm_yday`	Day of year [0,365].
`int`	`tm_isdst`	Daylight savings flag.

The value of *tm_isdst* shall be positive if Daylight Saving Time is in effect, 0 if Daylight Saving Time is not in effect, and negative if the information is not available.

The **<time.h>** header shall define the following symbolic names:

NULL	Null pointer constant.
CLOCKS_PER_SEC	A number used to convert the value returned by the *clock*( ) function into seconds.
TMR|CPT CLOCK_PROCESS_CPUTIME_ID	The identifier of the CPU-time clock associated with the process making a *clock*( ) or *timer**( ) function call.
TMR|TCT CLOCK_THREAD_CPUTIME_ID	The identifier of the CPU-time clock associated with the thread making a *clock*( ) or *timer**( ) function call.

TMR The **<time.h>** header shall declare the structure **timespec**, which has at least the following members:

`time_t`	`tv_sec`	Seconds.
`long`	`tv_nsec`	Nanoseconds.

The **<time.h>** header shall also declare the **itimerspec** structure, which has at least the following members:

`struct timespec`	`it_interval`	Timer period.
`struct timespec`	`it_value`	Timer expiration.

The following manifest constants shall be defined:

CLOCK_REALTIME	The identifier of the system-wide realtime clock.
TIMER_ABSTIME	Flag indicating time is absolute with respect to the clock associated with a timer.

MON CLOCK_MONOTONIC
The identifier for the system-wide monotonic clock, which is defined as a clock whose value cannot be set via *clock_settime*() and which cannot have backward clock jumps. The maximum possible clock jump shall be implementation-defined.

TMR The **clock_t**, **size_t**, **time_t**, **clockid_t**, and **timer_t** types shall be defined as described in **<sys/types.h>**.

XSI Although the value of CLOCKS_PER_SEC is required to be 1 million on all XSI-conformant systems, it may be variable on other systems, and it should not be assumed that CLOCKS_PER_SEC is a compile-time constant.

XSI The **<time.h>** header shall provide a declaration for *getdate_err*.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
char      *asctime(const struct tm *);
char      *asctime_r(const struct tm *restrict, char *restrict);
clock_t    clock(void);
int        clock_getcpuclockid(pid_t, clockid_t *);
int        clock_getres(clockid_t, struct timespec *);
int        clock_gettime(clockid_t, struct timespec *);
int        clock_nanosleep(clockid_t, int, const struct timespec *,
               struct timespec *);
int        clock_settime(clockid_t, const struct timespec *);
char      *ctime(const time_t *);
char      *ctime_r(const time_t *, char *);
double     difftime(time_t, time_t);
struct tm *getdate(const char *);
struct tm *gmtime(const time_t *);
struct tm *gmtime_r(const time_t *restrict, struct tm *restrict);
struct tm *localtime(const time_t *);
struct tm *localtime_r(const time_t *restrict, struct tm *restrict);
time_t     mktime(struct tm *);
int        nanosleep(const struct timespec *, struct timespec *);
size_t     strftime(char *restrict, size_t, const char *restrict,
           const struct tm *restrict);
char      *strptime(const char *restrict, const char *restrict,
               struct tm *restrict);
time_t     time(time_t *);
int        timer_create(clockid_t, struct sigevent *restrict,
               timer_t *restrict);
int        timer_delete(timer_t);
int        timer_gettime(timer_t, struct itimerspec *);
int        timer_getoverrun(timer_t);
int        timer_settime(timer_t, int, const struct itimerspec *restrict,
               struct itimerspec *restrict);
void       tzset(void);
```

The following shall be declared as variables:

```
extern int    daylight;
extern long   timezone;
```

CX
```
extern char   *tzname[];
```

CX Inclusion of the **<time.h>** header may make visible all symbols from the **<signal.h>** header.

APPLICATION USAGE

The range [0,60] for *tm_sec* allows for the occasional leap second.

tm_year is a signed value; therefore, years before 1900 may be represented.

To obtain the number of clock ticks per second returned by the *times*( ) function, applications should call *sysconf*(_SC_CLK_TCK).

RATIONALE

The range [0,60] seconds allows for positive or negative leap seconds. The formal definition of UTC does not permit double leap seconds, so all mention of double leap seconds has been removed, and the range shortened from the former [0,61] seconds seen in previous versions of POSIX.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *asctime*( ), *clock*( ), *clock_getcpuclockid*( ), *clock_getres*( ), *clock_nanosleep*( ), *ctime*( ), *difftime*( ), *getdate*( ), *gmtime*( ), *localtime*( ), *mktime*( ), *nanosleep*( ), *strftime*( ), *strptime*( ), *sysconf*( ), *time*( ), *timer_create*( ), *timer_delete*( ), *timer_getoverrun*( ), *tzname*, *tzset*( ), *utime*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Issue 6

The Open Group Corrigendum U035/6 is applied. In the DESCRIPTION, the types **clockid_t** and **timer_t** have been described.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The POSIX timer-related functions are now marked as part of the Timers option.

The symbolic name CLK_TCK is removed. Application usage is added describing how its equivalent functionality can be obtained using *sysconf*( ).

The *clock_getcpuclockid*( ) function and manifest constants CLOCK_PROCESS_CPUTIME_ID and CLOCK_THREAD_CPUTIME_ID are added for alignment with IEEE Std 1003.1d-1999.

The manifest constant CLOCK_MONOTONIC and the *clock_nanosleep*( ) function are added for alignment with IEEE Std 1003.1j-2000.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The range for seconds is changed from [0,61] to [0,60].
- The **restrict** keyword is added to the prototypes for *asctime_r*( ), *gmtime_r*( ), *localtime_r*( ), *strftime*( ), *strptime*( ), *timer_create*( ), and *timer_settime*( ).

IEEE PASC Interpretation 1003.1 #84 is applied adding the statement that symbols from the **<signal.h>** header may be made visible when the **<time.h>** header is included.

Extensions beyond the ISO C standard are now marked.

NAME

trace.h — tracing

SYNOPSIS

TRC

```
#include <trace.h>
```

DESCRIPTION

The **<trace.h>** header shall define the **posix_trace_event_info** structure that includes at least the following members:

```
trace_event_id_t  posix_event_id
pid_t             posix_pid
void             *posix_prog_address
int               posix_truncation_status
struct timespec   posix_timestamp
```

THR

```
pthread_t         posix_thread_id
```

The **<trace.h>** header shall define the **posix_trace_status_info** structure that includes at least the following members:

```
int     posix_stream_status
int     posix_stream_full_status
int     posix_stream_overrun_status
```

TRL

```
int     posix_stream_flush_status
int     posix_stream_flush_error
int     posix_log_overrun_status
int     posix_log_full_status
```

The **<trace.h>** header shall define the following symbols:

POSIX_TRACE_RUNNING
POSIX_TRACE_SUSPENDED
POSIX_TRACE_FULL
POSIX_TRACE_NOT_FULL
POSIX_TRACE_NO_OVERRUN
POSIX_TRACE_OVERRUN
TRL POSIX_TRACE_FLUSHING
POSIX_TRACE_NOT_FLUSHING
POSIX_TRACE_NOT_TRUNCATED
POSIX_TRACE_TRUNCATED_READ
POSIX_TRACE_TRUNCATED_RECORD
TRL POSIX_TRACE_FLUSH
POSIX_TRACE_LOOP
POSIX_TRACE_UNTIL_FULL
TRI POSIX_TRACE_CLOSE_FOR_CHILD
POSIX_TRACE_INHERITED
TRL POSIX_TRACE_APPEND
POSIX_TRACE_LOOP
POSIX_TRACE_UNTIL_FULL
TEF POSIX_TRACE_FILTER
TRL POSIX_TRACE_FLUSH_START
POSIX_TRACE_FLUSH_STOP
POSIX_TRACE_OVERFLOW

POSIX_TRACE_RESUME
POSIX_TRACE_START
POSIX_TRACE_STOP
POSIX_TRACE_UNNAMED_USER_EVENT

The following types shall be defined as described in **<sys/types.h>**:

trace_attr_t
trace_id_t
trace_event_id_t
TEF **trace_event_set_t**

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
    int  posix_trace_attr_destroy(trace_attr_t *);
    int  posix_trace_attr_getclockres(const trace_attr_t *,
             struct timespec *);
    int  posix_trace_attr_getcreatetime(const trace_attr_t *,
             struct timespec *);
    int  posix_trace_attr_getgenversion(const trace_attr_t *, char *);
TRI int  posix_trace_attr_getinherited(const trace_attr_t *restrict,
             int *restrict);
TRL int  posix_trace_attr_getlogfullpolicy(const trace_attr_t *restrict,
             int *restrict);
    int  posix_trace_attr_getlogsize(const trace_attr_t *restrict,
             size_t *restrict);
    int  posix_trace_attr_getmaxdatasize(const trace_attr_t *restrict,
             size_t *restrict);
    int  posix_trace_attr_getmaxsystemeventsize(const trace_attr_t *restrict,
             size_t *restrict);
    int  posix_trace_attr_getmaxusereventsize(const trace_attr_t *restrict,
             size_t, size_t *restrict);

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

NAME

ucontext.h — user context

SYNOPSIS

XSI
```
#include <ucontext.h>
```

DESCRIPTION

The **<ucontext.h>** header shall define the **mcontext_t** type through **typedef**.

The **<ucontext.h>** header shall define the **ucontext_t** type as a structure that shall include at least the following members:

`ucontext_t`	`*uc_link`	Pointer to the context that is resumed when this context returns.
`sigset_t`	`uc_sigmask`	The set of signals that are blocked when this context is active.
`stack_t`	`uc_stack`	The stack used by this context.
`mcontext_t`	`uc_mcontext`	A machine-specific representation of the saved context.

The types **sigset_t** and **stack_t** shall be defined as in **<signal.h>**.

The following shall be declared as functions and may also be defined as macros, Function prototypes shall be provided.

```
int  getcontext(ucontext_t *);
int  setcontext(const ucontext_t *);
void makecontext(ucontext_t *, void (*)(void), int, ...);
int  swapcontext(ucontext_t *restrict, const ucontext_t *restrict);
```

APPLICATION USAGE

NAME

ulimit.h — ulimit commands

SYNOPSIS

XSI

```
#include <ulimit.h>
```

DESCRIPTION

The **<ulimit.h>** header shall define the symbolic constants used by the *ulimit*( ) function.

Symbolic constants:

UL_GETFSIZE	Get maximum file size.
UL_SETFSIZE	Set maximum file size.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided. |

```
long ulimit(int, ...);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 3.

NAME

unistd.h — standard symbolic constants and types

SYNOPSIS

```
#include <unistd.h>
```

DESCRIPTION

The **<unistd.h>** header defines miscellaneous symbolic constants and types, and declares miscellaneous functions. The actual value of the constants are unspecified except as shown. The contents of this header are shown below.

Version Test Macros

The following symbolic constants shall be defined:

_POSIX_VERSION
Integer value indicating version of IEEE Std 1003.1 (C-language binding) to which the implementation conforms. For implementations conforming to IEEE Std 1003.1-200x, the value shall be 200xxxL.

_POSIX2_VERSION
Integer value indicating version of the Shell and Utilities volume of IEEE Std 1003.1 to which the implementation conforms. For implementations conforming to IEEE Std 1003.1-200x, the value shall be 200xxxL.

The following symbolic constant shall be defined only if the implementation supports the XSI option; see Section 2.1.4 (on page 19).

XSI _XOPEN_VERSION
Integer value indicating version of the X/Open Portability Guide to which the implementation conforms. The value shall be 600.

Constants for Options and Option Groups

The following symbolic constants, if defined in **<unistd.h>**, shall have a value of –1, 0, or greater, unless otherwise specified below. If these are undefined, the *fpathconf*( ), *pathconf*( ), or *sysconf*( ) functions can be used to determine whether the option is provided for a particular invocation of the application.

If a symbolic constant is defined with the value –1, the option is not supported. Headers, data types, and function interfaces required only for the option need not be supplied. An application that attempts to use anything associated only with the option is considered to be requiring an extension.

If a symbolic constant is defined with a value greater than zero, the option shall always be supported when the application is executed. All headers, data types, and functions shall be present and shall operate as specified.

If a symbolic constant is defined with the value zero, all headers, data types, and functions shall be present. The application can check at runtime to see whether the option is supported by calling *fpathconf*( ), *pathconf*( ), or *sysconf*( ) with the indicated *name* parameter.

Unless explicitly specified otherwise, the behavior of functions associated with an unsupported option is unspecified, and an application that uses such functions without first checking *fpathconf*( ), *pathconf*( ), or *sysconf*( ) is considered to be requiring an extension.

For conformance requirements, refer to Chapter 2 (on page 15).

ADV _POSIX_ADVISORY_INFO

The implementation supports the Advisory Information option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

AIO _POSIX_ASYNCHRONOUS_IO

The implementation supports the Asynchronous Input and Output option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

BAR _POSIX_BARRIERS

The implementation supports the Barriers option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

_POSIX_CHOWN_RESTRICTED

The use of *chown*( ) and *fchown*( ) is restricted to a process with appropriate privileges, and to changing the group ID of a file only to the effective group ID of the process or to one of its supplementary group IDs. This symbol shall always be set to a value other than –1.

CS _POSIX_CLOCK_SELECTION

The implementation supports the Clock Selection option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

CPT _POSIX_CPUTIME

The implementation supports the Process CPU-Time Clocks option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

FSC _POSIX_FSYNC

The implementation supports the File Synchronization option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

_POSIX_JOB_CONTROL

The implementation supports job control. This symbol shall always be set to a value greater than zero.

MF _POSIX_MAPPED_FILES

The implementation supports the Memory Mapped Files option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

ML _POSIX_MEMLOCK

The implementation supports the Process Memory Locking option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

MLR _POSIX_MEMLOCK_RANGE

The implementation supports the Range Memory Locking option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

MPR _POSIX_MEMORY_PROTECTION

The implementation supports the Memory Protection option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

MSG _POSIX_MESSAGE_PASSING

The implementation supports the Message Passing option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

MON _POSIX_MONOTONIC_CLOCK

The implementation supports the Monotonic Clock option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

_POSIX_NO_TRUNC

Pathname components longer than {NAME_MAX} generate an error. This symbol shall always be set to a value other than –1.

PIO _POSIX_PRIORITIZED_IO

The implementation supports the Prioritized Input and Output option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

PS _POSIX_PRIORITY_SCHEDULING

The implementation supports the Process Scheduling option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

RS _POSIX_RAW_SOCKETS

The implementation supports the Raw Sockets option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

THR _POSIX_READER_WRITER_LOCKS

The implementation supports the Read-Write Locks option. This is always set to a value greater than zero if the Threads option is supported. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

RTS _POSIX_REALTIME_SIGNALS

The implementation supports the Realtime Signals Extension option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

_POSIX_REGEXP

The implementation supports the Regular Expression Handling option. This symbol shall always be set to a value greater than zero.

_POSIX_SAVED_IDS

Each process has a saved set-user-ID and a saved set-group-ID. This symbol shall always be set to a value greater than zero.

SEM _POSIX_SEMAPHORES

The implementation supports the Semaphores option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

SHM _POSIX_SHARED_MEMORY_OBJECTS

The implementation supports the Shared Memory Objects option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

_POSIX_SHELL

The implementation supports the POSIX shell. This symbol shall always be set to a value greater than zero.

SPN _POSIX_SPAWN

The implementation supports the Spawn option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

SPI _POSIX_SPIN_LOCKS

The implementation supports the Spin Locks option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

SS _POSIX_SPORADIC_SERVER

The implementation supports the Process Sporadic Server option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

SIO _POSIX_SYNCHRONIZED_IO

The implementation supports the Synchronized Input and Output option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TSA _POSIX_THREAD_ATTR_STACKADDR

The implementation supports the Thread Stack Address Attribute option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TSS _POSIX_THREAD_ATTR_STACKSIZE

The implementation supports the Thread Stack Address Size option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TCT _POSIX_THREAD_CPUTIME

The implementation supports the Thread CPU-Time Clocks option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TPI _POSIX_THREAD_PRIO_INHERIT

The implementation supports the Thread Priority Inheritance option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TPP _POSIX_THREAD_PRIO_PROTECT

The implementation supports the Thread Priority Protection option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TPS _POSIX_THREAD_PRIORITY_SCHEDULING

The implementation supports the Thread Execution Scheduling option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TSH _POSIX_THREAD_PROCESS_SHARED

The implementation supports the Thread Process-Shared Synchronization option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TSF _POSIX_THREAD_SAFE_FUNCTIONS

The implementation supports the Thread-Safe Functions option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TSP _POSIX_THREAD_SPORADIC_SERVER

The implementation supports the Thread Sporadic Server option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

THR _POSIX_THREADS

The implementation supports the Threads option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TMO _POSIX_TIMEOUTS

The implementation supports the Timeouts option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TMR _POSIX_TIMERS

The implementation supports the Timers option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TRC _POSIX_TRACE

The implementation supports the Trace option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TEF _POSIX_TRACE_EVENT_FILTER

The implementation supports the Trace Event Filter option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TRI _POSIX_TRACE_INHERIT

The implementation supports the Trace Inherit option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TRL _POSIX_TRACE_LOG

The implementation supports the Trace Log option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

TYM _POSIX_TYPED_MEMORY_OBJECTS

The implementation supports the Typed Memory Objects option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

_POSIX_VDISABLE

This symbol shall be defined to be the value of a character that shall disable terminal special character handling as described in **<termios.h>**. This symbol shall always be set to a value other than –1.

_POSIX2_C_BIND

The implementation supports the C-Language Binding option. This symbol shall always have the value 200xxxL.

CD _POSIX2_C_DEV

The implementation supports the C-Language Development Utilities option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

_POSIX2_CHAR_TERM

The implementation supports at least one terminal type.

FD _POSIX2_FORT_DEV

The implementation supports the FORTRAN Development Utilities option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

FR _POSIX2_FORT_RUN

The implementation supports the FORTRAN Runtime Utilities option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

_POSIX2_LOCALEDEF

The implementation supports the creation of locales by the *localedef* utility. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

BE _POSIX2_PBS

The implementation supports the Batch Environment Services and Utilities option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

BE _POSIX2_PBS_ACCOUNTING

The implementation supports the Batch Accounting option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

BE _POSIX2_PBS_CHECKPOINT

The implementation supports the Batch Checkpoint/Restart option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

BE _POSIX2_PBS_LOCATE

The implementation supports the Locate Batch Job Request option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

BE _POSIX2_PBS_MESSAGE

The implementation supports the Batch Job Message Request option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

BE _POSIX2_PBS_TRACK

The implementation supports the Track Batch Job Request option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

SD _POSIX2_SW_DEV

The implementation supports the Software Development Utilities option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

UP _POSIX2_UPE

The implementation supports the User Portability Utilities option. If this symbol has a value other than –1 or 0, it shall have the value 200xxxL.

_V6_ILP32_OFF32

The implementation provides a C-language compilation environment with 32-bit **int**, **long**, **pointer**, and **off_t** types.

_V6_ILP32_OFFBIG

The implementation provides a C-language compilation environment with 32-bit **int**, **long**, and **pointer** types and an **off_t** type using at least 64 bits.

_V6_LP64_OFF64

The implementation provides a C-language compilation environment with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t** types.

_V6_LPBIG_OFFBIG

The implementation provides a C-language compilation environment with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

XSI _XBS5_ILP32_OFF32 (**LEGACY**)

The implementation provides a C-language compilation environment with 32-bit **int**, **long**, **pointer**, and **off_t** types.

XSI _XBS5_ILP32_OFFBIG (**LEGACY**)

The implementation provides a C-language compilation environment with 32-bit **int**, **long**, and **pointer** types and an **off_t** type using at least 64 bits.

XSI _XBS5_LP64_OFF64 (**LEGACY**)

The implementation provides a C-language compilation environment with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t** types.

XSI _XBS5_LPBIG_OFFBIG (**LEGACY**)

The implementation provides a C-language compilation environment with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

XSI _XOPEN_CRYPT

The implementation supports the X/Open Encryption Option Group.

_XOPEN_ENH_I18N

The implementation supports the Issue 4, Version 2 Enhanced Internationalization Option Group. This symbol shall always be set to a value other than –1.

_XOPEN_LEGACY

The implementation supports the Legacy Option Group.

_XOPEN_REALTIME

The implementation supports the X/Open Realtime Option Group.

_XOPEN_REALTIME_THREADS

The implementation supports the X/Open Realtime Threads Option Group.

_XOPEN_SHM

The implementation supports the Issue 4, Version 2 Shared Memory Option Group. This symbol shall always be set to a value other than –1.

_XOPEN_STREAMS
The implementation supports the XSI STREAMS Option Group.

XSI _XOPEN_UNIX
The implementation supports the XSI extension.

Execution-Time Symbolic Constants

If any of the following constants are not defined in the **<unistd.h>** header, the value shall vary depending on the file to which it is applied.

If any of the following constants are defined to have value −1 in the **<unistd.h>** header, the implementation shall not provide the option on any file; if any are defined to have a value other than −1 in the **<unistd.h>** header, the implementation shall provide the option on all applicable files.

All of the following constants, whether defined in **<unistd.h>** or not, may be queried with respect to a specific file using the *pathconf*( ) or *fpathconf*( ) functions:

_POSIX_ASYNC_IO
Asynchronous input or output operations may be performed for the associated file.

_POSIX_PRIO_IO
Prioritized input or output operations may be performed for the associated file.

_POSIX_SYNC_IO
Synchronized input or output operations may be performed for the associated file.

Constants for Functions

The following symbolic constant shall be defined:

NULL	Null pointer

The following symbolic constants shall be defined for the *access*( ) function:

F_OK	Test for existence of file.
R_OK	Test for read permission.
W_OK	Test for write permission.
X_OK	Test for execute (search) permission.

The constants F_OK, R_OK, W_OK, and X_OK and the expressions *R_OK* | *W_OK*, *R_OK* | *X_OK*, and *R_OK* | *W_OK* | *X_OK* shall all have distinct values.

The following symbolic constants shall be defined for the *confstr*( ) function:

_CS_POSIX_PATH
This is the value for the *PATH* environment variable that finds all standard utilities.

_CS_POSIX_V6_ILP32_OFF32_CFLAGS
If *sysconf*(_SC_V6_ILP32_OFF32) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of initial options to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_POSIX_V6_ILP32_OFF32_LDFLAGS
If *sysconf*(_SC_V6_ILP32_OFF32) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of final options to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_POSIX_V6_ILP32_OFF32_LIBS

If *sysconf*(_SC_V6_ILP32_OFF32) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of libraries to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_POSIX_V6_ILP32_OFF32_LINTFLAGS

If *sysconf*(_SC_V6_ILP32_OFF32) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of options to be given to the *lint* utility to check application source using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_POSIX_V6_ILP32_OFFBIG_CFLAGS

If *sysconf*(_SC_V6_ILP32_OFFBIG) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of initial options to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an **off_t** type using at least 64 bits.

_CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS

If *sysconf*(_SC_V6_ILP32_OFFBIG) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of final options to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an **off_t** type using at least 64 bits.

_CS_POSIX_V6_ILP32_OFFBIG_LIBS

If *sysconf*(_SC_V6_ILP32_OFFBIG) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of libraries to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an **off_t** type using at least 64 bits.

_CS_POSIX_V6_ILP32_OFFBIG_LINTFLAGS

If *sysconf*(_SC_V6_ILP32_OFFBIG) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of options to be given to the *lint* utility to check an application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an **off_t** type using at least 64 bits.

_CS_POSIX_V6_LP64_OFF64_CFLAGS

If *sysconf*(_SC_V6_LP64_OFF64) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of initial options to be given to the *cc* and *c99* utilities to build an application using a programming model with 64-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_POSIX_V6_LP64_OFF64_LDFLAGS

If *sysconf*(_SC_V6_LP64_OFF64) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of final options to be given to the *cc* and *c99* utilities to build an application using a programming model with 64-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_POSIX_V6_LP64_OFF64_LIBS

If *sysconf*(_SC_V6_LP64_OFF64) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of libraries to be given to the *cc* and *c99* utilities to build an application using a programming model with 64-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_POSIX_V6_LP64_OFF64_LINTFLAGS

If *sysconf*(_SC_V6_LP64_OFF64) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of options to be given to the *lint* utility to check application source using a programming model with 64-bit **int**, **long**, **pointer**, and **off_t** types.

_CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS

If *sysconf*(_SC_V6_LPBIG_OFFBIG) returns −1, the meaning of this value is unspecified.

Otherwise, this value is the set of initial options to be given to the *cc* and *c99* utilities to build an application using a programming model with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

_CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS

If *sysconf*(_SC_V6_LPBIG_OFFBIG) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of final options to be given to the *cc* and *c99* utilities to build an application using a programming model with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

_CS_POSIX_V6_LPBIG_OFFBIG_LIBS

If *sysconf*(_SC_V6_LPBIG_OFFBIG) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of libraries to be given to the *cc* and *c99* utilities to build an application using a programming model with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

_CS_POSIX_V6_LPBIG_OFFBIG_LINTFLAGS

If *sysconf*(_SC_V6_LPBIG_OFFBIG) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of options to be given to the *lint* utility to check application source using a programming model with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

_CS_V6_WIDTH_RESTRICTED_ENVS

This value is a <newline>-separated list of names of programming environments supported by the implementation in which the widths of the **blksize_t**, **cc_t**, **mode_t**, **nfds_t**, **pid_t**, **ptrdiff_t**, **size_t**, **speed_t**, **ssize_t**, **suseconds_t**, **tcflag_t**, **useconds_t**, **wchar_t**, and **wint_t** types are no greater than the width of type **long**.

XSI _CS_XBS5_ILP32_OFF32_CFLAGS (**LEGACY**)

If *sysconf*(_SC_XBS5_ILP32_OFF32) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of initial options to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

XSI _CS_XBS5_ILP32_OFF32_LDFLAGS (**LEGACY**)

If *sysconf*(_SC_XBS5_ILP32_OFF32) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of final options to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

XSI _CS_XBS5_ILP32_OFF32_LIBS (**LEGACY**)

If *sysconf*(_SC_XBS5_ILP32_OFF32) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of libraries to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

XSI _CS_XBS5_ILP32_OFF32_LINTFLAGS (**LEGACY**)

If *sysconf*(_SC_XBS5_ILP32_OFF32) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of options to be given to the *lint* utility to check application source using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

XSI _CS_XBS5_ILP32_OFFBIG_CFLAGS (**LEGACY**)

If *sysconf*(_SC_XBS5_ILP32_OFFBIG) returns −1, the meaning of this value is unspecified. Otherwise, this value is the set of initial options to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an **off_t** type using at least 64 bits.

XSI _CS_XBS5_ILP32_OFFBIG_LDFLAGS (**LEGACY**)

If *sysconf*(_SC_XBS5_ILP32_OFFBIG) returns −1, the meaning of this value is unspecified.

Otherwise, this value is the set of final options to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an **off_t** type using at least 64 bits.

XSI _CS_XBS5_ILP32_OFFBIG_LIBS (**LEGACY**)
If *sysconf*(_SC_XBS5_ILP32_OFFBIG) returns –1, the meaning of this value is unspecified. Otherwise, this value is the set of libraries to be given to the *cc* and *c99* utilities to build an application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an **off_t** type using at least 64 bits.

If *sysconf*(_SC_XBS5_LPBIG_OFFBIG) returns –1, the meaning of this value is unspecified.

Otherwise, this value is the set of options to be given to the *lint* utility to check application source using a programming model with an **int** type using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

The following symbolic constants shall be defined for the *lseek*( ) and *fcntl*( ) functions and shall have distinct values:

SEEK_CUR	Set file offset to current plus *offset*.
SEEK_END	Set file offset to EOF plus *offset*.
SEEK_SET	Set file offset to *offset*.

The following symbolic constants shall be defined as possible values for the *function* argument to the *lockf*( ) function:

F_LOCK	Lock a section for exclusive use.
F_TEST	Test section for locks by other processes.
F_TLOCK	Test and lock a section for exclusive use.
F_ULOCK	Unlock locked sections.

The following symbolic constants shall be defined for *pathconf*( ):

ADV _PC_ALLOC_SIZE_MIN
AIO _PC_ASYNC_IO
_PC_CHOWN_RESTRICTED

The two constants _SC_PAGESIZE and _SC_PAGE_SIZE may be defined to have the same value.

The following symbolic constants shall be defined for file streams:

STDERR_FILENO	File number of *stderr*; 2.
STDIN_FILENO	File number of *stdin*; 0.
STDOUT_FILENO	File number of *stdout*; 1.

Type Definitions

The **size_t**, **ssize_t**, **uid_t**, **gid_t**, **off_t**, and **pid_t** types shall be defined as described in **<sys/types.h>**.

The **useconds_t** type shall be defined as described in **<sys/types.h>**.

The **intptr_t** type shall be defined as described in **<inttypes.h>**.

Declarations

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int          access(const char *, int);
unsigned     alarm(unsigned);
int          chdir(const char *);
int          chown(const char *, uid_t, gid_t);
int          close(int);
size_t       confstr(int, char *, size_t);
char        *crypt(const char *, const char *);
char        *ctermid(char *);
int          dup(int);
```

```

XSI int           nice(int);
    long          pathconf(const char *, int);
    int           pause(void);
    int           pipe(int [2]);
XSI ssize_t       pread(int, void *, size_t, off_t);
    ssize_t       pwrite(int, const void *, size_t, off_t);
    ssize_t       read(int, void *, size_t);
    ssize_t       readlink(const char *restrict, char *restrict, size_t);
    int           rmdir(const char *);
    int           setegid(gid_t);
    int           seteuid(uid_t);
    int           setgid(gid_t);
```

```
int          setpgid(pid_t, pid_t);
pid_t        setpgrp(void);
int          setregid(gid_t, gid_t);
int          setreuid(uid_t, uid_t);
pid_t        setsid(void);
int          setuid(uid_t);
unsigned     sleep(unsigned);
void         swab(const void *restrict, void *restrict, ssize_t);
int          symlink(const char *, const char *);
void         sync(void);
long         sysconf(int);
pid_t        tcgetpgrp(int);
int          tcsetpgrp(int, pid_t);
int          truncate(const char *, off_t);
char        *ttyname(int);
int          ttyname_r(int, char *, size_t);
useconds_t   ualarm(useconds_t, useconds_t);
int          unlink(const char *);
int          usleep(useconds_t);
pid_t        vfork(void);
ssize_t      write(int, const void *, size_t);
```

Implementations may also include the *pthread_atfork*( ) prototype as defined in **<pthread.h>** (on page 286).

The following external variables shall be declared:

```
extern char   *optarg;
extern int    optind, opterr, optopt;
```

APPLICATION USAGE

IEEE Std 1003.1-200x only describes the behavior of systems that claim conformance to it. However, application developers who want to write applications that adapt to other versions of IEEE Std 1003.1 (or to systems that do not conform to any POSIX standard) may find it useful to code them so as to conditionally compile different code depending on the value of _POSIX_VERSION, for example.

```
#if _POSIX_VERSION == 200xxxL
/* Use the newer function that copes with large files. */
off_t pos=ftello(fp);
#else
/* Either this is an old version of POSIX, or _POSIX_VERSION is
   not even defined, so use the traditional function. */
long pos=ftell(fp);
#endif
```

Earlier versions of IEEE Std 1003.1 and of the Single UNIX Specification can be identified by the following macros:

POSIX.1-1988 standard
    _POSIX_VERSION==198808L

POSIX.1-1990 standard
    _POSIX_VERSION==199009L

ISO POSIX-1: 1996 standard
    _POSIX_VERSION==199506L

Single UNIX Specification, Version 1
_XOPEN_UNIX and _XOPEN_VERSION= =4

Single UNIX Specification, Version 2
_XOPEN_UNIX and _XOPEN_VERSION= =500

IEEE Std 1003.1-200x does not make any attempt to define application binary interaction with the underlying operating system. However, application developers may find it useful to query _SC_VERSION at runtime via *sysconf*( ) to determine whether the current version of the operating system supports the necessary functionality as in the following program fragment:

```
if (sysconf(_SC_VERSION) < 200xxxL) {
    fprintf(stderr, "POSIX.1-200x system required, terminating \n");
    exit(1);
}
```

RATIONALE

As IEEE Std 1003.1-200x evolved, certain options became sufficiently standardized that it was concluded that simply requiring one of the option choices was simpler than retaining the option. However, for backwards compatibility, the option flags (with required constant values) are retained.

Version Test Macros

The standard developers considered altering the definition of _POSIX_VERSION and removing _SC_VERSION from the specification of *sysconf*( ) since the utility to an application was deemed by some to be minimal, and since the implementation of the functionality is potentially problematic. However, they recognized that support for existing application binaries is a concern to manufacturers, application developers, and the users of implementations conforming to IEEE Std 1003.1-200x.

While the example using _SC_VERSION in the APPLICATION USAGE section does not provide the greatest degree of imaginable utility to the application developer or user, it is arguably better than a core dump or some other equally obscure result. (It is also possible for implementations to encode and recognize application binaries compiled in various POSIX.1-conforming environments, and modify the semantics of the underlying system to conform to the expectations of the application.) For the reasons outlined in the preceding paragraphs and in the APPLICATION USAGE section, the standard developers elected to retain the _POSIX_VERSION and _SC_VERSION functionality.

Compile-Time Symbolic Constants for System-Wide Options

IEEE Std 1003.1-200x now includes support in certain areas for the newly adopted policy governing options and stubs.

This policy provides flexibility for implementations in how they support options. It also specifies how conforming applications can adapt to different implementations that support different sets of options. It allows the following:

1. If an implementation has no interest in supporting an option, it does not have to provide anything associated with that option beyond the announcement that it does not support it.

2. An implementation can support a partial or incompatible version of an option (as a non-standard extension) as long as it does not claim to support the option.

3. An application can determine whether the option is supported. A strictly conforming application must check this announcement mechanism before first using anything associated with the option.

There is an important implication of this policy. IEEE Std 1003.1-200x cannot dictate the behavior of interfaces associated with an option when the implementation does not claim to support the option. In particular, it cannot require that a function associated with an unsupported option will fail if it does not perform as specified. However, this policy does not prevent a standard from requiring certain functions to always be present, but that they shall always fail on some implementations. The *setpgid*( ) function in the POSIX.1-1990 standard, for example, is considered appropriate.

The POSIX standards include various options, and the C language binding support for an option implies that the implementation must supply data types and function interfaces. An application must be able to discover whether the implementation supports each option.

Any application must consider the following three cases for each option:

1. Option never supported.

   The implementation advertises at compile time that the option will never be supported. In this case, it is not necessary for the implementation to supply any of the data types or function interfaces that are provided only as part of the option. The implementation might provide data types and functions that are similar to those defined by IEEE Std 1003.1-200x, but there is no guarantee for any particular behavior.

2. Option always supported.

   The implementation advertises at compile time that the option will always be supported. In this case, all data types and function interfaces shall be available and shall operate as specified.

3. Option might or might not be supported.

   Some implementations might not provide a mechanism to specify support of options at compile time. In addition, the implementation might be unable or unwilling to specify support or non-support at compile time. In either case, any application that might use the option at runtime must be able to compile and execute. The implementation must provide, at compile time, all data types and function interfaces that are necessary to allow this. In this situation, there must be a mechanism that allows the application to query, at runtime, whether the option is supported. If the application attempts to use the option when it is not supported, the result is unspecified unless explicitly specified otherwise in IEEE Std 1003.1-200x.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

The symbolic constants _XOPEN_REALTIME and _XOPEN_REALTIME_THREADS are added. _POSIX2_C_BIND, _XOPEN_ENH_I18N, and _XOPEN_SHM must now be set to a value other than −1 by a conforming implementation.

Large File System extensions are added.

The type of the argument to *sbrk*( ) is changed from **int** to **intptr_t**.

XBS constants are added to the list of constants for Options and Option Groups, to the list of constants for the *confstr*( ) function, and to the list of constants to the *sysconf*( ) function. These are all marked EX.

Issue 6

_POSIX2_C_VERSION is removed.

The Open Group Corrigendum U026/4 is applied, adding the prototype for *fdatasync*( ).

The Open Group Corrigendum U026/1 is applied, adding the symbols _SC_XOPEN_LEGACY, _SC_XOPEN_REALTIME, and _SC_XOPEN_REALTIME_THREADS.

The symbols _XOPEN_STREAMS and _SC_XOPEN_STREAMS are added to support the XSI STREAMS Option Group.

Text in the DESCRIPTION relating to conformance requirements is moved elsewhere in IEEE Std 1003.1-200x. |

The legacy symbol _SC_PASS_MAX is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The _CS_POSIX_* and _CS_XBS5_* constants are added for the *confstr*( ) function. |
- The _SC_XBS5_* constants are added for the *sysconf*( ) function.
- The symbolic constants F_ULOCK, F_LOCK, F_TLOCK, and F_TEST are added.
- The **uid_t**, **gid_t**, **off_t**, **pid_t**, and **useconds_t** types are mandated.

The *gethostname*( ) prototype is added for sockets.

New section added for System Wide Options.

Function prototypes for *setegid*( ) and *seteuid*( ) are added.

Option symbolic constants are added for _POSIX_ADVISORY_INFO, _POSIX_CPUTIME, | _POSIX_SPAWN, _POSIX_SPORADIC_SERVER, _POSIX_THREAD_CPUTIME, _POSIX_THREAD_SPORADIC_SERVER, and _POSIX_TIMEOUTS, and *pathconf*( ) variables are added for _PC_ALLOC_SIZE_MIN, _PC_REC_INCR_XFER_SIZE, _PC_REC_MAX_XFER_SIZE, _PC_REC_MIN_XFER_SIZE, and _PC_REC_XFER_ALIGN for alignment with IEEE Std 1003.1d-1999. |

The following are added for alignment with IEEE Std 1003.1j-2000:

- Option symbolic constants _POSIX_BARRIERS, _POSIX_CLOCK_SELECTION, _POSIX_MONOTONIC_CLOCK, _POSIX_READER_WRITER_LOCKS, _POSIX_SPIN_LOCKS, and _POSIX_TYPED_MEMORY_OBJECTS

- *sysconf*( ) variables _SC_BARRIERS, _SC_CLOCK_SELECTION, _SC_MONOTONIC_CLOCK, _SC_READER_WRITER_LOCKS, _SC_SPIN_LOCKS, and _SC_TYPED_MEMORY_OBJECTS

The _SC_XBS5 macros associated with the ISO/IEC 9899:1990 standard are marked LEGACY, and new equivalent _SC_V6 macros associated with the ISO/IEC 9899:1999 standard are introduced.

The *getwd*( ) function is marked LEGACY.

The **restrict** keyword is added to the prototypes for *readlink*( ) and *swab*( ).

Constants for options are now harmonized, so when supported they take the year of approval of IEEE Std 1003.1-200x as the value.

The following are added for alignment with IEEE Std 1003.1q-2000:

- Optional symbolic constants _POSIX_TRACE, _POSIX_TRACE_EVENT_FILTER, _POSIX_TRACE_LOG, and _POSIX_TRACE_INHERIT
- The *sysconf*( ) symbolic constants _SC_TRACE, _SC_TRACE_EVENT_FILTER, _SC_TRACE_LOG, and _SC_TRACE_INHERIT.

The *brk*( ) and *sbrk*( ) legacy functions are removed.

The Open Group Base Resolution bwg2001-006 is applied, which reworks the XSI versioning information.

The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter for *gethostname*( ) from **socklen_t** to **size_t**.

<utime.h>

NAME

utime.h — access and modification times structure

SYNOPSIS

```
#include <utime.h>
```

DESCRIPTION

The **<utime.h>** header shall declare the structure **utimbuf**, which shall include the following members:

```
time_t    actime     Access time.
time_t    modtime    Modification time.
```

The times shall be measured in seconds since the Epoch.

The type **time_t** shall be defined as described in **<sys/types.h>**.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided. |

```
int utime(const char *, const struct utimbuf *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The **time_t** type is defined.

NAME

utmpx.h — user accounting database definitions

SYNOPSIS

XSI
```
#include <utmpx.h>
```

DESCRIPTION

The **<utmpx.h>** header shall define the **utmpx** structure that shall include at least the following members:

`char`	`ut_user[]`	User login name.
`char`	`ut_id[]`	Unspecified initialization process identifier.
`char`	`ut_line[]`	Device name.
`pid_t`	`ut_pid`	Process ID.
`short`	`ut_type`	Type of entry.
`struct timeval`	`ut_tv`	Time entry was made.

The **pid_t** type shall be defined through **typedef** as described in **<sys/types.h>**.

The **timeval** structure shall be defined as described in **<sys/time.h>**.

Inclusion of the **<utmpx.h>** header may also make visible all symbols from **<sys/time.h>**.

The following symbolic constants shall be defined as possible values for the *ut_type* member of the **utmpx** structure:

EMPTY	No valid user accounting information.
BOOT_TIME	Identifies time of system boot.
OLD_TIME	Identifies time when system clock changed.
NEW_TIME	Identifies time after system clock changed.
USER_PROCESS	Identifies a process.
INIT_PROCESS	Identifies a process spawned by the init process.
LOGIN_PROCESS	Identifies the session leader of a logged in user.
DEAD_PROCESS	Identifies a session leader who has exited.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
void          endutxent(void);
struct utmpx *getutxent(void);
struct utmpx *getutxid(const struct utmpx *);
struct utmpx *getutxline(const struct utmpx *);
struct utmpx *pututxline(const struct utmpx *);
void          setutxent(void);
```

APPLICATION USAGE

None.

RATIONALE

CHANGE HISTORY

First released in Issue 4, Version 2.

NAME

wchar.h — wide-character handling

SYNOPSIS

```
#include <wchar.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of these symbols in this header.

The **<wchar.h>** header shall define the following types:

wchar_t	As described in **<stddef.h>**.
wint_t	An integer type capable of storing any valid value of **wchar_t** or WEOF.
XSI **wctype_t**	A scalar type of a data object that can hold values which represent locale-specific character classification.
mbstate_t	An object type other than an array type that can hold the conversion state information necessary to convert between sequences of (possibly multi-byte) characters and wide characters. XSI If a codeset is being used such that an **mbstate_t** needs to preserve more than 2 levels of reserved state, the results are unspecified.
XSI **FILE**	As described in **<stdio.h>**.
size_t	As described in **<stddef.h>**.
XSI **va_list**	As described in **<stdarg.h>**.

The implementation shall support one or more programming environments in which the width of **wint_t** is no greater than the width of type **long**. The names of these programming environments can be obtained using the *confstr*( ) function or the *getconf* utility.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
wint_t        btowc(int);
wint_t        fgetwc(FILE *);
wchar_t      *fgetws(wchar_t *restrict, int, FILE *restrict);
wint_t        fputwc(wchar_t, FILE *);
int           fputws(const wchar_t *restrict, FILE *restrict);
int           fwide(FILE *, int);
int           fwprintf(FILE *restrict, const wchar_t *restrict, ...);
int           fwscanf(FILE *restrict, const wchar_t *restrict, ...);
wint_t        getwc(FILE *);
wint_t        getwchar(void);
```

XSI

```
int           iswalnum(wint_t);
int           iswalpha(wint_t);
int           iswcntrl(wint_t);
int           iswctype(wint_t, wctype_t);
int           iswdigit(wint_t);
int           iswgraph(wint_t);
int           iswlower(wint_t);
int           iswprint(wint_t);
int           iswpunct(wint_t);
```

```
    int           iswspace(wint_t);
    int           iswupper(wint_t);
    int           iswxdigit(wint_t);
    size_t        mbrlen(const char *restrict, size_t, mbstate_t *restrict);
    size_t        mbrtowc(wchar_t *restrict, const char *restrict, size_t,
                      mbstate_t *restrict);
    int           mbsinit(const mbstate_t *);
    size_t        mbsrtowcs(wchar_t *restrict, const char **restrict, size_t,
                      mbstate_t *restrict);
    wint_t        putwc(wchar_t, FILE *);
    wint_t        putwchar(wchar_t);
    int           swprintf(wchar_t *restrict, size_t,
                      const wchar_t *restrict, ...);
    int           swscanf(const wchar_t *restrict,
                      const wchar_t *restrict, ...);
XSI wint_t        towlower(wint_t);
    wint_t        towupper(wint_t);
    wint_t        ungetwc(wint_t, FILE *);
    int           vfwprintf(FILE *restrict, const wchar_t *restrict, va_list);
    int           vfwscanf(FILE *restrict, const wchar_t *restrict, va_list);
    int           vwprintf(const wchar_t *restrict, va_list);
    int           vswprintf(wchar_t *restrict, size_t,
                      const wchar_t *restrict, va_list);
    int           vswscanf(const wchar_t *restrict, const wchar_t *restrict,
                      va_list);
    int           vwscanf(const wchar_t *restrict, va_list);
    size_t        wcrtomb(char *restrict, wchar_t, mbstate_t *restrict);
    wchar_t      *wcscat(wchar_t *restrict, const wchar_t *restrict);
    wchar_t      *wcschr(const wchar_t *, wchar_t);
    int           wcscmp(const wchar_t *, const wchar_t *);
    int           wcscoll(const wchar_t *, const wchar_t *);
    wchar_t      *wcscpy(wchar_t *restrict, const wchar_t *restrict);
    size_t        wcscspn(const wchar_t *, const wchar_t *);
    size_t        wcsftime(wchar_t *restrict, size_t,
                      const wchar_t *restrict, const struct tm *restrict);
    size_t        wcslen(const wchar_t *);
    wchar_t      *wcsncat(wchar_t *restrict, const wchar_t *restrict, size_t);
    int           wcsncmp(const wchar_t *, const wchar_t *, size_t);
    wchar_t      *wcsncpy(wchar_t *restrict, const wchar_t *restrict, size_t);
    wchar_t      *wcspbrk(const wchar_t *, const wchar_t *);
    wchar_t      *wcsrchr(const wchar_t *, wchar_t);
    size_t        wcsrtombs(char *restrict, const wchar_t **restrict,
                      size_t, mbstate_t *restrict);
    size_t        wcsspn(const wchar_t *, const wchar_t *);
    wchar_t      *wcsstr(const wchar_t *restrict, const wchar_t *restrict);
    double        wcstod(const wchar_t *restrict, wchar_t **restrict);
    float         wcstof(const wchar_t *restrict, wchar_t **restrict);
    wchar_t      *wcstok(wchar_t *restrict, const wchar_t *restrict,
                      wchar_t **restrict);
    long          wcstol(const wchar_t *restrict, wchar_t **restrict, int);
    long double   wcstold(const wchar_t *restrict, wchar_t **restrict);
    long long     wcstoll(const wchar_t *restrict, wchar_t **restrict, int);
```

```
unsigned long wcstoul(const wchar_t *restrict, wchar_t **restrict, int);
unsigned long long
              wcstoull(const wchar_t *restrict, wchar_t **restrict, int);
wchar_t      *wcswcs(const wchar_t *, const wchar_t *);
int           wcswidth(const wchar_t *, size_t);
size_t        wcsxfrm(wchar_t *restrict, const wchar_t *restrict, size_t);
int           wctob(wint_t);
wctype_t      wctype(const char *);
int           wcwidth(wchar_t);
wchar_t      *wmemchr(const wchar_t *, wchar_t, size_t);
int           wmemcmp(const wchar_t *, const wchar_t *, size_t);
wchar_t      *wmemcpy(wchar_t *restrict, const wchar_t *restrict, size_t);
wchar_t      *wmemmove(wchar_t *, const wchar_t *, size_t);
wchar_t      *wmemset(wchar_t *, wchar_t, size_t);
int           wprintf(const wchar_t *restrict, ...);
int           wscanf(const wchar_t *restrict, ...);
```

The **<wchar.h>** header shall define the following macros:

WCHAR_MAX	The maximum value representable by an object of type **wchar_t**.
WCHAR_MIN	The minimum value representable by an object of type **wchar_t**.
WEOF	Constant expression of type **wint_t** that is returned by several WP functions to indicate end-of-file.
NULL	As described in **<stddef.h>**.

The tag **tm** shall be declared as naming an incomplete structure type, the contents of which are described in the header **<time.h>**.

Inclusion of the **<wchar.h>** header may make visible all symbols from the headers **<ctype.h>**, **<stdio.h>**, **<stdarg.h>**, **<stdlib.h>**, **<string.h>**, **<stddef.h>**, and **<time.h>**.

APPLICATION USAGE

None.

RATIONALE

In the ISO C standard, the symbols referenced as XSI extensions are in **<wctype.h>**. Their presence here is thus an extension.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4.

Issue 5

Aligned with the ISO / IEC 9899: 1990 / Amendment 1: 1995 (E).

Issue 6

The Open Group Corrigendum U021/10 is applied. The prototypes for *wcswidth*( ) and *wcwidth*( ) are marked as extensions.

The Open Group Corrigendum U028/5 is applied, correcting the prototype for the *mbsinit*( ) function.

The following changes are made for alignment with the ISO / IEC 9899: 1999 standard:

- Various function prototypes are updated to add the **restrict** keyword.
- The functions *vfwscanf*( ), *vswscanf*( ), *wcstof*( ), *wcstold*( ), *wcstoll*( ), and *wcstoull*( ) are added.

The type **wctype_t**, the *isw**( ), *to**( ), and *wctype*( ) functions are marked as XSI extensions.

NAME

wctype.h — wide-character classification and mapping utilities

SYNOPSIS

```
#include <wctype.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see the System Interfaces volume of IEEE Std 1003.1-200x, Section 2.2, The Compilation Environment) to enable the visibility of these symbols in this header.

The **<wctype.h>** header shall define the following types:

wint_t	As described in **<wchar.h>**.
wctrans_t	A scalar type that can hold values which represent locale-specific character mappings.
wctype_t	As described in **<wchar.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided. |

```
int        iswalnum(wint_t);
int        iswalpha(wint_t);
int        iswblank(wint_t);
int        iswcntrl(wint_t);
int        iswdigit(wint_t);
int        iswgraph(wint_t);
int        iswlower(wint_t);
int        iswprint(wint_t);
int        iswpunct(wint_t);
int        iswspace(wint_t);
int        iswupper(wint_t);
int        iswxdigit(wint_t);
int        iswctype(wint_t, wctype_t);
wint_t     towctrans(wint_t, wctrans_t);
wint_t     towlower(wint_t);
wint_t     towupper(wint_t);
wctrans_t wctrans(const char *);
wctype_t  wctype(const char *);
```

The **<wctype.h>** header shall define the following macro name:

WEOF	Constant expression of type **wint_t** that is returned by several MSE functions to indicate end-of-file.

For all functions described in this header that accept an argument of type **wint_t**, the value is representable as a **wchar_t** or equals the value of WEOF. If this argument has any other value, the behavior is undefined.

The behavior of these functions shall be affected by the *LC_CTYPE* category of the current locale.

CX Inclusion of the **<wctype.h>** header may make visible all symbols from the headers **<ctype.h>**, **<stdio.h>**, **<stdarg.h>**, **<stdlib.h>**, **<string.h>**, **<stddef.h>**, **<time.h>**, and **<wchar.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<locale.h>, **<wchar.h>**, the System Interfaces volume of IEEE Std 1003.1-200x, *iswalnum*( ), *iswalpha*( ), *iswblank*( ), *iswcntrl*( ), *iswctype*( ), *iswdigit*( ), *iswgraph*( ), *iswlower*( ), *iswprint*( ), *iswpunct*( ), *iswspace*( ), *iswupper*( ), *iswxdigit*( ), *setlocale*( ), *towctrans*( ), *towlower*( ), *towupper*( ), *wctrans*( ), *wctype*( )

CHANGE HISTORY

First released in Issue 5. Derived from the ISO/IEC 9899: 1990/Amendment 1: 1995 (E).

Issue 6

The *iswblank*( ) function is added for alignment with the ISO/IEC 9899: 1999 standard.

NAME

wordexp.h — word-expansion types

SYNOPSIS

```
#include <wordexp.h>
```

DESCRIPTION

The **<wordexp.h>** header shall define the structures and symbolic constants used by the *wordexp*( ) and *wordfree*( ) functions.

The structure type **wordexp_t** shall contain at least the following members:

`size_t`	`we_wordc`	Count of words matched by *words*.
`char`	`**we_wordv`	Pointer to list of expanded words.
`size_t`	`we_offs`	Slots to reserve at the beginning of *we_wordv*.

The *flags* argument to the *wordexp*( ) function shall be the bitwise-inclusive OR of the following flags:

WRDE_APPEND	Append words to those previously generated.
WRDE_DOOFFS	Number of null pointers to prepend to *we_wordv*.
WRDE_NOCMD	Fail if command substitution is requested.
WRDE_REUSE	The *pwordexp* argument was passed to a previous successful call to *wordexp*( ), and has not been passed to *wordfree*( ). The result is the same as if the application had called *wordfree*( ) and then called *wordexp*( ) without WRDE_REUSE.
WRDE_SHOWERR	Do not redirect *stderr* to **/dev/null**.
WRDE_UNDEF	Report error on an attempt to expand an undefined shell variable.

The following constants shall be defined as error return values:

WRDE_BADCHAR	One of the unquoted characters—<newline>, `'|'`, `'&'`, `';'`, `'<'`, `'>'`, `'('`, `')'`, `'{'`, `'}'`—appears in *words* in an inappropriate context.
WRDE_BADVAL	Reference to undefined shell variable when WRDE_UNDEF is set in *flags*.
WRDE_CMDSUB	Command substitution requested when WRDE_NOCMD was set in flags.
WRDE_NOSPACE	Attempt to allocate memory failed.
OB XSI WRDE_NOSYS	Reserved.
WRDE_SYNTAX	Shell syntax error, such as unbalanced parentheses or unterminated string.

The **<wordexp.h>** header shall define the following type:

XSI **size_t**	As described in **<stddef.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int  wordexp(const char *restrict, wordexp_t *restrict, int);
void wordfree(wordexp_t *);
```

The implementation may define additional macros or constants using names beginning with WRDE_.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<stddef.h>, the System Interfaces volume of IEEE Std 1003.1-200x, *wordexp*( ), the Shell and Utilities volume of IEEE Std 1003.1-200x |

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 6

The **restrict** keyword is added to the prototype for *wordexp*( ).

The WRDE_NOSYS constant is marked obsolescent.

Index

Chapter 1

Introduction

1.1 Scope

The scope of IEEE Std 1003.1-200x is described in the Base Definitions volume of IEEE Std 1003.1-200x.

1.2 Conformance

Conformance requirements for IEEE Std 1003.1-200x are defined in the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 2, Conformance.

1.3 Normative References

Normative references for IEEE Std 1003.1-200x are defined in the Base Definitions volume of IEEE Std 1003.1-200x.

1.4 Change History

Change history is described in the Rationale (Informative) volume of IEEE Std 1003.1-200x, and in the CHANGE HISTORY section of reference pages.

1.5 Terminology

This section appears in the Base Definitions volume of IEEE Std 1003.1-200x, but is repeated here for convenience:

For the purposes of IEEE Std 1003.1-200x, the following terminology definitions apply:

can

Describes a permissible optional feature or behavior available to the user or application. The feature or behavior is mandatory for an implementation that conforms to IEEE Std 1003.1-200x. An application can rely on the existence of the feature or behavior.

implementation-defined

Describes a value or behavior that is not defined by IEEE Std 1003.1-200x but is selected by an implementor. The value or behavior may vary among implementations that conform to IEEE Std 1003.1-200x. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations.

The implementor shall document such a value or behavior so that it can be used correctly by an application.

legacy

Describes a feature or behavior that is being retained for compatibility with older applications, but which has limitations which make it inappropriate for developing portable applications. New applications should use alternative means of obtaining equivalent functionality.

may

Describes a feature or behavior that is optional for an implementation that conforms to IEEE Std 1003.1-200x. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

To avoid ambiguity, the opposite of *may* is expressed as *need not*, instead of *may not*.

shall

For an implementation that conforms to IEEE Std 1003.1-200x, describes a feature or behavior that is mandatory. An application can rely on the existence of the feature or behavior.

For an application or user, describes a behavior that is mandatory.

should

For an implementation that conforms to IEEE Std 1003.1-200x, describes a feature or behavior that is recommended but not mandatory. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

For an application, describes a feature or behavior that is recommended programming practice for optimum portability.

undefined

Describes the nature of a value or behavior not defined by IEEE Std 1003.1-200x which results from use of an invalid program construct or invalid data input.

The value or behavior may vary among implementations that conform to IEEE Std 1003.1-200x. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

unspecified

Describes the nature of a value or behavior not specified by IEEE Std 1003.1-200x which results from use of a valid program construct or valid data input.

The value or behavior may vary among implementations that conform to IEEE Std 1003.1-200x. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

1.6 Definitions

Concepts and definitions are defined in the Base Definitions volume of IEEE Std 1003.1-200x.

1.7 Relationship to Other Formal Standards

Great care has been taken to ensure that this volume of IEEE Std 1003.1-200x is fully aligned with the following standards:

ISO C (1999)
ISO / IEC 9899: 1999, Programming Languages — C.

Parts of the ISO / IEC 9899: 1999 standard (hereinafter referred to as the ISO C standard) are referenced to describe requirements also mandated by this volume of IEEE Std 1003.1-200x. Some functions and headers included within this volume of IEEE Std 1003.1-200x have a version in the ISO C standard; in this case CX markings are added as appropriate to show where the ISO C standard has been extended (see Section 1.8.1). Any conflict between this volume of IEEE Std 1003.1-200x and the ISO C standard is unintentional.

This volume of IEEE Std 1003.1-200x also allows, but does not require, mathematics functions to support IEEE Std 754-1985 and IEEE Std 854-1987.

1.8 Portability

Some of the utilities in the Shell and Utilities volume of IEEE Std 1003.1-200x and functions in the System Interfaces volume of IEEE Std 1003.1-200x describe functionality that might not be fully portable to systems meeting the requirements for POSIX conformance (see the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 2, Conformance).

Where optional, enhanced, or reduced functionality is specified, the text is shaded and a code in the margin identifies the nature of the option, extension, or warning (see Section 1.8.1). For maximum portability, an application should avoid such functionality.

1.8.1 Codes

Margin codes and their meanings are listed in the Base Definitions volume of IEEE Std 1003.1-200x, but are repeated here for convenience:

ADV Advisory Information
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the ADV margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ADV margin legend.

AIO Asynchronous Input and Output
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the AIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the AIO margin legend.

BAR Barriers
The functionality described is optional. The functionality described is also an extension to the

ISO C standard.

Where applicable, functions are marked with the BAR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the BAR margin legend.

BE Batch Environment Services and Utilities

The functionality described is optional.

Where applicable, utilities are marked with the BE margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the BE margin legend.

CD C-Language Development Utilities

The functionality described is optional.

Where applicable, utilities are marked with the CD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the CD margin legend.

CPT Process CPU-Time Clocks

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the CPT margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the CPT margin legend.

CS Clock Selection

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the CS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the CS margin legend.

CX Extension to the ISO C standard

The functionality described is an extension to the ISO C standard. Application writers may make use of an extension as it is supported on all IEEE Std 1003.1-200x-conforming systems.

With each function or header from the ISO C standard, a statement to the effect that ‘‘any conflict is unintentional’’ is included. That is intended to refer to a direct conflict. IEEE Std 1003.1-200x acts in part as a profile of the ISO C standard, and it may choose to further constrain behaviors allowed to vary by the ISO C standard. Such limitations are not considered conflicts.

FD FORTRAN Development Utilities

The functionality described is optional.

Where applicable, utilities are marked with the FD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the FD margin legend.

FR FORTRAN Runtime Utilities

The functionality described is optional.

Where applicable, utilities are marked with the FR margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the FR margin legend.

FSC File Synchronization

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the FSC margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the FSC margin legend.

IP6 IPV6

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the IP6 margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the IP6 margin legend.

MC1 Advisory Information and either Memory Mapped Files or Shared Memory Objects

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

This is a shorthand notation for combinations of multiple option codes.

Where applicable, functions are marked with the MC1 margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MC1 margin legend.

Refer to the Base Definitions volume of IEEE Std 1003.1-200x, Section 1.5.2, Margin Code Notation.

MC2 Memory Mapped Files, Shared Memory Objects, or Memory Protection

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

This is a shorthand notation for combinations of multiple option codes.

Where applicable, functions are marked with the MC2 margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MC2 margin legend.

Refer to the Base Definitions volume of IEEE Std 1003.1-200x, Section 1.5.2, Margin Code Notation.

MF Memory Mapped Files

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MF margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MF margin legend.

ML Process Memory Locking

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the ML margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ML margin legend.

MLR Range Memory Locking

The functionality described is optional. The functionality described is also an extension to the

ISO C standard.

Where applicable, functions are marked with the MLR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MLR margin legend.

MON Monotonic Clock
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MON margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MON margin legend.

MPR Memory Protection
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MPR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MPR margin legend.

MSG Message Passing
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MSG margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MSG margin legend.

MX IEC 60559 Floating-Point Option
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MX margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MX margin legend.

OB Obsolescent
The functionality described may be withdrawn in a future version of this volume of IEEE Std 1003.1-200x. Strictly Conforming POSIX Applications and Strictly Conforming XSI Applications shall not use obsolescent features.

OF Output Format Incompletely Specified
The functionality described is an XSI extension. The format of the output produced by the utility is not fully specified. It is therefore not possible to post-process this output in a consistent fashion. Typical problems include unknown length of strings and unspecified field delimiters.

OH Optional Header
In the SYNOPSIS section of some interfaces in the System Interfaces volume of IEEE Std 1003.1-200x an included header is marked as in the following example:

OH
```
#include <sys/types.h>
#include <grp.h>
struct group *getgrnam(const char *name);
```

This indicates that the marked header is not required on XSI-conformant systems.

PIO

Prioritized Input and Output

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the PIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the PIO margin legend.

PS

Process Scheduling

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the PS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the PS margin legend.

RS

Raw Sockets

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the RS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the RS margin legend.

RTS

Realtime Signals Extension

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the RTS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the RTS margin legend.

SD

Software Development Utilities

The functionality described is optional.

Where applicable, utilities are marked with the SD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the SD margin legend.

SEM

Semaphores

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SEM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SEM margin legend.

SHM

Shared Memory Objects

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SHM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SHM margin legend.

SIO

Synchronized Input and Output

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SIO margin legend.

SPI Spin Locks

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SPI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SPI margin legend.

SPN Spawn

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SPN margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SPN margin legend.

SS Process Sporadic Server

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SS margin legend.

TCT Thread CPU-Time Clocks

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TCT margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TCT margin legend.

TEF Trace Event Filter

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TEF margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TEF margin legend.

THR Threads

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the THR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the THR margin legend.

TMO Timeouts

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TMO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TMO margin legend.

TMR Timers

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TMR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TMR margin legend.

TPI Thread Priority Inheritance

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPI margin legend.

TPP Thread Priority Protection

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPP margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPP margin legend.

TPS Thread Execution Scheduling

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPS margin legend.

TRC Trace

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRC margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRC margin legend.

TRI Trace Inherit

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRI margin legend.

TRL Trace Log

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRL margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRL margin legend.

TSA Thread Stack Address Attribute

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSA margin legend for the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSA margin legend.

TSF Thread-Safe Functions
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSF margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSF margin legend.

TSH Thread Process-Shared Synchronization
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSH margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSH margin legend.

TSP Thread Sporadic Server
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSP margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSP margin legend.

TSS Thread Stack Address Size
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSS margin legend.

TYM Typed Memory Objects
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TYM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TYM margin legend. |

UP User Portability Utilities
The functionality described is optional.

Where applicable, utilities are marked with the UP margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the UP margin legend.

XSI Extension
The functionality described is an XSI extension. Functionality marked XSI is also an extension to the ISO C standard. Application writers may confidently make use of an extension on all systems supporting the X/Open System Interfaces Extension.

If an entire SYNOPSIS section is shaded and marked XSI, all the functionality described in that reference page is an extension. See the Base Definitions volume of IEEE Std 1003.1-200x, Section 3.439, XSI.

XSR XSI STREAMS

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the XSR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the XSR margin legend.

1.9 Format of Entries

The entries in Chapter 3 are based on a common format as follows. The only sections relating to conformance are the SYNOPSIS, DESCRIPTION, RETURN VALUE, and ERRORS sections.

NAME

This section gives the name or names of the entry and briefly states its purpose.

SYNOPSIS

This section summarizes the use of the entry being described. If it is necessary to include a header to use this function, the names of such headers are shown, for example:

```
#include <stdio.h>
```

DESCRIPTION

This section describes the functionality of the function or header.

RETURN VALUE

This section indicates the possible return values, if any.

If the implementation can detect errors, ‘‘successful completion’’ means that no error has been detected during execution of the function. If the implementation does detect an error, the error is indicated.

For functions where no errors are defined, ‘‘successful completion’’ means that if the implementation checks for errors, no error has been detected. If the implementation can detect errors, and an error is detected, the indicated return value is returned and *errno* may be set.

ERRORS

This section gives the symbolic names of the error values returned by a function or stored into a variable accessed through the symbol *errno* if an error occurs.

‘‘No errors are defined’’ means that error values returned by a function or stored into a variable accessed through the symbol *errno*, if any, depend on the implementation.

EXAMPLES

This section is non-normative.

This section gives examples of usage, where appropriate. In the event of conflict between an example and a normative part of this volume of IEEE Std 1003.1-200x, the normative material is to be taken as correct.

APPLICATION USAGE

This section is non-normative.

This section gives warnings and advice to application writers about the entry. In the event of conflict between warnings and advice and a normative part of this volume of IEEE Std 1003.1-200x, the normative material is to be taken as correct.

RATIONALE

This section is non-normative.

This section contains historical information concerning the contents of this volume of IEEE Std 1003.1-200x and why features were included or discarded by the standard developers.

FUTURE DIRECTIONS

This section is non-normative.

This section provides comments which should be used as a guide to current thinking; there is not necessarily a commitment to adopt these future directions.

SEE ALSO

This section is non-normative.

This section gives references to related information.

CHANGE HISTORY

This section is non-normative.

This section shows the derivation of the entry and any significant changes that have been made to it.

Chapter 2

General Information

This chapter covers information that is relevant to all the functions specified in Chapter 3 and the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 13, Headers.

2.1 Use and Implementation of Functions

Each of the following statements shall apply unless explicitly stated otherwise in the detailed descriptions that follow:

1. If an argument to a function has an invalid value (such as a value outside the domain of the function, or a pointer outside the address space of the program, or a null pointer), the behavior is undefined.
2. Any function declared in a header may also be implemented as a macro defined in the header, so a function should not be declared explicitly if its header is included. Any macro definition of a function can be suppressed locally by enclosing the name of the function in parentheses, because the name is then not followed by the left parenthesis that indicates expansion of a macro function name. For the same syntactic reason, it is permitted to take the address of a function even if it is also defined as a macro. The use of the C-language **#undef** construct to remove any such macro definition shall also ensure that an actual function is referred to.
3. Any invocation of a function that is implemented as a macro shall expand to code that evaluates each of its arguments exactly once, fully protected by parentheses where necessary, so it is generally safe to use arbitrary expressions as arguments. Likewise, those function-like macros described in the following sections may be invoked in an expression anywhere a function with a compatible return type could be called.
4. Provided that a function can be declared without reference to any type defined in a header, it is also permissible to declare the function, either explicitly or implicitly, and use it without including its associated header.
5. If a function that accepts a variable number of arguments is not declared (explicitly or by including its associated header), the behavior is undefined.

2.2 The Compilation Environment

2.2.1 POSIX.1 Symbols

Certain symbols in this volume of IEEE Std 1003.1-200x are defined in headers (see the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 13, Headers). Some of those headers could also define symbols other than those defined by IEEE Std 1003.1-200x, potentially conflicting with symbols used by the application. Also, IEEE Std 1003.1-200x defines symbols that are not permitted by other standards to appear in those headers without some control on the visibility of those symbols.

Symbols called ‘‘feature test macros’’ are used to control the visibility of symbols that might be included in a header. Implementations, future versions of IEEE Std 1003.1-200x, and other standards may define additional feature test macros.

In the compilation of an application that **#define**s a feature test macro specified by IEEE Std 1003.1-200x, no header defined by IEEE Std 1003.1-200x shall be included prior to the definition of the feature test macro. This restriction also applies to any implementation-provided header in which these feature test macros are used. If the definition of the macro does not precede the **#include**, the result is undefined.

Feature test macros shall begin with the underscore character ('_').

2.2.1.1 The _POSIX_C_SOURCE Feature Test Macro

A POSIX-conforming application should ensure that the feature test macro _POSIX_C_SOURCE is defined before inclusion of any header.

When an application includes a header described by IEEE Std 1003.1-200x, and when this feature test macro is defined to have the value 200xxxL:

1. All symbols required by IEEE Std 1003.1-200x to appear when the header is included shall be made visible.
2. Symbols that are explicitly permitted, but not required, by IEEE Std 1003.1-200x to appear in that header (including those in reserved name spaces) may be made visible.
3. Additional symbols not required or explicitly permitted by IEEE Std 1003.1-200x to be in that header shall not be made visible, except when enabled by another feature test macro.

Identifiers in IEEE Std 1003.1-200x may only be undefined using the **#undef** directive as described in Section 2.1 (on page 463) or Section 2.2.2. These **#undef** directives shall follow all **#include** directives of any header in IEEE Std 1003.1-200x.

Note: The POSIX.1-1990 standard specified a macro called _POSIX_SOURCE. This has been superseded by _POSIX_C_SOURCE.

2.2.1.2 The _XOPEN_SOURCE Feature Test Macro

XSI An XSI-conforming application should ensure that the feature test macro _XOPEN_SOURCE is defined with the value 600 before inclusion of any header. This is needed to enable the functionality described in Section 2.2.1.1 and in addition to enable the X/Open System Interfaces Extension.

Since this volume of IEEE Std 1003.1-200x is aligned with the ISO C standard, and since all functionality enabled by _POSIX_C_SOURCE set equal to 200xxxL is enabled by _XOPEN_SOURCE set equal to 600, there should be no need to define _POSIX_C_SOURCE if _XOPEN_SOURCE is so defined. Therefore, if _XOPEN_SOURCE is set equal to 600 and _POSIX_C_SOURCE is set equal to 200xxxL, the behavior is the same as if only _XOPEN_SOURCE is defined and set equal to 600. However, should _POSIX_C_SOURCE be set to a value greater than 200xxxL, the behavior is unspecified.

2.2.2 The Name Space

All identifiers in this volume of IEEE Std 1003.1-200x, except *environ*, are defined in at least one of the headers, as shown in the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 13, XSI Headers. When _XOPEN_SOURCE or _POSIX_C_SOURCE is defined, each header defines or declares some identifiers, potentially conflicting with identifiers used by the application. The set of identifiers visible to the application consists of precisely those identifiers from the header pages of the included headers, as well as additional identifiers reserved for the implementation. In addition, some headers may make visible identifiers from other headers as indicated on the relevant header pages.

Implementations may also add members to a structure or union without controlling the visibility of those members with a feature test macro, as long as a user-defined macro with the same name cannot interfere with the correct interpretation of the program. The identifiers reserved for use by the implementation are described below:

1. Each identifier with external linkage described in the header section is reserved for use as an identifier with external linkage if the header is included.
2. Each macro described in the header section is reserved for any use if the header is included.
3. Each identifier with file scope described in the header section is reserved for use as an identifier with file scope in the same name space if the header is included.

The prefixes posix_, POSIX_, and _POSIX_ are reserved for use by IEEE Std 1003.1-200x and other POSIX standards. Implementations may add symbols to the headers shown in the following table, provided the identifiers for those symbols begin with the corresponding reserved prefixes in the following table, and do not use the reserved prefixes posix_, POSIX_, or _POSIX_.

	Header	Prefix	Suffix	Complete Name
AIO	**<aio.h>**	aio_, lio_, AIO_, LIO_		
	<arpa/inet.h>	in_, inet_		
	<ctype.h>	to[a-z], is[a-z]		
	<dirent.h>	d_		
	<errno.h>	E[0-9], E[A-Z]		
	<fcntl.h>	l_		
	<glob.h>	gl_		
	<grp.h>	gr_		
	<inttypes.h>			int[0-9a-z_]*_t, uint[0-9a-z_]*_t
	<limits.h>		_MAX, _MIN	
	<locale.h>	LC_[A-Z]		
MSG	**<mqueue.h>**	mq_, MQ_		
XSI	**<ndbm.h>**	dbm_		
	<netdb.h>	h_, n_, p_, s_		
	<net/if.h>	if_		
	<netinet/in.h>	in_, ip_, s_, sin_		
IP6		in6_, s6_, sin6_		
XSI	**<poll.h>**	pd_, ph_, ps_		
	<pthread.h>	pthread_, PTHREAD_		
	<pwd.h>	pw_

	<time.h>	tm_		
TMR		clock_, timer_, it_, tv_, CLOCK_, TIMER_		
XSI	**<ucontext.h>**	uc_, ss_		
XSI	**<ulimit.h>**	UL_		
	<utime.h>	utim_		
XSI	**<utmpx.h>**	ut_	_LVL, _TIME, _PROCESS	
	<wchar.h>	wcs[a-z]		
	<wctype.h>	is[a-z], to[a-z]		
	<wordexp.h>	we_		
	ANY header	POSIX_, _POSIX_, posix_	_t	

Note: The notation [A–Z] indicates any uppercase letter in the portable character set. The notation [a–z] indicates any lowercase letter in the portable character set. Commas and spaces in the lists of prefixes and complete names in the above table are not part of any prefix or complete name.

If any header in the following table is included, macros with the prefixes shown may be defined. After the last inclusion of a given header, an application may use identifiers with the corresponding prefixes for its own purpose, provided their use is preceded by a **#undef** of the corresponding macro.

	Header	Prefix
XSI	**<dlfcn.h>**	RTLD_
	<fcntl.h>	F_, O_, S_
XSI	**<fmtmsg.h>**	MM_
	<fnmatch.h>	FNM_
XSI	**<ftw.h>**	FTW
	<glob.h>	GLOB_
	<inttypes.h>	PRI[a-z], SCN[a-z]
XSI	**<ndbm.h>**	DBM_
	<net/if.h>	IF_
	<netinet/in.h>	IMPLINK_, IN_, INADDR_, IP_, IPPORT_, IPPROTO_, SOCK_
IP6		IPV6_, IN6_
	<netinet/tcp.h>	TCP_
XSI	**<nl_types.h>**	NL_
XSI	**<poll.h>**	POLL
	<regex.h>	REG_
	<signal.h>	SA_, SIG_[0-9a-z_],
XSI		BUS_, CLD_, FPE_, ILL_, POLL_, SEGV_, SI_, SS_, SV_, TRAP_
	stdint.h	INT[0-9A-Z_]_MIN, INT[0-9A-Z_]_MAX, INT[0-9A-Z_]_C UINT[0-9A-Z_]_MIN, UINT[0-9A-Z_]_MAX, UINT[0-9A-Z_]_C
XSI	**<stropts.h>**	FLUSH[A-Z], I_, M_, MUXID_R[A-Z], S_, SND[A-Z], STR
XSI	**<syslog.h>**	LOG_
XSI	**<sys/ipc.h>**	IPC_
XSI	**<sys/mman.h>**	PROT_, MAP_, MS_
XSI	**<sys/msg.h>**	MSG[A-Z]
XSI	**<sys/resource.h>**	PRIO_, RLIM_, RLIMIT_, RUSAGE_
XSI	**<sys/sem.h>**	SEM_
XSI	**<sys/shm.h>**	SHM[A-Z], SHM_[A-Z]
XSI	**<sys/socket.h>**	AF_, CMSG_, MSG_, PF_, SCM_, SHUT_, SO
	<sys/stat.h>	S_
XSI	**<sys/statvfs.h>**	ST_
XSI	**<sys/time.h>**	FD_, ITIMER_
XSI	**<sys/uio.h>**	IOV_
XSI	**<sys/wait.h>**	BUS_, CLD_, FPE_, ILL_, POLL_, SEGV_, SI_, TRAP_
	<termios.h>	V, I, O, TC, B[0-9] (See below.)
	<wordexp.h>	WRDE_

Note: The notation [0–9] indicates any digit. The notation [A–Z] indicates any uppercase letter in the portable character set. The notation [0–9a–z_] indicates any digit, any lowercase letter in the portable character set, or underscore.

The following reserved names are used as exact matches for **<termios.h>**:

XSI
CBAUD
DEFECHO
ECHOCTL
ECHOKE
ECHOPRT
EXTA
EXTB
FLUSHO
LOBLK
PENDIN
SWTCH
VDISCARD
VDSUSP
VLNEXT
VREPRINT
VSTATUS
VWERASE

The following identifiers are reserved regardless of the inclusion of headers:

1. All identifiers that begin with an underscore and either an uppercase letter or another underscore are always reserved for any use by the implementation.
2. All identifiers that begin with an underscore are always reserved for use as identifiers with file scope in both the ordinary identifier and tag name spaces.
3. All identifiers in the table below are reserved for use as identifiers with external linkage. Some of these identifiers do not appear in this volume of IEEE Std 1003.1-200x, but are reserved for future use by the ISO C standard.

4. All functions and external identifiers defined in the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 13, Headers are reserved for use as identifiers with external linkage.

5. All the identifiers defined in this volume of IEEE Std 1003.1-200x that have external linkage are always reserved for use as identifiers with external linkage.

No other identifiers are reserved.

Applications shall not declare or define identifiers with the same name as an identifier reserved in the same context. Since macro names are replaced whenever found, independent of scope and name space, macro names matching any of the reserved identifier names shall not be defined by an application if any associated header is included.

Except that the effect of each inclusion of **<assert.h>** depends on the definition of NDEBUG, headers may be included in any order, and each may be included more than once in a given scope, with no difference in effect from that of being included only once.

If used, the application shall ensure that a header is included outside of any external declaration or definition, and it shall be first included before the first reference to any type or macro it defines, or to any function or object it declares. However, if an identifier is declared or defined in more than one header, the second and subsequent associated headers may be included after the initial reference to the identifier. Prior to the inclusion of a header, the application shall not define any macros with names lexically identical to symbols defined by that header.

2.3 Error Numbers

Most functions can provide an error number. The means by which each function provides its error numbers is specified in its description.

Some functions provide the error number in a variable accessed through the symbol *errno*. The symbol *errno*, defined by including the **<errno.h>** header, expands to a modifiable lvalue of type **int**. It is unspecified whether *errno* is a macro or an identifier declared with external linkage. If a macro definition is suppressed in order to access an actual object, or a program defines an identifier with the name *errno*, the behavior is undefined.

The value of *errno* should only be examined when it is indicated to be valid by a function's return value. No function in this volume of IEEE Std 1003.1-200x shall set *errno* to zero. For each thread of a process, the value of *errno* shall not be affected by function calls or assignments to *errno* by other threads.

Some functions return an error number directly as the function value. These functions return a value of zero to indicate success.

If more than one error occurs in processing a function call, any one of the possible errors may be returned, as the order of detection is undefined.

Implementations may support additional errors not included in this list, may generate errors included in this list under circumstances other than those described here, or may contain extensions or limitations that prevent some errors from occurring. The ERRORS section on each reference page specifies whether an error shall be returned, or whether it may be returned. Implementations shall not generate a different error number from the ones described here for error conditions described in this volume of IEEE Std 1003.1-200x, but may generate additional errors unless explicitly disallowed for a particular function.

Each implementation shall document, in the conformance document, situations in which each of the optional conditions defined in IEEE Std 1003.1-200x is detected. The conformance document may also contain statements that one or more of the optional error conditions are not detected.

For functions under the Threads option for which [EINTR] is not listed as a possible error condition in this volume of IEEE Std 1003.1-200x, an implementation shall not return an error code of [EINTR].

The following symbolic names identify the possible error numbers, in the context of the functions specifically defined in this volume of IEEE Std 1003.1-200x; these general descriptions are more precisely defined in the ERRORS sections of the functions that return them. Only these symbolic names should be used in programs, since the actual value of the error number is unspecified. All values listed in this section shall be unique integer constant expressions with type **int** suitable for use in **#if** preprocessing directives, except as noted below. The values for all these names shall be found in the **<errno.h>** header defined in the Base Definitions volume of IEEE Std 1003.1-200x. The actual values are unspecified by this volume of IEEE Std 1003.1-200x.

[E2BIG]

Argument list too long. The sum of the number of bytes used by the new process image's argument list and environment list is greater than the system-imposed limit of {ARG_MAX} bytes.

or:

Lack of space in an output buffer.

or:

Argument is greater than the system-imposed maximum.

[EACCES]

Permission denied. An attempt was made to access a file in a way forbidden by its file access permissions.

[EADDRINUSE]

Address in use. The specified address is in use.

[EADDRNOTAVAIL]

Address not available. The specified address is not available from the local system.

[EAFNOSUPPORT]

Address family not supported. The implementation does not support the specified address family, or the specified address is not a valid address for the address family of the specified socket.

[EAGAIN]

Resource temporarily unavailable. This is a temporary condition and later calls to the same routine may complete normally.

[EALREADY]

Connection already in progress. A connection request is already in progress for the specified socket.

[EBADF]

Bad file descriptor. A file descriptor argument is out of range, refers to no open file, or a read (write) request is made to a file that is only open for writing (reading).

[EBADMSG]

XSR Bad message. During a *read*(), *getmsg*(), *getpmsg*(), or *ioctl*() I_RECVFD request to a STREAMS device, a message arrived at the head of the STREAM that is inappropriate for the function receiving the message.

read()	Message waiting to be read on a STREAM is not a data message.
getmsg() or *getpmsg*()	A file descriptor was received instead of a control message.
ioctl()	Control or data information was received instead of a file descriptor when I_RECVFD was specified.

or:

Bad Message. The implementation has detected a corrupted message.

[EBUSY]
Resource busy. An attempt was made to make use of a system resource that is not currently available, as it is being used by another process in a manner that would have conflicted with the request being made by this process.

[ECANCELED]
Operation canceled. The associated asynchronous operation was canceled before completion.

[ECHILD]
No child process. A *wait*( ) or *waitpid*( ) function was executed by a process that had no existing or unwaited-for child process.

[ECONNABORTED]
Connection aborted. The connection has been aborted.

[ECONNREFUSED]
Connection refused. An attempt to connect to a socket was refused because there was no process listening or because the queue of connection requests was full and the underlying protocol does not support retransmissions.

[ECONNRESET]
Connection reset. The connection was forcibly closed by the peer.

[EDEADLK]
Resource deadlock would occur. An attempt was made to lock a system resource that would have resulted in a deadlock situation.

[EDESTADDRREQ]
Destination address required. No bind address was established.

[EDOM]
Domain error. An input argument is outside the defined domain of the mathematical function (defined in the ISO C standard).

[EDQUOT]
Reserved.

[EEXIST]
File exists. An existing file was mentioned in an inappropriate context; for example, as a new link name in the *link*( ) function.

[EFAULT]
Bad address. The system detected an invalid address in attempting to use an argument of a call. The reliable detection of this error cannot be guaranteed, and when not detected may result in the generation of a signal, indicating an address violation, which is sent to the process.

[EFBIG]
File too large. The size of a file would exceed the maximum file size of an implementation or offset maximum established in the corresponding file description.

[EHOSTUNREACH]
Host is unreachable. The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).

[EIDRM]
Identifier removed. Returned during XSI interprocess communication if an identifier has been removed from the system.

[EILSEQ]
Illegal byte sequence. A wide-character code has been detected that does not correspond to a valid character, or a byte sequence does not form a valid wide-character code (defined in the ISO C standard).

[EINPROGRESS]
Operation in progress. This code is used to indicate that an asynchronous operation has not yet completed.

or:

O_NONBLOCK is set for the socket file descriptor and the connection cannot be immediately established.

[EINTR]
Interrupted function call. An asynchronous signal was caught by the process during the execution of an interruptible function. If the signal handler performs a normal return, the interrupted function call may return this condition (see the Base Definitions volume of IEEE Std 1003.1-200x, **<signal.h>**).

[EINVAL]
Invalid argument. Some invalid argument was supplied; for example, specifying an undefined signal in a *signal*( ) function or a *kill*( ) function.

[EIO]
Input/output error. Some physical input or output error has occurred. This error may be reported on a subsequent operation on the same file descriptor. Any other error-causing operation on the same file descriptor may cause the [EIO] error indication to be lost.

[EISCONN]
Socket is connected. The specified socket is already connected.

[EISDIR]
Is a directory. An attempt was made to open a directory with write mode specified.

[ELOOP]
Symbolic link loop. A loop exists in symbolic links encountered during pathname resolution. This error may also be returned if more than {SYMLOOP_MAX} symbolic links are encountered during pathname resolution.

[EMFILE]
Too many open files. An attempt was made to open more than the maximum number of {OPEN_MAX} file descriptors allowed in this process.

[EMLINK]
Too many links. An attempt was made to have the link count of a single file exceed {LINK_MAX}.

[EMSGSIZE]
Message too large. A message sent on a transport provider was larger than an internal message buffer or some other network limit.

or:

Inappropriate message buffer length.

[EMULTIHOP]
Reserved.

[ENAMETOOLONG]
Filename too long. The length of a pathname exceeds {PATH_MAX}, or a pathname component is longer than {NAME_MAX}. This error may also occur when pathname substitution, as a result of encountering a symbolic link during pathname resolution, results in a pathname string the size of which exceeds {PATH_MAX}.

[ENETDOWN]
Network is down. The local network interface used to reach the destination is down.

[ENETRESET]
The connection was aborted by the network.

[ENETUNREACH]
Network unreachable. No route to the network is present.

[ENFILE]
Too many files open in system. Too many files are currently open in the system. The system has reached its predefined limit for simultaneously open files and temporarily cannot accept requests to open another one.

[ENOBUFS]
No buffer space available. Insufficient buffer resources were available in the system to perform the socket operation.

XSR [ENODATA]
No message available. No message is available on the STREAM head read queue.

[ENODEV]
No such device. An attempt was made to apply an inappropriate function to a device; for example, trying to read a write-only device such as a printer.

[ENOENT]
No such file or directory. A component of a specified pathname does not exist, or the pathname is an empty string.

[ENOEXEC]
Executable file format error. A request is made to execute a file that, although it has the appropriate permissions, is not in the format required by the implementation for executable files.

[ENOLCK]
No locks available. A system-imposed limit on the number of simultaneous file and record locks has been reached and no more are currently available.

[ENOLINK]
Reserved.

[ENOMEM]
Not enough space. The new process image requires more memory than is allowed by the hardware or system-imposed memory management constraints.

[ENOMSG]
No message of the desired type. The message queue does not contain a message of the required type during XSI interprocess communication.

[ENOPROTOOPT]
Protocol not available. The protocol option specified to *setsockopt*( ) is not supported by the implementation.

[ENOSPC]
No space left on a device. During the *write*( ) function on a regular file or when extending a directory, there is no free space left on the device.

XSR [ENOSR]
No STREAM resources. Insufficient STREAMS memory resources are available to perform a STREAMS-related function. This is a temporary condition; it may be recovered from if other processes release resources.

XSR [ENOSTR]
Not a STREAM. A STREAM function was attempted on a file descriptor that was not associated with a STREAMS device.

[ENOSYS]
Function not implemented. An attempt was made to use a function that is not available in this implementation.

[ENOTCONN]
Socket not connected. The socket is not connected.

[ENOTDIR]
Not a directory. A component of the specified pathname exists, but it is not a directory, when a directory was expected. |

[ENOTEMPTY]
Directory not empty. A directory other than an empty directory was supplied when an empty directory was expected.

[ENOTSOCK]
Not a socket. The file descriptor does not refer to a socket.

[ENOTSUP]
Not supported. The implementation does not support this feature of the Realtime Option Group.

[ENOTTY]
Inappropriate I/O control operation. A control function has been attempted for a file or special file for which the operation is inappropriate.

[ENXIO]
No such device or address. Input or output on a special file refers to a device that does not exist, or makes a request beyond the capabilities of the device. It may also occur when, for example, a tape drive is not on-line.

[EOPNOTSUPP]
Operation not supported on socket. The type of socket (address family or protocol) does not support the requested operation.

[EOVERFLOW]
Value too large to be stored in data type. An operation was attempted which would generate a value that is outside the range of values that can be represented in the relevant data type or that are allowed for a given data item. |

[EPERM]
Operation not permitted. An attempt was made to perform an operation limited to processes with appropriate privileges or to the owner of a file or other resource.

[EPIPE]
Broken pipe. A write was attempted on a socket, pipe, or FIFO for which there is no process

to read the data.

[EPROTO]
Protocol error. Some protocol error occurred. This error is device-specific, but is generally not related to a hardware failure.

[EPROTONOSUPPORT]
Protocol not supported. The protocol is not supported by the address family, or the protocol is not supported by the implementation.

[EPROTOTYPE]
Protocol wrong type for socket. The socket type is not supported by the protocol.

[ERANGE]
Result too large or too small. The result of the function is too large (overflow) or too small (underflow) to be represented in the available space (defined in the ISO C standard).

[EROFS]
Read-only file system. An attempt was made to modify a file or directory on a file system that is read-only.

[ESPIPE]
Invalid seek. An attempt was made to access the file offset associated with a pipe or FIFO.

[ESRCH]
No such process. No process can be found corresponding to that specified by the given process ID.

[ESTALE]
Reserved.

XSR [ETIME]
STREAM *ioctl*( ) timeout. The timer set for a STREAMS *ioctl*( ) call has expired. The cause of this error is device-specific and could indicate either a hardware or software failure, or a timeout value that is too short for the specific operation. The status of the *ioctl*( ) operation is unspecified. |

[ETIMEDOUT]
Connection timed out. The connection to a remote machine has timed out. If the connection timed out during execution of the function that reported this error (as opposed to timing out prior to the function being called), it is unspecified whether the function has completed some or all of the documented behavior associated with a successful completion of the function.

or:

Operation timed out. The time limit associated with the operation was exceeded before the operation completed.

[ETXTBSY]
Text file busy. An attempt was made to execute a pure-procedure program that is currently open for writing, or an attempt has been made to open for writing a pure-procedure program that is being executed.

[EWOULDBLOCK]
Operation would block. An operation on a socket marked as non-blocking has encountered a situation such as no data available that otherwise would have caused the function to suspend execution.

A conforming implementation may assign the same values for [EWOULDBLOCK] and [EAGAIN].

[EXDEV]
Improper link. A link to a file on another file system was attempted.

2.3.1 Additional Error Numbers

Additional implementation-defined error numbers may be defined in **<errno.h>**.

2.4 Signal Concepts

2.4.1 Signal Generation and Delivery

A signal is said to be *generated* for (or sent to) a process or thread when the event that causes the signal first occurs. Examples of such events include detection of hardware faults, timer expiration, RTS signals generated via the **sigevent** structure and terminal activity, as well as invocations of the *kill*() RTS and *sigqueue*() functions. In some circumstances, the same event generates signals for multiple processes.

At the time of generation, a determination shall be made whether the signal has been generated for the process or for a specific thread within the process. Signals which are generated by some action attributable to a particular thread, such as a hardware fault, shall be generated for the thread that caused the signal to be generated. Signals that are generated in association with a process ID or process group ID or an asynchronous event, such as terminal activity, shall be generated for the process.

Each process has an action to be taken in response to each signal defined by the system (see Section 2.4.3 (on page 480)). A signal is said to be *delivered* to a process when the appropriate action for the process and signal is taken. A signal is said to be *accepted* by a process when the signal is selected and returned by one of the *sigwait*() functions.

During the time between the generation of a signal and its delivery or acceptance, the signal is said to be *pending*. Ordinarily, this interval cannot be detected by an application. However, a signal can be *blocked* from delivery to a thread. If the action associated with a blocked signal is anything other than to ignore the signal, and if that signal is generated for the thread, the signal shall remain pending until it is unblocked, it is accepted when it is selected and returned by a call to the *sigwait*() function, or the action associated with it is set to ignore the signal. Signals generated for the process shall be delivered to exactly one of those threads within the process which is in a call to a *sigwait*() function selecting that signal or has not blocked delivery of the signal. If there are no threads in a call to a *sigwait*() function selecting that signal, and if all threads within the process block delivery of the signal, the signal shall remain pending on the process until a thread calls a *sigwait*() function selecting that signal, a thread unblocks delivery of the signal, or the action associated with the signal is set to ignore the signal. If the action associated with a blocked signal is to ignore the signal and if that signal is generated for the process, it is unspecified whether the signal is discarded immediately upon generation or remains pending.

Each thread has a *signal mask* that defines the set of signals currently blocked from delivery to it. | The signal mask for a thread shall be initialized from that of its parent or creating thread, or from | the corresponding thread in the parent process if the thread was created as the result of a call to | *fork*(). The *sigaction*(), *sigprocmask*(), and *sigsuspend*() functions control the manipulation of the signal mask.

The determination of which action is taken in response to a signal is made at the time the signal is delivered, allowing for any changes since the time of generation. This determination is independent of the means by which the signal was originally generated. If a subsequent occurrence of a pending signal is generated, it is implementation-defined as to whether the RTS signal is delivered or accepted more than once in circumstances other than those in which queuing is required under the Realtime Signals Extension option. The order in which multiple, simultaneously pending signals outside the range SIGRTMIN to SIGRTMAX are delivered to or accepted by a process is unspecified.

When any stop signal (SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU) is generated for a process, any pending SIGCONT signals for that process shall be discarded. Conversely, when SIGCONT is generated for a process, all pending stop signals for that process shall be discarded. When SIGCONT is generated for a process that is stopped, the process shall be continued, even if the SIGCONT signal is blocked or ignored. If SIGCONT is blocked and not ignored, it shall remain pending until it is either unblocked or a stop signal is generated for the process.

An implementation shall document any condition not specified by this volume of IEEE Std 1003.1-200x under which the implementation generates signals.

2.4.2 Realtime Signal Generation and Delivery

RTS This section describes extensions to support realtime signal generation and delivery. This functionality is dependent on support of the Realtime Signals Extension option (and the rest of this section is not further shaded for this option).

Some signal-generating functions, such as high-resolution timer expiration, asynchronous I/O completion, interprocess message arrival, and the *sigqueue*( ) function, support the specification of an application-defined value, either explicitly as a parameter to the function or in a **sigevent** structure parameter. The **sigevent** structure is defined in **<signal.h>** and contains at least the following members:

Member Type	Member Name	Description
int	*sigev_notify*	Notification type.
int	*sigev_signo*	Signal number.
union sigval	*sigev_value*	Signal value.
void(*)(unsigned sigval)	*sigev_notify_function*	Notification function.
(pthread_attr_t*)	*sigev_notify_attributes*	Notification attributes.

The *sigev_notify* member specifies the notification mechanism to use when an asynchronous event occurs. This volume of IEEE Std 1003.1-200x defines the following values for the *sigev_notify* member:

SIGEV_NONE	No asynchronous notification shall be delivered when the event of interest occurs.
SIGEV_SIGNAL	The signal specified in *sigev_signo* shall be generated for the process when the event of interest occurs. If the implementation supports the Realtime Signals Extension option and if the SA_SIGINFO flag is set for that signal number, then the signal shall be queued to the process and the value specified in *sigev_value* shall be the *si_value* component of the generated signal. If SA_SIGINFO is not set for that signal number, it is unspecified whether the signal is queued and what value, if any, is sent.
SIGEV_THREAD	A notification function shall be called to perform notification.

An implementation may define additional notification mechanisms.

The *sigev_signo* member specifies the signal to be generated. The *sigev_value* member is the application-defined value to be passed to the signal-catching function at the time of the signal delivery or to be returned at signal acceptance as the *si_value* member of the **siginfo_t** structure.

The **sigval** union is defined in **<signal.h>** and contains at least the following members: |

Member Type	Member Name	Description
int	*sival_int*	Integer signal value.
void*	*sival_ptr*	Pointer signal value.

The *sival_int* member shall be used when the application-defined value is of type **int**; the *sival_ptr* member shall be used when the application-defined value is a pointer.

When a signal is generated by the *sigqueue*( ) function or any signal-generating function that supports the specification of an application-defined value, the signal shall be marked pending and, if the SA_SIGINFO flag is set for that signal, the signal shall be queued to the process along with the application-specified signal value. Multiple occurrences of signals so generated are queued in FIFO order. It is unspecified whether signals so generated are queued when the SA_SIGINFO flag is not set for that signal.

Signals generated by the *kill*( ) function or other events that cause signals to occur, such as detection of hardware faults, *alarm*( ) timer expiration, or terminal activity, and for which the implementation does not support queuing, shall have no effect on signals already queued for the same signal number.

When multiple unblocked signals, all in the range SIGRTMIN to SIGRTMAX, are pending, the behavior shall be as if the implementation delivers the pending unblocked signal with the lowest signal number within that range. No other ordering of signal delivery is specified.

If, when a pending signal is delivered, there are additional signals queued to that signal number, the signal shall remain pending. Otherwise, the pending indication shall be reset.

Multi-threaded programs can use an alternate event notification mechanism. When a notification is processed, and the *sigev_notify* member of the **sigevent** structure has the value SIGEV_THREAD, the function *sigev_notify_function* is called with parameter *sigev_value*.

The function shall be executed in an environment as if it were the *start_routine* for a newly created thread with thread attributes specified by *sigev_notify_attributes*. If *sigev_notify_attributes* is NULL, the behavior shall be as if the thread were created with the *detachstate* attribute set to PTHREAD_CREATE_DETACHED. Supplying an attributes structure with a *detachstate* attribute of PTHREAD_CREATE_JOINABLE results in undefined behavior. The signal mask of this thread is implementation-defined.

2.4.3 Signal Actions

There are three types of action that can be associated with a signal: SIG_DFL, SIG_IGN, or a pointer to a function. Initially, all signals shall be set to SIG_DFL or SIG_IGN prior to entry of the *main*( ) routine (see the *exec* functions). The actions prescribed by these values are as follows:

SIG_DFL Signal-specific default action.

The default actions for the signals defined in this volume of IEEE Std 1003.1-200x are specified under **<signal.h>**. RTS If the Realtime Signals Extension option is supported, the default actions for the realtime signals in the range SIGRTMIN to SIGRTMAX shall be to terminate the process abnormally.

If the default action is to stop the process, the execution of that process is temporarily suspended. When a process stops, a SIGCHLD signal shall be generated for its parent process, unless the parent process has set the SA_NOCLDSTOP flag. While a process is stopped, any additional signals that are sent to the process shall not be delivered until the process is continued, except SIGKILL which always terminates the receiving process. A process that is a member of an orphaned process group shall not be allowed to stop in response to the SIGTSTP, SIGTTIN, or SIGTTOU signals. In cases where delivery of one of these signals would stop such a process, the signal shall be discarded.

Setting a signal action to SIG_DFL for a signal that is pending, and whose default action is to ignore the signal (for example, SIGCHLD), shall cause the pending signal to be discarded, whether or not it is blocked.

RTS The default action for SIGCONT is to resume execution at the point where the process was stopped, after first handling any pending unblocked signals. If the Realtime Signals Extension option is supported, any queued values pending shall be discarded and the resources used to queue them shall be released and returned to the system for other use. When a stopped process is continued, a SIGCHLD signal may be generated for its parent process, unless the parent process has set the SA_NOCLDSTOP flag.

SIG_IGN Ignore signal.

RTS Delivery of the signal shall have no effect on the process. The behavior of a process is undefined after it ignores a SIGFPE, SIGILL, SIGSEGV, or SIGBUS signal that was not generated by *kill*( ), *sigqueue*( ), or *raise*( ).

The system shall not allow the action for the signals SIGKILL or SIGSTOP to be set to SIG_IGN.

Setting a signal action to SIG_IGN for a signal that is pending shall cause the pending signal to be discarded, whether or not it is blocked.

XSI If a process sets the action for the SIGCHLD signal to SIG_IGN, the behavior is unspecified, except as specified below.

If the action for the SIGCHLD signal is set to SIG_IGN, child processes of the calling processes shall not be transformed into zombie processes when they terminate. If the calling process subsequently waits for its children, and the process has no unwaited-for children that were transformed into zombie processes, it shall block until all of its children terminate, and *wait*( ), *waitid*( ), and *waitpid*( ) shall fail and set *errno* to [ECHILD].

RTS If the Realtime Signals Extension option is supported, any queued values pending shall be discarded and the resources used to queue them shall be released and made available to queue other signals.

pointer to a function
Catch signal.

On delivery of the signal, the receiving process is to execute the signal-catching function at the specified address. After returning from the signal-catching function, the receiving process shall resume execution at the point at which it was interrupted.

If the SA_SIGINFO flag for the signal is cleared, the signal-catching function shall be entered as a C-language function call as follows:

```
void func(int signo);
```

XSI | RTS If the SA_SIGINFO flag for the signal is set, the signal-catching function shall be entered as a C-language function call as follows:

```
void func(int signo, siginfo_t *info, void *context);
```

where *func* is the specified signal-catching function, *signo* is the signal number of the signal being delivered, and *info* is a pointer to a **siginfo_t** structure defined in **<signal.h>** containing at least the following members:

Member Type	**Member Name**	**Description**
int	*si_signo*	Signal number.
int	*si_code*	Cause of the signal.
union sigval	*si_value*	Signal value.

The *si_signo* member shall contain the signal number. This shall be the same as the *signo* parameter. The *si_code* member shall contain a code identifying the cause of the signal. The following values are defined for *si_code*:

	SI_USER	The signal was sent by the *kill*( ) function. The implementation may set *si_code* to SI_USER if the signal was sent by the *raise*( ) or *abort*( ) functions or any similar functions provided as implementation extensions.
RTS	SI_QUEUE	The signal was sent by the *sigqueue*( ) function.
RTS	SI_TIMER	The signal was generated by the expiration of a timer set by *timer_settime*( ).
RTS	SI_ASYNCIO	The signal was generated by the completion of an asynchronous I/O request.
RTS	SI_MESGQ	The signal was generated by the arrival of a message on an empty message queue.

If the signal was not generated by one of the functions or events listed above, the *si_code* shall be set to an implementation-defined value that is not equal to any of the values defined above.

RTS If the Realtime Signals Extension is supported, and *si_code* is one of SI_QUEUE, SI_TIMER, SI_ASYNCIO, or SI_MESGQ, then *si_value* shall contain the application-specified signal value. Otherwise, the contents of *si_value* are undefined.

The behavior of a process is undefined after it returns normally from a signal-
XSI catching function for a SIGBUS, SIGFPE, SIGILL, or SIGSEGV signal that was not
RTS generated by *kill*( ), *sigqueue*( ), or *raise*( ).

The system shall not allow a process to catch the signals SIGKILL and SIGSTOP.

If a process establishes a signal-catching function for the SIGCHLD signal while it has a terminated child process for which it has not waited, it is unspecified whether a SIGCHLD signal is generated to indicate that child process.

When signal-catching functions are invoked asynchronously with process execution, the behavior of some of the functions defined by this volume of IEEE Std 1003.1-200x is unspecified if they are called from a signal-catching function.

The following table defines a set of functions that shall be either reentrant or non-interruptible by signals and shall be async-signal-safe. Therefore applications may invoke them, without restriction, from signal-catching functions:

All functions not in the above table are considered to be unsafe with respect to signals. In the presence of signals, all functions defined by this volume of IEEE Std 1003.1-200x shall behave as defined when called from or interrupted by a signal-catching function, with a single exception: when a signal interrupts an unsafe function and the signal-catching function calls an unsafe function, the behavior is undefined.

When a signal is delivered to a thread, if the action of that signal specifies termination, stop, or continue, the entire process shall be terminated, stopped, or continued, respectively.

2.4.4 Signal Effects on Other Functions

Signals affect the behavior of certain functions defined by this volume of IEEE Std 1003.1-200x if delivered to a process while it is executing such a function. If the action of the signal is to terminate the process, the process shall be terminated and the function shall not return. If the action of the signal is to stop the process, the process shall stop until continued or terminated. Generation of a SIGCONT signal for the process shall cause the process to be continued, and the original function shall continue at the point the process was stopped. If the action of the signal is to invoke a signal-catching function, the signal-catching function shall be invoked; in this case the original function is said to be *interrupted* by the signal. If the signal-catching function executes a **return** statement, the behavior of the interrupted function shall be as described individually for that function, except as noted for unsafe functions. Signals that are ignored shall not affect the behavior of any function; signals that are blocked shall not affect the behavior of any function until they are unblocked and then delivered, except as specified for the *sigpending*( ) and *sigwait*( ) functions.

2.5 Standard I/O Streams

A stream is associated with an external file (which may be a physical device) by *opening* a file, which may involve *creating* a new file. Creating an existing file causes its former contents to be discarded if necessary. If a file can support positioning requests, (such as a disk file, as opposed to a terminal), then a *file position indicator* associated with the stream is positioned at the start (byte number 0) of the file, unless the file is opened with append mode, in which case it is implementation-defined whether the file position indicator is initially positioned at the beginning or end of the file. The file position indicator is maintained by subsequent reads, writes, and positioning requests, to facilitate an orderly progression through the file. All input takes place as if bytes were read by successive calls to *fgetc*( ); all output takes place as if bytes were written by successive calls to *fputc*( ).

When a stream is *unbuffered*, bytes are intended to appear from the source or at the destination as soon as possible; otherwise, bytes may be accumulated and transmitted as a block. When a stream is *fully buffered*, bytes are intended to be transmitted as a block when a buffer is filled. When a stream is *line buffered*, bytes are intended to be transmitted as a block when a newline byte is encountered. Furthermore, bytes are intended to be transmitted as a block when a buffer is filled, when input is requested on an unbuffered stream, or when input is requested on a line-buffered stream that requires the transmission of bytes. Support for these characteristics is implementation-defined, and may be affected via *setbuf*( ) and *setvbuf*( ).

A file may be disassociated from a controlling stream by *closing* the file. Output streams are flushed (any unwritten buffer contents are transmitted) before the stream is disassociated from the file. The value of a pointer to a **FILE** object is unspecified after the associated file is closed (including the standard streams).

A file may be subsequently reopened, by the same or another program execution, and its contents reclaimed or modified (if it can be repositioned at its start). If the *main*( ) function returns to its original caller, or if the *exit*( ) function is called, all open files are closed (hence all output streams are flushed) before program termination. Other paths to program termination, such as calling *abort*( ), need not close all files properly.

The address of the **FILE** object used to control a stream may be significant; a copy of a **FILE** object need not necessarily serve in place of the original.

At program start-up, three streams are predefined and need not be opened explicitly: *standard input* (for reading conventional input), *standard output* (for writing conventional output), and *standard error* (for writing diagnostic output). When opened, the standard error stream is not fully buffered; the standard input and standard output streams are fully buffered if and only if the stream can be determined not to refer to an interactive device.

2.5.1 Interaction of File Descriptors and Standard I/O Streams

CX This section describes the interaction of file descriptors and standard I/O streams. This functionality is an extension to the ISO C standard (and the rest of this section is not further CX shaded).

An open file description may be accessed through a file descriptor, which is created using functions such as *open*( ) or *pipe*( ), or through a stream, which is created using functions such as *fopen*( ) or *popen*( ). Either a file descriptor or a stream is called a *handle* on the open file description to which it refers; an open file description may have several handles.

Handles can be created or destroyed by explicit user action, without affecting the underlying open file description. Some of the ways to create them include *fcntl*( ), *dup*( ), *fdopen*( ), *fileno*( ), and *fork*( ). They can be destroyed by at least *fclose*( ), *close*( ), and the *exec* functions.

A file descriptor that is never used in an operation that could affect the file offset (for example, *read*( ), *write*( ), or *lseek*( )) is not considered a handle for this discussion, but could give rise to one (for example, as a consequence of *fdopen*( ), *dup*( ), or *fork*( )). This exception does not include the file descriptor underlying a stream, whether created with *fopen*( ) or *fdopen*( ), so long as it is not used directly by the application to affect the file offset. The *read*( ) and *write*( ) functions implicitly affect the file offset; *lseek*( ) explicitly affects it.

The result of function calls involving any one handle (the *active handle*) is defined elsewhere in this volume of IEEE Std 1003.1-200x, but if two or more handles are used, and any one of them is a stream, the application shall ensure that their actions are coordinated as described below. If this is not done, the result is undefined.

A handle which is a stream is considered to be closed when either an *fclose*( ) or *freopen*( ) is executed on it (the result of *freopen*( ) is a new stream, which cannot be a handle on the same open file description as its previous value), or when the process owning that stream terminates with *exit*( ) or *abort*( ). A file descriptor is closed by *close*( ), *_exit*( ), or the *exec* functions when FD_CLOEXEC is set on that file descriptor.

For a handle to become the active handle, the application shall ensure that the actions below are performed between the last use of the handle (the current active handle) and the first use of the second handle (the future active handle). The second handle then becomes the active handle. All activity by the application affecting the file offset on the first handle shall be suspended until it again becomes the active file handle. (If a stream function has as an underlying function one that affects the file offset, the stream function shall be considered to affect the file offset.)

The handles need not be in the same process for these rules to apply.

Note that after a *fork*( ), two handles exist where one existed before. The application shall ensure that, if both handles can ever be accessed, they are both in a state where the other could become the active handle first. The application shall prepare for a *fork*( ) exactly as if it were a change of active handle. (If the only action performed by one of the processes is one of the *exec* functions or *_exit*( ) (not *exit*( )), the handle is never accessed in that process.)

For the first handle, the first applicable condition below applies. After the actions required below are taken, if the handle is still open, the application can close it.

- If it is a file descriptor, no action is required.

- If the only further action to be performed on any handle to this open file descriptor is to close it, no action need be taken.
- If it is a stream which is unbuffered, no action need be taken.
- If it is a stream which is line buffered, and the last byte written to the stream was a newline (that is, as if a:

  ```
  putc('\n')
  ```

  was the most recent operation on that stream), no action need be taken.
- If it is a stream which is open for writing or appending (but not also open for reading), the application shall either perform an *fflush*( ), or the stream shall be closed.
- If the stream is open for reading and it is at the end of the file (*feof*( ) is true), no action need be taken.
- If the stream is open with a mode that allows reading and the underlying open file description refers to a device that is capable of seeking, the application shall either perform an *fflush*( ), or the stream shall be closed.

Otherwise, the result is undefined.

For the second handle:

- If any previous active handle has been used by a function that explicitly changed the file offset, except as required above for the first handle, the application shall perform an *lseek*( ) or *fseek*( ) (as appropriate to the type of handle) to an appropriate location.

If the active handle ceases to be accessible before the requirements on the first handle, above, have been met, the state of the open file description becomes undefined. This might occur during functions such as a *fork*( ) or *_exit*( ).

The *exec* functions make inaccessible all streams that are open at the time they are called, independent of which streams or file descriptors may be available to the new process image.

When these rules are followed, regardless of the sequence of handles used, implementations shall ensure that an application, even one consisting of several processes, shall yield correct results: no data shall be lost or duplicated when writing, and all data shall be written in order, except as requested by seeks. It is implementation-defined whether, and under what conditions, all input is seen exactly once.

If the rules above are not followed, the result is unspecified.

Each function that operates on a stream is said to have zero or more *underlying functions*. This means that the stream function shares certain traits with the underlying functions, but does not require that there be any relation between the implementations of the stream function and its underlying functions.

2.5.2 Stream Orientation and Encoding Rules

For conformance to the ISO/IEC 9899:1999 standard, the definition of a stream includes an *orientation*. After a stream is associated with an external file, but before any operations are performed on it, the stream is without orientation. Once a wide-character input/output function has been applied to a stream without orientation, the stream shall become *wide-oriented*. Similarly, once a byte input/output function has been applied to a stream without orientation, the stream shall become *byte-oriented*. Only a call to the *freopen*( ) function or the *fwide*( ) function can otherwise alter the orientation of a stream.

A successful call to *freopen*( ) shall remove any orientation. The three predefined streams *standard input*, *standard output*, and *standard error* shall be unoriented at program start-up.

Byte input/output functions cannot be applied to a wide-oriented stream, and wide-character input/output functions cannot be applied to a byte-oriented stream. The remaining stream operations shall not affect and shall not be affected by a stream's orientation, except for the following additional restrictions:

- Binary wide-oriented streams have the file positioning restrictions ascribed to both text and binary streams.
- For wide-oriented streams, after a successful call to a file-positioning function that leaves the file position indicator prior to the end-of-file, a wide-character output function can overwrite a partial character; any file contents beyond the byte(s) written are henceforth undefined.

Each wide-oriented stream has an associated **mbstate_t** object that stores the current parse state of the stream. A successful call to *fgetpos*( ) shall store a representation of the value of this **mbstate_t** object as part of the value of the **fpos_t** object. A later successful call to *fsetpos*( ) using the same stored **fpos_t** value shall restore the value of the associated **mbstate_t** object as well as the position within the controlled stream.

Implementations that support multiple encoding rules associate an encoding rule with the stream. The encoding rule shall be determined by the setting of the *LC_CTYPE* category in the current locale at the time when the stream becomes wide-oriented. If a wide-character input/output function is applied to a byte-oriented stream, the encoding rule used is undefined. As with the stream's orientation, the encoding rule associated with a stream cannot be changed once it has been set, except by a successful call to *freopen*( ) which clears the encoding rule and resets the orientation to unoriented.

Although both text and binary wide-oriented streams are conceptually sequences of wide characters, the external file associated with a wide-oriented stream is a sequence of (possibly multi-byte) characters generalized as follows:

- Multi-byte encodings within files may contain embedded null bytes (unlike multi-byte encodings valid for use internal to the program).
- A file need not begin nor end in the initial shift state.

Moreover, the encodings used for characters may differ among files. Both the nature and choice of such encodings are implementation-defined.

The wide-character input functions read characters from the stream and convert them to wide characters as if they were read by successive calls to the *fgetwc*( ) function. Each conversion shall occur as if by a call to the *mbrtowc*( ) function, with the conversion state described by the stream's CX own **mbstate_t** object, except the encoding rule associated with the stream is used instead of the encoding rule implied by the *LC_CTYPE* category of the current locale.

The wide-character output functions convert wide characters to (possibly multi-byte) characters and write them to the stream as if they were written by successive calls to the *fputwc*( ) function. Each conversion shall occur as if by a call to the *wcrtomb*( ) function, with the conversion state CX described by the stream's own **mbstate_t** object, except the encoding rule associated with the stream is used instead of the encoding rule implied by the *LC_CTYPE* category of the current locale.

An *encoding error* shall occur if the character sequence presented to the underlying *mbrtowc*( ) function does not form a valid (generalized) character, or if the code value passed to the underlying *wcrtomb*( ) function does not correspond to a valid (generalized) character. The wide-character input/output functions and the byte input/output functions store the value of the macro [EILSEQ] in *errno* if and only if an encoding error occurs.

2.6 STREAMS

XSR STREAMS functionality is provided on implementations supporting the XSI STREAMS Option Group. This functionality is dependent on support of the XSI STREAMS option (and the rest of this section is not further shaded for this option).

STREAMS provides a uniform mechanism for implementing networking services and other character-based I/O. The STREAMS function provides direct access to protocol modules. STREAMS modules are unspecified objects. Access to STREAMS modules is provided by interfaces in IEEE Std 1003.1-200x. Creation of STREAMS modules is outside the scope of IEEE Std 1003.1-200x.

A STREAM is typically a full-duplex connection between a process and an open device or pseudo-device. However, since pipes may be STREAMS-based, a STREAM can be a full-duplex connection between two processes. The STREAM itself exists entirely within the implementation and provides a general character I/O function for processes. It optionally includes one or more intermediate processing modules that are interposed between the process end of the STREAM (STREAM head) and a device driver at the end of the STREAM (STREAM end).

STREAMS I/O is based on messages. There are three types of message:

- *Data messages* containing actual data for input or output
- *Control data* containing instructions for the STREAMS modules and underlying implementation
- Other messages, which include file descriptors

The interface between the STREAM and the rest of the implementation is provided by a set of functions at the STREAM head. When a process calls *write*( ), *writev*( ), *putmsg*( ), *putpmsg*( ), or *ioctl*( ), messages are sent down the STREAM, and *read*( ), *readv*( ), *getmsg*( ), or *getpmsg*( ) accepts data from the STREAM and passes it to a process. Data intended for the device at the downstream end of the STREAM is packaged into messages and sent downstream, while data and signals from the device are composed into messages by the device driver and sent upstream to the STREAM head.

When a STREAMS-based device is opened, a STREAM shall be created that contains the STREAM head and the STREAM end (driver). If pipes are STREAMS-based in an implementation, when a pipe is created, two STREAMS shall be created, each containing a STREAM head. Other modules are added to the STREAM using *ioctl*( ). New modules are ‘‘pushed’’ onto the STREAM one at a time in last-in, first-out (LIFO) style, as though the STREAM was a push-down stack.

Priority

Message types are classified according to their queuing priority and may be *normal* (non-priority), *priority*, or *high-priority* messages. A message belongs to a particular priority band that determines its ordering when placed on a queue. Normal messages have a priority band of 0 and shall always be placed at the end of the queue following all other messages in the queue. High-priority messages are always placed at the head of a queue, but shall be discarded if there is already a high-priority message in the queue. Their priority band shall be ignored; they are high-priority by virtue of their type. Priority messages have a priority band greater than 0. Priority messages are always placed after any messages of the same or higher priority. High-priority and priority messages are used to send control and data information outside the normal flow of control. By convention, high-priority messages shall not be affected by flow control. Normal and priority messages have separate flow controls.

Message Parts

A process may access STREAMS messages that contain a data part, control part, or both. The data part is that information which is transmitted over the communication medium and the control information is used by the local STREAMS modules. The other types of messages are used between modules and are not accessible to processes. Messages containing only a data part are accessible via *putmsg*( ), *putpmsg*( ), *getmsg*( ), *getpmsg*( ), *read*( ), *readv*( ), *write*( ), or *writev*( ). Messages containing a control part with or without a data part are accessible via calls to *putmsg*( ), *putpmsg*( ), *getmsg*( ), or *getpmsg*( ).

2.6.1 Accessing STREAMS

A process accesses STREAMS-based files using the standard functions *close*( ), *ioctl*( ), *getmsg*( ), *getpmsg*( ), *open*( ), *pipe*( ), *poll*( ), *putmsg*( ), *putpmsg*( ), *read*( ), or *write*( ). Refer to the applicable function definitions for general properties and errors.

Calls to *ioctl*( ) shall perform control functions on the STREAM associated with the file descriptor *fildes*. The control functions may be performed by the STREAM head, a STREAMS module, or the STREAMS driver for the STREAM.

STREAMS modules and drivers can detect errors, sending an error message to the STREAM head, thus causing subsequent functions to fail and set *errno* to the value specified in the message. In addition, STREAMS modules and drivers can elect to fail a particular *ioctl*( ) request alone by sending a negative acknowledgement message to the STREAM head. This shall cause just the pending *ioctl*( ) request to fail and set *errno* to the value specified in the message.

2.7 XSI Interprocess Communication

XSI This section describes extensions to support interprocess communication. This functionality is dependent on support of the XSI Extension (and the rest of this section is not further shaded for this option).

The following message passing, semaphore, and shared memory services form an XSI interprocess communication facility. Certain aspects of their operation are common, and are described below.

IPC Functions		
msgctl( )	*semctl*( )	*shmctl*( )
msgget( )	*semget*( )	*shmdt*( )
msgrcv( )	*semop*( )	*shmget*( )
msgsnd( )	*shmat*( )	

Another interprocess communication facility is provided by functions in the Realtime Option Group; see Section 2.8 (on page 491).

2.7.1 IPC General Description

Each individual shared memory segment, message queue, and semaphore set shall be identified by a unique positive integer, called, respectively, a shared memory identifier, *shmid*, a semaphore identifier, *semid*, and a message queue identifier, *msqid*. The identifiers shall be returned by calls to *shmget*( ), *semget*( ), and *msgget*( ), respectively.

Associated with each identifier is a data structure which contains data related to the operations which may be or may have been performed; see the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/shm.h>**, **<sys/sem.h>**, and **<sys/msg.h>** for their descriptions.

Each of the data structures contains both ownership information and an **ipc_perm** structure (see the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/ipc.h>**) which are used in conjunction to determine whether or not read/write (read/alter for semaphores) permissions should be granted to processes using the IPC facilities. The *mode* member of the **ipc_perm** structure acts as a bit field which determines the permissions.

The values of the bits are given below in octal notation.

Bit	Meaning
0400	Read by user.
0200	Write by user.
0040	Read by group.
0020	Write by group.
0004	Read by others.
0002	Write by others.

The name of the **ipc_perm** structure is *shm_perm*, *sem_perm*, or *msg_perm*, depending on which service is being used. In each case, read and write/alter permissions shall be granted to a process if one or more of the following are true ("xxx" is replaced by *shm*, *sem*, or *msg*, as appropriate):

- The process has appropriate privileges.
- The effective user ID of the process matches *xxx_perm.cuid* or *xxx_perm.uid* in the data structure associated with the IPC identifier, and the appropriate bit of the *user* field in *xxx_perm.mode* is set.
- The effective user ID of the process does not match *xxx_perm.cuid* or *xxx_perm.uid* but the effective group ID of the process matches *xxx_perm.cgid* or *xxx_perm.gid* in the data structure associated with the IPC identifier, and the appropriate bit of the *group* field in *xxx_perm.mode* is set.
- The effective user ID of the process does not match *xxx_perm.cuid* or *xxx_perm.uid* and the effective group ID of the process does not match *xxx_perm.cgid* or *xxx_perm.gid* in the data structure associated with the IPC identifier, but the appropriate bit of the *other* field in *xxx_perm.mode* is set.

Otherwise, the permission shall be denied.

2.8 Realtime

This section defines functions to support the source portability of applications with realtime requirements. The presence of many of these functions is dependent on support for implementation options described in the text.

The specific functional areas included in this section and their scope include the following. Full definitions of these terms can be found in the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 3, Definitions.

- Semaphores
- Process Memory Locking
- Memory Mapped Files and Shared Memory Objects
- Priority Scheduling
- Realtime Signal Extension
- Timers
- Interprocess Communication
- Synchronized Input and Output
- Asynchronous Input and Output

All the realtime functions defined in this volume of IEEE Std 1003.1-200x are portable, although some of the numeric parameters used by an implementation may have hardware dependencies.

2.8.1 Realtime Signals

RTS Realtime signal generation and delivery is dependent on support for the Realtime Signals Extension option.

See Section 2.4.2 (on page 479).

2.8.2 Asynchronous I/O

AIO The functionality described in this section is dependent on support of the Asynchronous Input and Output option (and the rest of this section is not further shaded for this option).

An asynchronous I/O control block structure **aiocb** is used in many asynchronous I/O functions. It is defined in the Base Definitions volume of IEEE Std 1003.1-200x, **<aio.h>** and has at least the following members:

Member Type	Member Name	Description
int	*aio_fildes*	File descriptor.
off_t	*aio_offset*	File offset.
volatile void*	*aio_buf*	Location of buffer.
size_t	*aio_nbytes*	Length of transfer.
int	*aio_reqprio*	Request priority offset.
struct sigevent	*aio_sigevent*	Signal number and value.
int	*aio_lio_opcode*	Operation to be performed.

The *aio_fildes* element is the file descriptor on which the asynchronous operation is performed.

If O_APPEND is not set for the file descriptor *aio_fildes* and if *aio_fildes* is associated with a device that is capable of seeking, then the requested operation takes place at the absolute position in the file as given by *aio_offset*, as if *lseek*( ) were called immediately prior to the operation with an *offset* argument equal to *aio_offset* and a *whence* argument equal to SEEK_SET. If O_APPEND is set for the file descriptor, or if *aio_fildes* is associated with a device that is incapable of seeking, write operations append to the file in the same order as the calls were made, with the following exception: under implementation-defined circumstances, such as operation on a multi-processor or when requests of differing priorities are submitted at the same time, the ordering restriction may be relaxed. Since there is no way for a strictly conforming application to determine whether this relaxation applies, all strictly conforming applications which rely on ordering of output shall be written in such a way that they will operate correctly if the relaxation applies. After a successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file is unspecified. The *aio_nbytes* and *aio_buf* elements are the same as the *nbyte* and *buf* arguments defined by *read*( ) and *write*( ), respectively.

If _POSIX_PRIORITIZED_IO and _POSIX_PRIORITY_SCHEDULING are defined, then asynchronous I/O is queued in priority order, with the priority of each asynchronous operation based on the current scheduling priority of the calling process. The *aio_reqprio* member can be used to lower (but not raise) the asynchronous I/O operation priority and is within the range zero through {AIO_PRIO_DELTA_MAX}, inclusive. Unless both _POSIX_PRIORITIZED_IO and _POSIX_PRIORITY_SCHEDULING are defined, the order of processing asynchronous I/O requests is unspecified. When both _POSIX_PRIORITIZED_IO and _POSIX_PRIORITY_SCHEDULING are defined, the order of processing of requests submitted by processes whose schedulers are not SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC is unspecified. The priority of an asynchronous request is computed as (process scheduling priority) minus *aio_reqprio*. The priority assigned to each asynchronous I/O request is an indication of the desired order of execution of the request relative to other asynchronous I/O requests for this file. If _POSIX_PRIORITIZED_IO is defined, requests issued with the same priority to a character special file are processed by the underlying device in FIFO order; the order of processing of requests of the same priority issued to files that are not character special files is unspecified. Numerically higher priority values indicate requests of higher priority. The value of *aio_reqprio* has no effect on process scheduling priority. When prioritized asynchronous I/O requests to the same file are blocked waiting for a resource required for that I/O operation, the higher-priority I/O requests shall be granted the resource before lower-priority I/O requests are granted the resource. The relative priority of asynchronous I/O and synchronous I/O is implementation-defined. If _POSIX_PRIORITIZED_IO is defined, the implementation shall define for which files I/O prioritization is supported.

The *aio_sigevent* determines how the calling process shall be notified upon I/O completion, as specified in Section 2.4.1 (on page 478). If *aio_sigevent.sigev_notify* is SIGEV_NONE, then no signal shall be posted upon I/O completion, but the error status for the operation and the return status for the operation shall be set appropriately.

The *aio_lio_opcode* field is used only by the *lio_listio*( ) call. The *lio_listio*( ) call allows multiple asynchronous I/O operations to be submitted at a single time. The function takes as an argument an array of pointers to **aiocb** structures. Each **aiocb** structure indicates the operation to be performed (read or write) via the *aio_lio_opcode* field.

The address of the **aiocb** structure is used as a handle for retrieving the error status and return status of the asynchronous operation while it is in progress.

The **aiocb** structure and the data buffers associated with the asynchronous I/O operation are being used by the system for asynchronous I/O while, and only while, the error status of the asynchronous operation is equal to [EINPROGRESS]. Applications shall not modify the **aiocb** structure while the structure is being used by the system for asynchronous I/O.

The return status of the asynchronous operation is the number of bytes transferred by the I/O operation. If the error status is set to indicate an error completion, then the return status is set to the return value that the corresponding *read*( ), *write*( ), or *fsync*( ) call would have returned. When the error status is not equal to [EINPROGRESS], the return status shall reflect the return status of the corresponding synchronous operation.

2.8.3 Memory Management

2.8.3.1 Memory Locking

ML The functionality described in this section is dependent on support of the Process Memory Locking option (and the rest of this section is not further shaded for this option).

Range memory locking operations are defined in terms of pages. Implementations may restrict the size and alignment of range lockings to be on page-size boundaries. The page size, in bytes, is the value of the configurable system variable {PAGESIZE}. If an implementation has no restrictions on size or alignment, it may specify a 1-byte page size.

Memory locking guarantees the residence of portions of the address space. It is implementation-defined whether locking memory guarantees fixed translation between virtual addresses (as seen by the process) and physical addresses. Per-process memory locks are not inherited across a *fork*( ), and all memory locks owned by a process are unlocked upon *exec* or process termination. Unmapping of an address range removes any memory locks established on that address range by this process.

2.8.3.2 Memory Mapped Files

MF The functionality described in this section is dependent on support of the Memory Mapped Files option (and the rest of this section is not further shaded for this option).

Range memory mapping operations are defined in terms of pages. Implementations may restrict the size and alignment of range mappings to be on page-size boundaries. The page size, in bytes, is the value of the configurable system variable {PAGESIZE}. If an implementation has no restrictions on size or alignment, it may specify a 1-byte page size.

Memory mapped files provide a mechanism that allows a process to access files by directly incorporating file data into its address space. Once a file is mapped into a process address space, the data can be manipulated as memory. If more than one process maps a file, its contents are shared among them. If the mappings allow shared write access, then data written into the memory object through the address space of one process appears in the address spaces of all processes that similarly map the same portion of the memory object.

SHM Shared memory objects are named regions of storage that may be independent of the file system and can be mapped into the address space of one or more processes to allow them to share the associated memory.

SHM An *unlink*( ) of a file or *shm_unlink*( ) of a shared memory object, while causing the removal of the name, does not unmap any mappings established for the object. Once the name has been removed, the contents of the memory object are preserved as long as it is referenced. The memory object remains referenced as long as a process has the memory object open or has some area of the memory object mapped.

2.8.3.3 Memory Protection

MPR MF The functionality described in this section is dependent on support of the Memory Protection and Memory Mapped Files option (and the rest of this section is not further shaded for these options).

When an object is mapped, various application accesses to the mapped region may result in signals. In this context, SIGBUS is used to indicate an error using the mapped object, and SIGSEGV is used to indicate a protection violation or misuse of an address:

- A mapping may be restricted to disallow some types of access.
- Write attempts to memory that was mapped without write access, or any access to memory mapped PROT_NONE, shall result in a SIGSEGV signal.
- References to unmapped addresses shall result in a SIGSEGV signal.
- Reference to whole pages within the mapping, but beyond the current length of the object, shall result in a SIGBUS signal.
- The size of the object is unaffected by access beyond the end of the object (even if a SIGBUS is not generated).

2.8.3.4 Typed Memory Objects

TYM The functionality described in this section is dependent on support of the Typed Memory Objects option (and the rest of this section is not further shaded for this option).

Implementations may support the Typed Memory Objects option without supporting the Memory Mapped Files option or the Shared Memory Objects option. Typed memory objects are implementation-configurable named storage pools accessible from one or more processors in a system, each via one or more ports, such as backplane buses, LANs, I/O channels, and so on. Each valid combination of a storage pool and a port is identified through a name that is defined at system configuration time, in an implementation-defined manner; the name may be independent of the file system. Using this name, a typed memory object can be opened and mapped into process address space. For a given storage pool and port, it is necessary to support both dynamic allocation from the pool as well as mapping at an application-supplied offset within the pool; when dynamic allocation has been performed, subsequent deallocation must be supported. Lastly, accessing typed memory objects from different ports requires a method for obtaining the offset and length of contiguous storage of a region of typed memory (dynamically allocated or not); this allows typed memory to be shared among processes and/or processors while being accessed from the desired port.

2.8.4 Process Scheduling

PS The functionality described in this section is dependent on support of the Process Scheduling option (and the rest of this section is not further shaded for this option).

Scheduling Policies

The scheduling semantics described in this volume of IEEE Std 1003.1-200x are defined in terms of a conceptual model that contains a set of thread lists. No implementation structures are necessarily implied by the use of this conceptual model. It is assumed that no time elapses during operations described using this model, and therefore no simultaneous operations are possible. This model discusses only processor scheduling for runnable threads, but it should be noted that greatly enhanced predictability of realtime applications results if the sequencing of other resources takes processor scheduling policy into account.

There is, conceptually, one thread list for each priority. A runnable thread will be on the thread list for that thread's priority. Multiple scheduling policies shall be provided. Each non-empty thread list is ordered, contains a head as one end of its order, and a tail as the other. The purpose of a scheduling policy is to define the allowable operations on this set of lists (for example, moving threads between and within lists).

Each process shall be controlled by an associated scheduling policy and priority. These parameters may be specified by explicit application execution of the *sched_setscheduler*( ) or *sched_setparam*( ) functions.

Each thread shall be controlled by an associated scheduling policy and priority. These parameters may be specified by explicit application execution of the *pthread_setschedparam*( ) function.

Associated with each policy is a priority range. Each policy definition shall specify the minimum priority range for that policy. The priority ranges for each policy may but need not overlap the priority ranges of other policies.

A conforming implementation shall select the thread that is defined as being at the head of the highest priority non-empty thread list to become a running thread, regardless of its associated policy. This thread is then removed from its thread list.

Four scheduling policies are specifically required. Other implementation-defined scheduling policies may be defined. The following symbols are defined in the Base Definitions volume of IEEE Std 1003.1-200x, **<sched.h>**:

SCHED_FIFO	First in, first out (FIFO) scheduling policy.
SCHED_RR	Round robin scheduling policy.
SS SCHED_SPORADIC	Sporadic server scheduling policy.
SCHED_OTHER	Another scheduling policy.

The values of these symbols shall be distinct.

SCHED_FIFO

Conforming implementations shall include a scheduling policy called the FIFO scheduling policy.

Threads scheduled under this policy are chosen from a thread list that is ordered by the time its threads have been on the list without being executed; generally, the head of the list is the thread that has been on the list the longest time, and the tail is the thread that has been on the list the shortest time.

Under the SCHED_FIFO policy, the modification of the definitional thread lists is as follows:

1. When a running thread becomes a preempted thread, it becomes the head of the thread list for its priority.
2. When a blocked thread becomes a runnable thread, it becomes the tail of the thread list for its priority.
3. When a running thread calls the *sched_setscheduler*( ) function, the process specified in the function call is modified to the specified policy and the priority specified by the *param* argument.
4. When a running thread calls the *sched_setparam*( ) function, the priority of the process specified in the function call is modified to the priority specified by the *param* argument.

5. When a running thread calls the *pthread_setschedparam*( ) function, the thread specified in the function call is modified to the specified policy and the priority specified by the *param* argument.

6. When a running thread calls the *pthread_setschedprio*( ) function, the thread specified in the function call is modified to the priority specified by the *prio* argument.

7. If a thread whose policy or priority has been modified other than by *pthread_setschedprio*( ) is a running thread or is runnable, it then becomes the tail of the thread list for its new priority.

8. If a thread whose policy or priority has been modified by *pthread_setschedprio*( ) is a running thread or is runnable, the effect on its position in the thread list depends on the direction of the modification, as follows:
    a. If the priority is raised, the thread becomes the tail of the thread list.
    b. If the priority is unchanged, the thread does not change position in the thread list.
    c. If the priority is lowered, the thread becomes the head of the thread list.

9. When a running thread issues the *sched_yield*( ) function, the thread becomes the tail of the thread list for its priority.

10. At no other time is the position of a thread with this scheduling policy within the thread lists affected.

For this policy, valid priorities shall be within the range returned by the *sched_get_priority_max*( ) and *sched_get_priority_min*( ) functions when SCHED_FIFO is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 priorities for this policy.

SCHED_RR

Conforming implementations shall include a scheduling policy called the *round robin* scheduling policy. This policy shall be identical to the SCHED_FIFO policy with the additional condition that when the implementation detects that a running thread has been executing as a running thread for a time period of the length returned by the *sched_rr_get_interval*( ) function or longer, the thread shall become the tail of its thread list and the head of that thread list shall be removed and made a running thread.

The effect of this policy is to ensure that if there are multiple SCHED_RR threads at the same priority, one of them does not monopolize the processor. An application should not rely only on the use of SCHED_RR to ensure application progress among multiple threads if the application includes threads using the SCHED_FIFO policy at the same or higher priority levels or SCHED_RR threads at a higher priority level.

A thread under this policy that is preempted and subsequently resumes execution as a running thread completes the unexpired portion of its round robin interval time period.

For this policy, valid priorities shall be within the range returned by the *sched_get_priority_max*( ) and *sched_get_priority_min*( ) functions when SCHED_RR is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 priorities for this policy.

SCHED_SPORADIC

SS|TSP The functionality described in this section is dependent on support of the Process Sporadic Server or Thread Sporadic Server options (and the rest of this section is not further shaded for these options).

If _POSIX_SPORADIC_SERVER or _POSIX_THREAD_SPORADIC_SERVER is defined, the implementation shall include a scheduling policy identified by the value SCHED_SPORADIC.

The sporadic server policy is based primarily on two parameters: the *replenishment period* and the *available execution capacity*. The replenishment period is given by the *sched_ss_repl_period* member of the **sched_param** structure. The available execution capacity is initialized to the value given by the *sched_ss_init_budget* member of the same parameter. The sporadic server policy is identical to the SCHED_FIFO policy with some additional conditions that cause the thread's assigned priority to be switched between the values specified by the *sched_priority* and *sched_ss_low_priority* members of the **sched_param** structure.

The priority assigned to a thread using the sporadic server scheduling policy is determined in the following manner: if the available execution capacity is greater than zero and the number of pending replenishment operations is strictly less than *sched_ss_max_repl*, the thread is assigned the priority specified by *sched_priority*; otherwise, the assigned priority shall be *sched_ss_low_priority*. If the value of *sched_priority* is less than or equal to the value of *sched_ss_low_priority*, the results are undefined. When active, the thread shall belong to the thread list corresponding to its assigned priority level, according to the mentioned priority assignment. The modification of the available execution capacity and, consequently of the assigned priority, is done as follows:

1. When the thread at the head of the *sched_priority* list becomes a running thread, its execution time shall be limited to at most its available execution capacity, plus the resolution of the execution time clock used for this scheduling policy. This resolution shall be implementation-defined.

2. Each time the thread is inserted at the tail of the list associated with *sched_priority*—because as a blocked thread it became runnable with priority *sched_priority* or because a replenishment operation was performed—the time at which this operation is done is posted as the *activation_time*.

3. When the running thread with assigned priority equal to *sched_priority* becomes a preempted thread, it becomes the head of the thread list for its priority, and the execution time consumed is subtracted from the available execution capacity. If the available execution capacity would become negative by this operation, it shall be set to zero.

4. When the running thread with assigned priority equal to *sched_priority* becomes a blocked thread, the execution time consumed is subtracted from the available execution capacity, and a replenishment operation is scheduled, as described in 6 and 7. If the available execution capacity would become negative by this operation, it shall be set to zero.

5. When the running thread with assigned priority equal to *sched_priority* reaches the limit imposed on its execution time, it becomes the tail of the thread list for *sched_ss_low_priority*, the execution time consumed is subtracted from the available execution capacity (which becomes zero), and a replenishment operation is scheduled, as described in 6 and 7.

6. Each time a replenishment operation is scheduled, the amount of execution capacity to be replenished, *replenish_amount*, is set equal to the execution time consumed by the thread since the *activation_time*. The replenishment is scheduled to occur at *activation_time* plus *sched_ss_repl_period*. If the scheduled time obtained is before the current time, the

replenishment operation is carried out immediately. Several replenishment operations may be pending at the same time, each of which will be serviced at its respective scheduled time. With the above rules, the number of replenishment operations simultaneously pending for a given thread that is scheduled under the sporadic server policy shall not be greater than *sched_ss_max_repl*.

7. A replenishment operation consists of adding the corresponding *replenish_amount* to the available execution capacity at the scheduled time. If, as a consequence of this operation, the execution capacity would become larger than *sched_ss_initial_budget*, it shall be rounded down to a value equal to *sched_ss_initial_budget*. Additionally, if the thread was runnable or running, and had assigned priority equal to *sched_ss_low_priority*, then it becomes the tail of the thread list for *sched_priority*.

Execution time is defined in Section 2.2.2 (on page 464).

For this policy, changing the value of a CPU-time clock via *clock_settime*( ) shall have no effect on its behavior.

For this policy, valid priorities shall be within the range returned by the *sched_get_priority_min*( ) and *sched_get_priority_max*( ) functions when SCHED_SPORADIC is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 distinct priorities for this policy.

SCHED_OTHER

Conforming implementations shall include one scheduling policy identified as SCHED_OTHER (which may execute identically with either the FIFO or round robin scheduling policy). The effect of scheduling threads with the SCHED_OTHER policy in a system in which other threads SS are executing under SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC is implementation-defined.

This policy is defined to allow strictly conforming applications to be able to indicate in a portable manner that they no longer need a realtime scheduling policy.

For threads executing under this policy, the implementation shall use only priorities within the range returned by the *sched_get_priority_max*( ) and *sched_get_priority_min*( ) functions when SCHED_OTHER is provided as the parameter.

2.8.5 Clocks and Timers

TMR The functionality described in this section is dependent on support of the Timers option (and the rest of this section is not further shaded for this option).

The **<time.h>** header defines the types and manifest constants used by the timing facility.

Time Value Specification Structures

Many of the timing facility functions accept or return time value specifications. A time value structure **timespec** specifies a single time value and includes at least the following members:

Member Type	Member Name	Description
time_t	*tv_sec*	Seconds.
long	*tv_nsec*	Nanoseconds.

The *tv_nsec* member is only valid if greater than or equal to zero, and less than the number of nanoseconds in a second (1,000 million). The time interval described by this structure is ($tv\_sec * 10^9 + tv\_nsec$) nanoseconds.

A time value structure **itimerspec** specifies an initial timer value and a repetition interval for use by the per-process timer functions. This structure includes at least the following members:

Member Type	Member Name	Description
struct timespec	*it_interval*	Timer period.
struct timespec	*it_value*	Timer expiration.

If the value described by *it_value* is non-zero, it indicates the time to or time of the next timer expiration (for relative and absolute timer values, respectively). If the value described by *it_value* is zero, the timer shall be disarmed.

If the value described by *it_interval* is non-zero, it specifies an interval which shall be used in reloading the timer when it expires; that is, a periodic timer is specified. If the value described by *it_interval* is zero, the timer is disarmed after its next expiration; that is, a one-shot timer is specified. |

Timer Event Notification Control Block

RTS Per-process timers may be created that notify the process of timer expirations by queuing a realtime extended signal. The **sigevent** structure, defined in the Base Definitions volume of IEEE Std 1003.1-200x, **<signal.h>**, is used in creating such a timer. The **sigevent** structure contains the signal number and an application-specific data value which shall be used when notifying the calling process of timer expiration events. |

Manifest Constants

The following constants are defined in the Base Definitions volume of IEEE Std 1003.1-200x, **<time.h>**:

CLOCK_REALTIME	The identifier for the system-wide realtime clock.
TIMER_ABSTIME	Flag indicating time is absolute with respect to the clock associated with a timer.
MON CLOCK_MONOTONIC	The identifier for the system-wide monotonic clock, which is defined as a clock whose value cannot be set via *clock_settime*( ) and which cannot have backward clock jumps. The maximum possible clock jump is implementation-defined.

MON The maximum allowable resolution for CLOCK_REALTIME and CLOCK_MONOTONIC clocks and all time services based on these clocks is represented by {_POSIX_CLOCKRES_MIN} and shall be defined as 20ms (1/50 of a second). Implementations may support smaller values of resolution for these clocks to provide finer granularity time bases. The actual resolution supported by an implementation for a specific clock is obtained using the *clock_getres*( ) function. If the actual resolution supported for a time service based on one of these clocks differs from the resolution supported for that clock, the implementation shall document this difference.

MON The minimum allowable maximum value for CLOCK_REALTIME and CLOCK_MONOTONIC clocks and all absolute time services based on them is the same as that defined by the ISO C standard for the **time_t** type. If the maximum value supported by a time service based on one of these clocks differs from the maximum value supported by that clock, the implementation shall document this difference.

Execution Time Monitoring

CPT If _POSIX_CPUTIME is defined, process CPU-time clocks shall be supported in addition to the clocks described in **Manifest Constants** (on page 499).

TCT If _POSIX_THREAD_CPUTIME is defined, thread CPU-time clocks shall be supported.

CPT|TCT CPU-time clocks measure execution or CPU time, which is defined in the Base Definitions volume of IEEE Std 1003.1-200x, Section 3.117, CPU Time (Execution Time). The mechanism used to measure execution time is described in the Base Definitions volume of IEEE Std 1003.1-200x, Section 4.9, Measurement of Execution Time. |

CPT If _POSIX_CPUTIME is defined, the following constant of the type **clockid_t** is defined in **<time.h>**: |

CLOCK_PROCESS_CPUTIME_ID
When this value of the type **clockid_t** is used in a *clock*( ) or *timer**( ) function call, it is interpreted as the identifier of the CPU-time clock associated with the process making the function call.

TCT If _POSIX_THREAD_CPUTIME is defined, the following constant of the type **clockid_t** is defined in **<time.h>**: |

CLOCK_THREAD_CPUTIME_ID
When this value of the type **clockid_t** is used in a *clock*( ) or *timer**( ) function call, it is interpreted as the identifier of the CPU-time clock associated with the thread making the function call.

2.9 Threads

THR The functionality described in this section is dependent on support of the Threads option (and the rest of this section is not further shaded for this option).

This section defines functionality to support multiple flows of control, called *threads*, within a process. For the definition of *threads*, see the Base Definitions volume of IEEE Std 1003.1-200x, Section 3.393, Thread.

The specific functional areas covered by threads and their scope include:

- Thread management: the creation, control, and termination of multiple flows of control in the same process under the assumption of a common shared address space
- Synchronization primitives optimized for tightly coupled operation of multiple control flows in a common, shared address space

2.9.1 Thread-Safety

All functions defined by this volume of IEEE Std 1003.1-200x shall be thread-safe, except that the following functions[1] need not be thread-safe.

---

[1] The functions in the table are not shaded to denote applicable options. Individual reference pages should be consulted.

asctime( )

The *ctermid*( ) and *tmpnam*( ) functions need not be thread-safe if passed a NULL argument. The *wcrtomb*( ) and *wcsrtombs*( ) functions need not be thread-safe if passed a NULL *ps* argument.

Implementations shall provide internal synchronization as necessary in order to satisfy this requirement.

2.9.2 Thread IDs

Although implementations may have thread IDs that are unique in a system, applications should only assume that thread IDs are usable and unique within a single process. The effect of calling any of the functions defined in this volume of IEEE Std 1003.1-200x and passing as an argument the thread ID of a thread from another process is unspecified. A conforming implementation is free to reuse a thread ID after the thread terminates if it was created with the *detachstate* attribute set to PTHREAD_CREATE_DETACHED or if *pthread_detach*( ) or *pthread_join*( ) has been called for that thread. If a thread is detached, its thread ID is invalid for use as an argument in a call to *pthread_detach*( ) or *pthread_join*( ).

2.9.3 Thread Mutexes

A thread that has blocked shall not prevent any unblocked thread that is eligible to use the same processing resources from eventually making forward progress in its execution. Eligibility for processing resources is determined by the scheduling policy.

A thread shall become the owner of a mutex, *m*, when one of the following occurs:

- It returns successfully from *pthread_mutex_lock*( ) with *m* as the *mutex* argument.
- It returns successfully from *pthread_mutex_trylock*( ) with *m* as the *mutex* argument.
- TMO It returns successfully from *pthread_mutex_timedwait*( ) with *m* as the mutex argument.
- It returns (successfully or not) from *pthread_cond_wait*( ) with *m* as the *mutex* argument (except as explicitly indicated otherwise for certain errors).
- It returns (successfully or not) from *pthread_cond_timedwait*( ) with *m* as the *mutex* argument (except as explicitly indicated otherwise for certain errors).

The thread shall remain the owner of *m* until one of the following occurs:

- It executes *pthread_mutex_unlock*( ) with *m* as the *mutex* argument
- It blocks in a call to *pthread_cond_wait*( ) with *m* as the *mutex* argument.
- It blocks in a call to *pthread_cond_timedwait*( ) with *m* as the *mutex* argument.

The implementation shall behave as if at all times there is at most one owner of any mutex.

A thread that becomes the owner of a mutex is said to have *acquired* the mutex and the mutex is said to have become *locked*; when a thread gives up ownership of a mutex it is said to have *released* the mutex and the mutex is said to have become *unlocked*.

2.9.4 Thread Scheduling

TPS The functionality described in this section is dependent on support of the Thread Execution Scheduling option (and the rest of this section is not further shaded for this option).

Thread Scheduling Attributes

In support of the scheduling function, threads have attributes which are accessed through the **pthread_attr_t** thread creation attributes object.

The *contentionscope* attribute defines the scheduling contention scope of the thread to be either PTHREAD_SCOPE_PROCESS or PTHREAD_SCOPE_SYSTEM.

The *inheritsched* attribute specifies whether a newly created thread is to inherit the scheduling attributes of the creating thread or to have its scheduling values set according to the other scheduling attributes in the **pthread_attr_t** object.

The *schedpolicy* attribute defines the scheduling policy for the thread. The *schedparam* attribute defines the scheduling parameters for the thread. The interaction of threads having different policies within a process is described as part of the definition of those policies.

If the Thread Execution Scheduling option is defined, and the *schedpolicy* attribute specifies one of the priority-based policies defined under this option, the *schedparam* attribute contains the scheduling priority of the thread. A conforming implementation ensures that the priority value in *schedparam* is in the range associated with the scheduling policy when the thread attributes object is used to create a thread, or when the scheduling attributes of a thread are dynamically modified. The meaning of the priority value in *schedparam* is the same as that of *priority*.

TSP If _POSIX_THREAD_SPORADIC_SERVER is defined, the *schedparam* attribute supports four new members that are used for the sporadic server scheduling policy. These members are *sched_ss_low_priority*, *sched_ss_repl_period*, *sched_ss_init_budget*, and *sched_ss_max_repl*. The meaning of these attributes is the same as in the definitions that appear under Section 2.8.4 (on page 494).

When a process is created, its single thread has a scheduling policy and associated attributes equal to the process' policy and attributes. The default scheduling contention scope value is implementation-defined. The default values of other scheduling attributes are implementation-defined.

Thread Scheduling Contention Scope

The scheduling contention scope of a thread defines the set of threads with which the thread competes for use of the processing resources. The scheduling operation selects at most one thread to execute on each processor at any point in time and the thread's scheduling attributes (for example, *priority*), whether under process scheduling contention scope or system scheduling contention scope, are the parameters used to determine the scheduling decision.

The scheduling contention scope, in the context of scheduling a mixed scope environment, affects threads as follows:

- A thread created with PTHREAD_SCOPE_SYSTEM scheduling contention scope contends for resources with all other threads in the same scheduling allocation domain relative to their system scheduling attributes. The system scheduling attributes of a thread created with PTHREAD_SCOPE_SYSTEM scheduling contention scope are the scheduling attributes with which the thread was created. The system scheduling attributes of a thread created with PTHREAD_SCOPE_PROCESS scheduling contention scope are the implementation-defined mapping into system attribute space of the scheduling attributes with which the thread was created.
- Threads created with PTHREAD_SCOPE_PROCESS scheduling contention scope contend directly with other threads within their process that were created with PTHREAD_SCOPE_PROCESS scheduling contention scope. The contention is resolved based on the threads' scheduling attributes and policies. It is unspecified how such threads are scheduled relative to threads in other processes or threads with PTHREAD_SCOPE_SYSTEM scheduling contention scope.
- Conforming implementations shall support the PTHREAD_SCOPE_PROCESS scheduling contention scope, the PTHREAD_SCOPE_SYSTEM scheduling contention scope, or both.

Scheduling Allocation Domain

Implementations shall support scheduling allocation domains containing one or more processors. It should be noted that the presence of multiple processors does not automatically indicate a scheduling allocation domain size greater than one. Conforming implementations on multi-processors may map all or any subset of the CPUs to one or multiple scheduling allocation domains, and could define these scheduling allocation domains on a per-thread, per-process, or per-system basis, depending on the types of applications intended to be supported by the implementation. The scheduling allocation domain is independent of scheduling contention scope, as the scheduling contention scope merely defines the set of threads with which a thread contends for processor resources, while scheduling allocation domain defines the set of processors for which it contends. The semantics of how this contention is resolved among threads for processors is determined by the scheduling policies of the threads.

The choice of scheduling allocation domain size and the level of application control over scheduling allocation domains is implementation-defined. Conforming implementations may change the size of scheduling allocation domains and the binding of threads to scheduling allocation domains at any time.

For application threads with scheduling allocation domains of size equal to one, the scheduling rules defined for SCHED_FIFO and SCHED_RR shall be used; see **Scheduling Policies** (on page 494). All threads with system scheduling contention scope, regardless of the processes in which they reside, compete for the processor according to their priorities. Threads with process scheduling contention scope compete only with other threads with process scheduling contention scope within their process.

TSP For application threads with scheduling allocation domains of size greater than one, the rules defined for SCHED_FIFO, SCHED_RR, and SCHED_SPORADIC shall be used in an implementation-defined manner. Each thread with system scheduling contention scope competes for the processors in its scheduling allocation domain in an implementation-defined manner according to its priority. Threads with process scheduling contention scope are scheduled relative to other threads within the same scheduling contention scope in the process.

TSP If _POSIX_THREAD_SPORADIC_SERVER is defined, the rules defined for SCHED_SPORADIC in **Scheduling Policies** (on page 494) shall be used in an implementation-defined manner for application threads whose scheduling allocation domain size is greater than one.

Scheduling Documentation

TSP If _POSIX_PRIORITY_SCHEDULING is defined, then any scheduling policies beyond SCHED_OTHER, SCHED_FIFO, SCHED_RR, and SCHED_SPORADIC, as well as the effects of the scheduling policies indicated by these other values, and the attributes required in order to support such a policy, are implementation-defined. Furthermore, the implementation shall document the effect of all processor scheduling allocation domain values supported for these policies.

2.9.5 Thread Cancelation

The thread cancelation mechanism allows a thread to terminate the execution of any other thread in the process in a controlled manner. The target thread (that is, the one that is being canceled) is allowed to hold cancelation requests pending in a number of ways and to perform application-specific cleanup processing when the notice of cancelation is acted upon.

Cancelation is controlled by the cancelation control functions. Each thread maintains its own cancelability state. Cancelation may only occur at cancelation points or when the thread is asynchronously cancelable.

The thread cancelation mechanism described in this section depends upon programs having set *deferred cancelability* state, which is specified as the default. Applications shall also carefully follow static lexical scoping rules in their execution behavior. For example, use of *setjmp*( ), *return*, *goto*, and so on, to leave user-defined cancelation scopes without doing the necessary scope pop operation results in undefined behavior.

Use of asynchronous cancelability while holding resources which potentially need to be released may result in resource loss. Similarly, cancelation scopes may only be safely manipulated (pushed and popped) when the thread is in the *deferred* or *disabled* cancelability states.

2.9.5.1 Cancelability States

The cancelability state of a thread determines the action taken upon receipt of a cancelation request. The thread may control cancelation in a number of ways.

Each thread maintains its own cancelability state, which may be encoded in two bits:

1. Cancelability-Enable: When cancelability is PTHREAD_CANCEL_DISABLE (as defined in the Base Definitions volume of IEEE Std 1003.1-200x, **<pthread.h>**), cancelation requests against the target thread are held pending. By default, cancelability is set to PTHREAD_CANCEL_ENABLE (as defined in **<pthread.h>**).

2. Cancelability Type: When cancelability is enabled and the cancelability type is PTHREAD_CANCEL_ASYNCHRONOUS (as defined in **<pthread.h>**), new or pending cancelation requests may be acted upon at any time. When cancelability is enabled and the cancelability type is PTHREAD_CANCEL_DEFERRED (as defined in **<pthread.h>**),

cancelation requests are held pending until a cancelation point (see below) is reached. If cancelability is disabled, the setting of the cancelability type has no immediate effect as all cancelation requests are held pending; however, once cancelability is enabled again the new type is in effect. The cancelability type is PTHREAD_CANCEL_DEFERRED in all newly created threads including the thread in which *main*( ) was first invoked.

2.9.5.2 Cancelation Points

Cancelation points shall occur when a thread is executing the following functions:

accept( )
aio_suspend( )
clock_nanosleep( )
close( )
connect( )
creat( )
fcntl( )[2]
fsync( )

wscanf( )

An implementation shall not introduce cancelation points into any other functions specified in this volume of IEEE Std 1003.1-200x.

---

[3] For any value of the *cmd* argument.

The side effects of acting upon a cancelation request while suspended during a call of a function are the same as the side effects that may be seen in a single-threaded program when a call to a function is interrupted by a signal and the given function returns [EINTR]. Any such side effects occur before any cancelation cleanup handlers are called.

Whenever a thread has cancelability enabled and a cancelation request has been made with that thread as the target, and the thread then calls any function that is a cancelation point (such as *pthread_testcancel*( ) or *read*( )), the cancelation request shall be acted upon before the function returns. If a thread has cancelability enabled and a cancelation request is made with the thread as a target while the thread is suspended at a cancelation point, the thread shall be awakened and the cancelation request shall be acted upon. However, if the thread is suspended at a cancelation point and the event for which it is waiting occurs before the cancelation request is acted upon, it is unspecified whether the cancelation request is acted upon or whether the cancelation request remains pending and the thread resumes normal execution.

2.9.5.3 *Thread Cancelation Cleanup Handlers*

Each thread maintains a list of cancelation cleanup handlers. The programmer uses the *pthread_cleanup_push*( ) and *pthread_cleanup_pop*( ) functions to place routines on and remove routines from this list.

When a cancelation request is acted upon, the routines in the list are invoked one by one in LIFO sequence; that is, the last routine pushed onto the list (Last In) is the first to be invoked (First Out). The thread invokes the cancelation cleanup handler with cancelation disabled until the last cancelation cleanup handler returns. When the cancelation cleanup handler for a scope is invoked, the storage for that scope remains valid. If the last cancelation cleanup handler returns, thread execution is terminated and a status of PTHREAD_CANCELED is made available to any threads joining with the target. The symbolic constant PTHREAD_CANCELED expands to a constant expression of type (**void ***) whose value matches no pointer to an object in memory nor the value NULL.

The cancelation cleanup handlers are also invoked when the thread calls *pthread_exit*( ).

A side effect of acting upon a cancelation request while in a condition variable wait is that the mutex is re-acquired before calling the first cancelation cleanup handler. In addition, the thread is no longer considered to be waiting for the condition and the thread shall not have consumed any pending condition signals on the condition.

A cancelation cleanup handler cannot exit via *longjmp*( ) or *siglongjmp*( ).

2.9.5.4 *Async-Cancel Safety*

The *pthread_cancel*( ), *pthread_setcancelstate*( ), and *pthread_setcanceltype*( ) functions are defined to be async-cancel safe.

No other functions in this volume of IEEE Std 1003.1-200x are required to be async-cancel-safe.

2.9.6 Thread Read-Write Locks

Multiple readers, single writer (read-write) locks allow many threads to have simultaneous read-only access to data while allowing only one thread to have exclusive write access at any given time. They are typically used to protect data that is read more frequently than it is changed.

One or more readers acquire read access to the resource by performing a read lock operation on the associated read-write lock. A writer acquires exclusive write access by performing a write lock operation. Basically, all readers exclude any writers and a writer excludes all readers and any other writers.

A thread that has blocked on a read-write lock (for example, has not yet returned from a *pthread_rwlock_rdlock*( ) or *pthread_rwlock_wrlock*( ) call) shall not prevent any unblocked thread that is eligible to use the same processing resources from eventually making forward progress in its execution. Eligibility for processing resources shall be determined by the scheduling policy.

Read-write locks can be used to synchronize threads in the current process and other processes if they are allocated in memory that is writable and shared among the cooperating processes and have been initialized for this behavior.

2.9.7 Thread Interactions with Regular File Operations

All of the functions *chmod*( ), *close*( ), *fchmod*( ), *fcntl*( ), *fstat*( ), *ftruncate*( ), *lseek*( ), *open*( ), *read*( ), *readlink*( ), *stat*( ), *symlink*( ), and *write*( ) shall be atomic with respect to each other in the effects specified in IEEE Std 1003.1-200x when they operate on regular files. If two threads each call one of these functions, each call shall either see all of the specified effects of the other call, or none of them.

2.10 Sockets

A socket is an endpoint for communication using the facilities described in this section. A socket is created with a specific socket type, described in Section 2.10.6 (on page 509), and is associated with a specific protocol, detailed in Section 2.10.3 (on page 509). A socket is accessed via a file descriptor obtained when the socket is created.

2.10.1 Address Families

All network protocols are associated with a specific address family. An address family provides basic services to the protocol implementation to allow it to function within a specific network environment. These services may include packet fragmentation and reassembly, routing, addressing, and basic transport. An address family is normally comprised of a number of protocols, one per socket type. Each protocol is characterized by an abstract socket type. It is not required that an address family support all socket types. An address family may contain multiple protocols supporting the same socket abstraction.

Section 2.10.17 (on page 516), Section 2.10.19 (on page 517), and Section 2.10.20 (on page 517), respectively, describe the use of sockets for local UNIX connections, for Internet protocols based on IPv4, and for Internet protocols based on IPv6.

2.10.2 Addressing

An address family defines the format of a socket address. All network addresses are described using a general structure, called a **sockaddr**, as defined in the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/socket.h>**. However, each address family imposes finer and more specific structure, generally defining a structure with fields specific to the address family. The field *sa_family* in the **sockaddr** structure contains the address family identifier, specifying the format of the *sa_data* area. The size of the *sa_data* area is unspecified.

2.10.3 Protocols

A protocol supports one of the socket abstractions detailed in Section 2.10.6. Selecting a protocol involves specifying the address family, socket type, and protocol number to the *socket*( ) function. Certain semantics of the basic socket abstractions are protocol-specific. All protocols are expected to support the basic model for their particular socket type, but may, in addition, provide non-standard facilities or extensions to a mechanism.

2.10.4 Routing

Sockets provides packet routing facilities. A routing information database is maintained, which is used in selecting the appropriate network interface when transmitting packets.

2.10.5 Interfaces

Each network interface in a system corresponds to a path through which messages can be sent and received. A network interface usually has a hardware device associated with it, though certain interfaces such as the loopback interface, do not.

2.10.6 Socket Types

A socket is created with a specific type, which defines the communication semantics and which allows the selection of an appropriate communication protocol. Four types are defined: RS SOCK_RAW, SOCK_STREAM, SOCK_SEQPACKET, and SOCK_DGRAM. Implementations may specify additional socket types.

The SOCK_STREAM socket type provides reliable, sequenced, full-duplex octet streams between the socket and a peer to which the socket is connected. A socket of type SOCK_STREAM must be in a connected state before any data may be sent or received. Record boundaries are not maintained; data sent on a stream socket using output operations of one size may be received using input operations of smaller or larger sizes without loss of data. Data may be buffered; successful return from an output function does not imply that the data has been delivered to the peer or even transmitted from the local system. If data cannot be successfully transmitted within a given time then the connection is considered broken, and subsequent operations shall fail. A SIGPIPE signal is raised if a thread sends on a broken stream (one that is no longer connected). Support for an out-of-band data transmission facility is protocol-specific.

The SOCK_SEQPACKET socket type is similar to the SOCK_STREAM type, and is also connection-oriented. The only difference between these types is that record boundaries are maintained using the SOCK_SEQPACKET type. A record can be sent using one or more output operations and received using one or more input operations, but a single operation never transfers parts of more than one record. Record boundaries are visible to the receiver via the MSG_EOR flag in the received message flags returned by the *recvmsg*( ) function. It is protocol-specific whether a maximum record size is imposed.

The SOCK_DGRAM socket type supports connectionless data transfer which is not necessarily acknowledged or reliable. Datagrams may be sent to the address specified (possibly multicast or broadcast) in each output operation, and incoming datagrams may be received from multiple sources. The source address of each datagram is available when receiving the datagram. An application may also pre-specify a peer address, in which case calls to output functions shall send to the pre-specified peer. If a peer has been specified, only datagrams from that peer shall be received. A datagram must be sent in a single output operation, and must be received in a single input operation. The maximum size of a datagram is protocol-specific; with some protocols, the limit is implementation-defined. Output datagrams may be buffered within the system; thus, a successful return from an output function does not guarantee that a datagram is actually sent or received. However, implementations should attempt to detect any errors possible before the return of an output function, reporting any error by an unsuccessful return value.

RS The SOCK_RAW socket type is similar to the SOCK_DGRAM type. It differs in that it is normally used with communication providers that underlie those used for the other socket types. For this reason, the creation of a socket with type SOCK_RAW shall require appropriate privilege. The format of datagrams sent and received with this socket type generally include specific protocol headers, and the formats are protocol-specific and implementation-defined.

2.10.7 Socket I/O Mode

The I/O mode of a socket is described by the O_NONBLOCK file status flag which pertains to the open file description for the socket. This flag is initially off when a socket is created, but may be set and cleared by the use of the F_SETFL command of the *fcntl*( ) function.

When the O_NONBLOCK flag is set, functions that would normally block until they are complete shall either return immediately with an error, or shall complete asynchronously to the execution of the calling process. Data transfer operations (the *read*( ), *write*( ), *send*( ), and *recv*( ) functions) shall complete immediately, transfer only as much as is available, and then return without blocking, or return an error indicating that no transfer could be made without blocking. The *connect*( ) function initiates a connection and shall return without blocking when O_NONBLOCK is set; it shall return the error [EINPROGRESS] to indicate that the connection was initiated successfully, but that it has not yet completed.

2.10.8 Socket Owner

The owner of a socket is unset when a socket is created. The owner may be set to a process ID or process group ID using the F_SETOWN command of the *fcntl*( ) function.

2.10.9 Socket Queue Limits

The transmit and receive queue sizes for a socket are set when the socket is created. The default sizes used are both protocol-specific and implementation-defined. The sizes may be changed using the *setsockopt*( ) function.

2.10.10 Pending Error

Errors may occur asynchronously, and be reported to the socket in response to input from the network protocol. The socket stores the pending error to be reported to a user of the socket at the next opportunity. The error is returned in response to a subsequent *send*( ), *recv*( ), or *getsockopt*( ) operation on the socket, and the pending error is then cleared.

2.10.11 Socket Receive Queue

A socket has a receive queue that buffers data when it is received by the system until it is removed by a receive call. Depending on the type of the socket and the communication provider, the receive queue may also contain ancillary data such as the addressing and other protocol data associated with the normal data in the queue, and may contain out-of-band or expedited data. The limit on the queue size includes any normal, out-of-band data, datagram source addresses, and ancillary data in the queue. The description in this section applies to all sockets, even though some elements cannot be present in some instances.

The contents of a receive buffer are logically structured as a series of data segments with associated ancillary data and other information. A data segment may contain normal data or out-of-band data, but never both. A data segment may complete a record if the protocol supports records (always true for types SOCK_SEQPACKET and SOCK_DGRAM). A record may be stored as more than one segment; the complete record might never be present in the receive buffer at one time, as a portion might already have been returned to the application, and another portion might not yet have been received from the communications provider. A data segment may contain ancillary protocol data, which is logically associated with the segment. Ancillary data is received as if it were queued along with the first normal data octet in the segment (if any). A segment may contain ancillary data only, with no normal or out-of-band data. For the purposes of this section, a datagram is considered to be a data segment that terminates a record, and that includes a source address as a special type of ancillary data. Data segments are placed into the queue as data is delivered to the socket by the protocol. Normal data segments are placed at the end of the queue as they are delivered. If a new segment contains the same type of data as the preceding segment and includes no ancillary data, and if the preceding segment does not terminate a record, the segments are logically merged into a single segment.

The receive queue is logically terminated if an end-of-file indication has been received or a connection has been terminated. A segment shall be considered to be terminated if another segment follows it in the queue, if the segment completes a record, or if an end-of-file or other connection termination has been reported. The last segment in the receive queue shall also be considered to be terminated while the socket has a pending error to be reported.

A receive operation shall never return data or ancillary data from more than one segment.

2.10.12 Socket Out-of-Band Data State

The handling of received out-of-band data is protocol-specific. Out-of-band data may be placed in the socket receive queue, either at the end of the queue or before all normal data in the queue. In this case, out-of-band data is returned to an application program by a normal receive call. Out-of-band data may also be queued separately rather than being placed in the socket receive queue, in which case it shall be returned only in response to a receive call that requests out-of-band data. It is protocol-specific whether an out-of-band data mark is placed in the receive queue to demarcate data preceding the out-of-band data and following the out-of-band data. An out-of-band data mark is logically an empty data segment that cannot be merged with other segments in the queue. An out-of-band data mark is never returned in response to an input operation. The *sockatmark*( ) function can be used to test whether an out-of-band data mark is the first element in the queue. If an out-of-band data mark is the first element in the queue when an input function is called without the MSG_PEEK option, the mark is removed from the queue and the following data (if any) is processed as if the mark had not been present.

2.10.13 Connection Indication Queue

Sockets that are used to accept incoming connections maintain a queue of outstanding connection indications. This queue is a list of connections that are awaiting acceptance by the application; see *listen*( ).

2.10.14 Signals

One category of event at the socket interface is the generation of signals. These signals report protocol events or process errors relating to the state of the socket. The generation or delivery of a signal does not change the state of the socket, although the generation of the signal may have been caused by a state change.

The SIGPIPE signal shall be sent to a thread that attempts to send data on a socket that is no longer able to send. In addition, the send operation fails with the error [EPIPE].

If a socket has an owner, the SIGURG signal is sent to the owner of the socket when it is notified of expedited or out-of-band data. The socket state at this time is protocol-dependent, and the status of the socket is specified in Section 2.10.17 (on page 516), Section 2.10.19 (on page 517), and Section 2.10.20 (on page 517). Depending on the protocol, the expedited data may or may not have arrived at the time of signal generation.

2.10.15 Asynchronous Errors

If any of the following conditions occur asynchronously for a socket, the corresponding value listed below shall become the pending error for the socket:

[ECONNABORTED]
The connection was aborted locally.

[ECONNREFUSED]
For a connection-mode socket attempting a non-blocking connection, the attempt to connect was forcefully rejected. For a connectionless-mode socket, an attempt to deliver a datagram was forcefully rejected.

[ECONNRESET]
The peer has aborted the connection.

[EHOSTDOWN]
The destination host has been determined to be down or disconnected.

[EHOSTUNREACH]
The destination host is not reachable.

[EMSGSIZE]
For a connectionless-mode socket, the size of a previously sent datagram prevented delivery.

[ENETDOWN]
The local network connection is not operational.

[ENETRESET]
The connection was aborted by the network.

[ENETUNREACH]
The destination network is not reachable.

2.10.16 Use of Options

There are a number of socket options which either specialize the behavior of a socket or provide useful information. These options may be set at different protocol levels and are always present at the uppermost ‘‘socket’’ level.

Socket options are manipulated by two functions, *getsockopt*( ) and *setsockopt*( ). These functions allow an application program to customize the behavior and characteristics of a socket to provide the desired effect.

All of the options have default values. The type and meaning of these values is defined by the protocol level to which they apply. Instead of using the default values, an application program may choose to customize one or more of the options. However, in the bulk of cases, the default values are sufficient for the application.

Some of the options are used to enable or disable certain behavior within the protocol modules (for example, turn on debugging) while others may be used to set protocol-specific information (for example, IP time-to-live on all the application’s outgoing packets). As each of the options is introduced, its effect on the underlying protocol modules is described.

Table 2-1 shows the value for the socket level.

Table 2-1 Value of Level for Socket Options

Name	Description
SOL_SOCKET	Options are intended for the sockets level.

Table 2-2 (on page 514) lists those options present at the socket level; that is, when the *level* parameter of the *getsockopt*( ) or *setsockopt*( ) function is SOL_SOCKET, the types of the option value parameters associated with each option, and a brief synopsis of the meaning of the option value parameter. Unless otherwise noted, each may be examined with *getsockopt*( ) and set with *setsockopt*( ) on all types of socket.

Table 2-2 Socket-Level Options

Option	Parameter Type	Parameter Meaning
SO_BROADCAST	**int**	Non-zero requests permission to transmit broadcast datagrams (SOCK_DGRAM sockets only).
SO_DEBUG	**int**	Non-zero requests debugging in underlying protocol modules.
SO_DONTROUTE	**int**	Non-zero requests bypass of normal routing; route based on destination address only.
SO_ERROR	**int**	Requests and clears pending error information on the socket (*getsockopt*( ) only).
SO_KEEPALIVE	**int**	Non-zero requests periodic transmission of keepalive messages (protocol-specific).
SO_LINGER	**struct linger**	Specify actions to be taken for queued, unsent data on *close*( ): linger on/off and linger time in seconds.
SO_OOBINLINE	**int**	Non-zero requests that out-of-band data be placed into normal data input queue as received.
SO_RCVBUF	**int**	Size of receive buffer (in bytes).
SO_RCVLOWAT	**int**	Minimum amount of data to return to application for input operations (in bytes).
SO_RCVTIMEO	**struct timeval**	Timeout value for a socket receive operation.
SO_REUSEADDR	**int**	Non-zero requests reuse of local addresses in *bind*( ) (protocol-specific).
SO_SNDBUF	**int**	Size of send buffer (in bytes).
SO_SNDLOWAT	**int**	Minimum amount of data to send for output operations (in bytes).
SO_SNDTIMEO	**struct timeval**	Timeout value for a socket send operation.
SO_TYPE	**int**	Identify socket type (*getsockopt*( ) only).

The SO_BROADCAST option requests permission to send broadcast datagrams on the socket. Support for SO_BROADCAST is protocol-specific. The default for SO_BROADCAST is that the ability to send broadcast datagrams on a socket is disabled.

The SO_DEBUG option enables debugging in the underlying protocol modules. This can be useful for tracing the behavior of the underlying protocol modules during normal system operation. The semantics of the debug reports are implementation-defined. The default value for SO_DEBUG is for debugging to be turned off.

The SO_DONTROUTE option requests that outgoing messages bypass the standard routing facilities. The destination must be on a directly-connected network, and messages are directed to the appropriate network interface according to the destination address. It is protocol-specific whether this option has any effect and how the outgoing network interface is chosen. Support for this option with each protocol is implementation-defined.

The SO_ERROR option is used only on *getsockopt*( ). When this option is specified, *getsockopt*( ) shall return any pending error on the socket and clear the error status. It shall return a value of 0 if there is no pending error. SO_ERROR may be used to check for asynchronous errors on connected connectionless-mode sockets or for other types of asynchronous errors. SO_ERROR has no default value.

The SO_KEEPALIVE option enables the periodic transmission of messages on a connected socket. The behavior of this option is protocol-specific. The default value for SO_KEEPALIVE is zero, specifying that this capability is turned off.

The SO_LINGER option controls the action of the interface when unsent messages are queued on a socket and a *close*( ) is performed. The details of this option are protocol-specific. The default value for SO_LINGER is zero, or off, for the *l_onoff* element of the option value and zero seconds for the linger time specified by the *l_linger* element.

The SO_OOBINLINE option is valid only on protocols that support out-of-band data. The SO_OOBINLINE option requests that out-of-band data be placed in the normal data input queue as received; it is then accessible using the *read*( ) or *recv*( ) functions without the MSG_OOB flag set. The default for SO_OOBINLINE is off; that is, for out-of-band data not to be placed in the normal data input queue.

The SO_RCVBUF option requests that the buffer space allocated for receive operations on this socket be set to the value, in bytes, of the option value. Applications may wish to increase buffer size for high volume connections, or may decrease buffer size to limit the possible backlog of incoming data. The default value for the SO_RCVBUF option value is implementation-defined, and may vary by protocol.

The maximum value for the option for a socket may be obtained by the use of the *fpathconf*( ) function, using the value _PC_SOCK_MAXBUF.

The SO_RCVLOWAT option sets the minimum number of bytes to process for socket input operations. In general, receive calls block until any (non-zero) amount of data is received, then return the smaller of the amount available or the amount requested. The default value for SO_RCVLOWAT is 1, and does not affect the general case. If SO_RCVLOWAT is set to a larger value, blocking receive calls normally wait until they have received the smaller of the low water mark value or the requested amount. Receive calls may still return less than the low water mark if an error occurs, a signal is caught, or the type of data next in the receive queue is different from that returned (for example, out-of-band data). As mentioned previously, the default value for SO_RCVLOWAT is 1 byte. It is implementation-defined whether the SO_RCVLOWAT option can be set.

The SO_RCVTIMEO option is an option to set a timeout value for input operations. It accepts a **timeval** structure with the number of seconds and microseconds specifying the limit on how long to wait for an input operation to complete. If a receive operation has blocked for this much time without receiving additional data, it shall return with a partial count or *errno* shall be set to [EWOULDBLOCK] if no data were received. The default for this option is the value zero, which indicates that a receive operation will not timeout. It is implementation-defined whether the SO_RCVTIMEO option can be set.

The SO_REUSEADDR option indicates that the rules used in validating addresses supplied in a *bind*( ) should allow reuse of local addresses. Operation of this option is protocol-specific. The default value for SO_REUSEADDR is off; that is, reuse of local addresses is not permitted.

The SO_SNDBUF option requests that the buffer space allocated for send operations on this socket be set to the value, in bytes, of the option value. The default value for the SO_SNDBUF option value is implementation-defined, and may vary by protocol. The maximum value for the option for a socket may be obtained by the use of the *fpathconf*( ) function, using the value _PC_SOCK_MAXBUF.

The SO_SNDLOWAT option sets the minimum number of bytes to process for socket output operations. Most output operations process all of the data supplied by the call, delivering data to the protocol for transmission and blocking as necessary for flow control. Non-blocking output operations process as much data as permitted subject to flow control without blocking, but process no data if flow control does not allow the smaller of the send low water mark value or the entire request to be processed. A *select*( ) operation testing the ability to write to a socket shall return true only if the send low water mark could be processed. The default value for SO_SNDLOWAT is implementation-defined and protocol-specific. It is implementation-defined whether the SO_SNDLOWAT option can be set.

The SO_SNDTIMEO option is an option to set a timeout value for the amount of time that an output function shall block because flow control prevents data from being sent. As noted in Table 2-2 (on page 514), the option value is a **timeval** structure with the number of seconds and microseconds specifying the limit on how long to wait for an output operation to complete. If a send operation has blocked for this much time, it shall return with a partial count or *errno* set to [EWOULDBLOCK] if no data were sent. The default for this option is the value zero, which indicates that a send operation will not timeout. It is implementation-defined whether the SO_SNDTIMEO option can be set.

The SO_TYPE option is used only on *getsockopt*( ). When this option is specified, *getsockopt*( ) shall return the type of the socket (for example, SOCK_STREAM). This option is useful to servers that inherit sockets on start-up. SO_TYPE has no default value.

2.10.17 Use of Sockets for Local UNIX Connections

Support for UNIX domain sockets is mandatory.

UNIX domain sockets provide process-to-process communication in a single system.

2.10.17.1 Headers

The symbolic constant AF_UNIX defined in the **<sys/socket.h>** header is used to identify the UNIX domain address family. The **<sys/un.h>** header contains other definitions used in connection with UNIX domain sockets. See the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 13, Headers.

The **sockaddr_storage** structure defined in **<sys/socket.h>** shall be large enough to accommodate a **sockaddr_un** structure (see the **<sys/un.h>** header defined in the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 13, Headers) and shall be aligned at an appropriate boundary so that pointers to it can be cast as pointers to **sockaddr_un** structures and used to access the fields of those structures without alignment problems. When a **sockaddr_storage** structure is cast as a **sockaddr_un** structure, the *ss_family* field maps onto the *sun_family* field.

2.10.18 Use of Sockets over Internet Protocols

When a socket is created in the Internet family with a protocol value of zero, the implementation shall use the protocol listed below for the type of socket created.

	SOCK_STREAM	IPPROTO_TCP.
	SOCK_DGRAM	IPPROTO_UDP.
RS	SOCK_RAW	IPPROTO_RAW.
	SOCK_SEQPACKET	Unspecified.

RS A raw interface to IP is available by creating an Internet socket of type SOCK_RAW. The default protocol for type SOCK_RAW shall be identified in the IP header with the value IPPROTO_RAW. Applications should not use the default protocol when creating a socket with type SOCK_RAW, but should identify a specific protocol by value. The ICMP control protocol is accessible from a raw socket by specifying a value of IPPROTO_ICMP for protocol.

2.10.19 Use of Sockets over Internet Protocols Based on IPv4

Support for sockets over Internet protocols based on IPv4 is mandatory.

2.10.19.1 Headers

The symbolic constant AF_INET defined in the **<sys/socket.h>** header is used to identify the IPv4 Internet address family. The **<netinet/in.h>** header contains other definitions used in connection with IPv4 Internet sockets. See the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 13, Headers.

The **sockaddr_storage** structure defined in **<sys/socket.h>** shall be large enough to accommodate a **sockaddr_in** structure (see the **<netinet/in.h>** header defined in the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 13, Headers) and shall be aligned at an appropriate boundary so that pointers to it can be cast as pointers to **sockaddr_in** structures and used to access the fields of those structures without alignment problems. When a **sockaddr_storage** structure is cast as a **sockaddr_in** structure, the *ss_family* field maps onto the *sin_family* field.

2.10.20 Use of Sockets over Internet Protocols Based on IPv6

IP6 This section describes extensions to support sockets over Internet protocols based on IPv6. This functionality is dependent on support of the IPV6 option (and the rest of this section is not further shaded for this option).

To enable smooth transition from IPv4 to IPv6, the features defined in this section may, in certain circumstances, also be used in connection with IPv4; see Section 2.10.20.2 (on page 518).

2.10.20.1 Addressing

IPv6 overcomes the addressing limitations of previous versions by using 128-bit addresses instead of 32-bit addresses. The IPv6 address architecture is described in RFC 2373.

There are three kinds of IPv6 address:

Unicast

Identifies a single interface.

A unicast address can be global, link-local (designed for use on a single link), or site-local (designed for systems not connected to the Internet). Link-local and site-local addresses need not be globally unique.

Anycast

Identifies a set of interfaces such that a packet sent to the address can be delivered to any member of the set.

An anycast address is similar to a unicast address; the nodes to which an anycast address is assigned must be explicitly configured to know that it is an anycast address.

Multicast

Identifies a set of interfaces such that a packet sent to the address should be delivered to every member of the set.

An application can send multicast datagrams by simply specifying an IPv6 multicast address in the *address* argument of *sendto*( ). To receive multicast datagrams, an application must join the multicast group (using *setsockopt*( ) with IPV6_JOIN_GROUP) and must bind to the socket the UDP port on which datagrams will be received. Some applications should also bind the multicast group address to the socket, to prevent other datagrams destined to that port from being delivered to the socket.

A multicast address can be global, node-local, link-local, site-local, or organization-local.

The following special IPv6 addresses are defined:

Unspecified
An address that is not assigned to any interface and is used to indicate the absence of an address.

Loopback
A unicast address that is not assigned to any interface and can be used by a node to send packets to itself.

Two sets of IPv6 addresses are defined to correspond to IPv4 addresses:

IPv4-compatible addresses
These are assigned to nodes that support IPv6 and can be used when traffic is ‘‘tunneled’’ through IPv4.

IPv4-mapped addresses
These are used to represent IPv4 addresses in IPv6 address format; see Section 2.10.20.2.

Note that the unspecified address and the loopback address must not be treated as IPv4-compatible addresses.

2.10.20.2 Compatibility with IPv4

The API provides the ability for IPv6 applications to interoperate with applications using IPv4, by using IPv4-mapped IPv6 addresses. These addresses can be generated automatically by the *getaddrinfo*( ) function when the specified host has only IPv4 addresses.

Applications may use AF_INET6 sockets to open TCP connections to IPv4 nodes, or send UDP packets to IPv4 nodes, by simply encoding the destination’s IPv4 address as an IPv4-mapped IPv6 address, and passing that address, within a **sockaddr_in6** structure, in the *connect*( ), *sendto*( ) or *sendmsg*( ) function. When applications use AF_INET6 sockets to accept TCP connections from IPv4 nodes, or receive UDP packets from IPv4 nodes, the system shall return the peer’s address to the application in the *accept*( ), *recvfrom*( ), *recvmsg*( ), or *getpeername*( ) function using a **sockaddr_in6** structure encoded this way. If a node has an IPv4 address, then the implementation may allow applications to communicate using that address via an AF_INET6 socket. In such a case, the address will be represented at the API by the corresponding IPv4-mapped IPv6 address. Also, the implementation may allow an AF_INET6 socket bound to **in6addr_any** to receive inbound connections and packets destined to one of the node’s IPv4 addresses.

An application may use AF_INET6 sockets to bind to a node’s IPv4 address by specifying the address as an IPv4-mapped IPv6 address in a **sockaddr_in6** structure in the *bind*( ) function. For an AF_INET6 socket bound to a node’s IPv4 address, the system shall return the address in the *getsockname*( ) function as an IPv4-mapped IPv6 address in a **sockaddr_in6** structure.

2.10.20.3 Interface Identification

Each local interface is assigned a unique positive integer as a numeric index. Indexes start at 1; zero is not used. There may be gaps so that there is no current interface for a particular positive index. Each interface also has a unique implementation-defined name.

2.10.20.4 Options

The following options apply at the IPPROTO_IPV6 level:

IPV6_JOIN_GROUP

When set via *setsockopt*( ), it joins the application to a multicast group on an interface (identified by its index) and addressed by a given multicast address, enabling packets sent to that address to be read via the socket. If the interface index is specified as zero, the system selects the interface (for example, by looking up the address in a routing table and using the resulting interface).

An attempt to read this option using *getsockopt*( ) shall result in an [EOPNOTSUPP] error.

The value of this option is an **ipv6_mreq** structure.

IPV6_LEAVE_GROUP

When set via *setsockopt*( ), it removes the application from the multicast group on an interface (identified by its index) and addressed by a given multicast address.

An attempt to read this option using *getsockopt*( ) shall result in an [EOPNOTSUPP] error.

The value of this option is an **ipv6_mreq** structure.

IPV6_MULTICAST_HOPS

The value of this option is the hop limit for outgoing multicast IPv6 packets sent via the socket. Its possible values are the same as those of IPV6_UNICAST_HOPS. If the IPV6_MULTICAST_HOPS option is not set, a value of 1 is assumed. This option can be set via *setsockopt*( ) and read via *getsockopt*( ).

IPV6_MULTICAST_IF

The index of the interface to be used for outgoing multicast packets. It can be set via *setsockopt*( ) and read via *getsockopt*( ).

IPV6_MULTICAST_LOOP

This option controls whether outgoing multicast packets should be delivered back to the local application when the sending interface is itself a member of the destination multicast group. If it is set to 1 they are delivered. If it is set to 0 they are not. Other values result in an [EINVAL] error. This option can be set via *setsockopt*( ) and read via *getsockopt*( ).

IPV6_UNICAST_HOPS

The value of this option is the hop limit for outgoing unicast IPv6 packets sent via the socket. If the option is not set, or is set to −1, the system selects a default value. Attempts to set a value less than −1 or greater than 255 shall result in an [EINVAL] error. This option can be set via *setsockopt*( ) and read via *getsockopt*( ). |

IPV6_V6ONLY |

This socket option restricts AF_INET6 sockets to IPv6 communications only. AF_INET6 sockets may be used for both IPv4 and IPv6 communications. Some applications may want to restrict their use of an AF_INET6 socket to IPv6 communications only. For these applications, the IPv6_V6ONLY socket option is defined. When this option is turned on, the socket can be used to send and receive IPv6 packets only. This is an IPPROTO_IPV6-level option. This option takes an **int** value. This is a Boolean option. By default, this option is turned off. |

An [EOPNOTSUPP] error shall result if IPV6_JOIN_GROUP or IPV6_LEAVE_GROUP is used with *getsockopt*( ).

2.10.20.5 Headers

The symbolic constant AF_INET6 is defined in the **<sys/socket.h>** header to identify the IPv6 Internet address family. See the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 13, Headers.

The **sockaddr_storage** structure defined in **<sys/socket.h>** shall be large enough to accommodate a **sockaddr_in6** structure (see the **<netinet/in.h>** header defined in the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 13, Headers) and shall be aligned at an appropriate boundary so that pointers to it can be cast as pointers to **sockaddr_in6** structures and used to access the fields of those structures without alignment problems. When a **sockaddr_storage** structure is cast as a **sockaddr_in6** structure, the *ss_family* field maps onto the *sin6_family* field.

The **<netinet/in.h>**, **<arpa/inet.h>**, and **<netdb.h>** headers contain other definitions used in connection with IPv6 Internet sockets; see the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 13, Headers.

2.11 Tracing

TRC This section describes extensions to support tracing of user applications. This functionality is dependent on support of the Trace option (and the rest of this section is not further shaded for this option).

The tracing facilities defined in IEEE Std 1003.1-200x allow a process to select a set of trace event types, to activate a trace stream of the selected trace events as they occur in the flow of execution, and to retrieve the recorded trace events.

The tracing operation relies on three logically different components: the traced process, the controller process, and the analyzer process. During the execution of the traced process, when a trace point is reached, a trace event is recorded into the trace streams created for that process in which the associated trace event type identifier is not being filtered out. The controller process controls the operation of recording the trace events into the trace stream. It shall be able to:

- Initialize the attributes of a trace stream
- Create the trace stream (for a specified traced process) using those attributes
- Start and stop tracing for the trace stream
- Filter the type of trace events to be recorded, if the Trace Event Filter option is supported
- Shut a trace stream down

These operations can be done for an active trace stream. The analyzer process retrieves the traced events either at runtime, when the trace stream has not yet been shut down, but is still recording trace events; or after opening a trace log that had been previously recorded and shut down. These three logically different operations can be performed by the same process, or can be distributed into different processes.

A trace stream identifier can be created by a call to *posix_trace_create*( ), *posix_trace_create_withlog*( ), or *posix_trace_open*( ). The *posix_trace_create*( ) and *posix_trace_create_withlog*( ) functions should be used by a controller process. The *posix_trace_open*( ) should be used by an analyzer process.

The tracing functions can serve different purposes. One purpose is debugging the possibly pre-instrumented code, while another is post-mortem fault analysis. These two potential uses differ in that the first requires pre-filtering capabilities to avoid overwhelming the trace stream and permits focusing on expected information; while the second needs comprehensive trace capabilities in order to be able to record all types of information.

The events to be traced belong to two classes:

1. User trace events (generated by the application instrumentation)
2. System trace events (generated by the operating system)

The trace interface defines several system trace event types associated with control of and operation of the trace stream. This small set of system trace events includes the minimum required to interpret correctly the trace event information present in the stream. Other desirable system trace events for some particular application profile may be implemented and are encouraged; for example, process and thread scheduling, signal occurrence, and so on.

Each traced process shall have a mapping of the trace event names to trace event type identifiers that have been defined for that process. Each active trace stream shall have a mapping that incorporates all the trace event type identifiers predefined by the trace system plus all the mappings of trace event names to trace event type identifiers of the processes that are being traced into that trace stream. These mappings are defined from the instrumented application by calling the *posix_trace_eventid_open*( ) function and from the controller process by calling the *posix_trace_trid_eventid_open*( ) function. For a pre-recorded trace stream, the list of trace event types is obtained from the pre-recorded trace log.

The *st_ctime* and *st_mtime* fields of a file associated with an active trace stream shall be marked for update every time any of the tracing operations modifies that file.

The *st_atime* field of a file associated with a trace stream shall be marked for update every time any of the tracing operations causes data to be read from that file.

Results are undefined if the application performs any operation on a file descriptor associated with an active or pre-recorded trace stream until *posix_trace_shutdown*( ) or *posix_trace_close*( ) is called for that trace stream.

The main purpose of this option is to define a complete set of functions and concepts that allow a conforming application to be traced from creation to termination, whatever its realtime constraints and properties.

2.11.1 Tracing Data Definitions

2.11.1.1 Structures

The **<trace.h>** header shall define the *posix_trace_status_info* and *posix_trace_event_info* structures described below. Implementations may add extensions to these structures.

posix_trace_status_info Structure

To facilitate control of a trace stream, information about the current state of an active trace stream can be obtained dynamically. This structure is returned by a call to the *posix_trace_get_status*( ) function.

The **posix_trace_status_info** structure defined in **<trace.h>** shall contain at least the following members:

Member Type	Member Name	Description
int	*posix_stream_status*	The operating mode of the trace stream.
int	*posix_stream_full_status*	The full status of the trace stream.
int	*posix_stream_overrun_status*	Indicates whether trace events were lost in the trace stream.

If the Trace Log option is supported in addition to the Trace option, the **posix_trace_status_info** structure defined in **<trace.h>** shall contain at least the following additional members:

Member Type	Member Name	Description
int	*posix_stream_flush_status*	Indicates whether a flush is in progress.
int	*posix_stream_flush_error*	Indicates whether any error occurred during the last flush operation.
int	*posix_log_overrun_status*	Indicates whether trace events were lost in the trace log.
int	*posix_log_full_status*	The full status of the trace log.

The *posix_stream_status* member indicates the operating mode of the trace stream and shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_RUNNING
Tracing is in progress; that is, the trace stream is accepting trace events.

POSIX_TRACE_SUSPENDED
The trace stream is not accepting trace events. The tracing operation has not yet started or has stopped, either following a *posix_trace_stop*( ) function call or because the trace resources are exhausted.

The *posix_stream_full_status* member indicates the full status of the trace stream, and it shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_FULL
The space in the trace stream for trace events is exhausted.

POSIX_TRACE_NOT_FULL
There is still space available in the trace stream.

The combination of the *posix_stream_status* and *posix_stream_full_status* members also indicates the actual status of the stream. The status shall be interpreted as follows:

POSIX_TRACE_RUNNING and POSIX_TRACE_NOT_FULL
This status combination indicates that tracing is in progress, and there is space available for recording more trace events.

POSIX_TRACE_RUNNING and POSIX_TRACE_FULL
This status combination indicates that tracing is in progress and that the trace stream is full of trace events. This status combination cannot occur unless the *stream-full-policy* is set to POSIX_TRACE_LOOP. The trace stream contains trace events recorded during a moving time window of prior trace events, and some older trace events may have been overwritten and thus lost.

POSIX_TRACE_SUSPENDED and POSIX_TRACE_NOT_FULL
This status combination indicates that tracing has not yet been started, has been stopped by the *posix_trace_stop*( ) function, or has been cleared by the *posix_trace_clear*( ) function.

POSIX_TRACE_SUSPENDED and POSIX_TRACE_FULL

This status combination indicates that tracing has been stopped by the implementation because the *stream-full-policy* attribute was POSIX_TRACE_UNTIL_FULL and trace resources were exhausted, or that the trace stream was stopped by the function *posix_trace_stop*( ) at a time when trace resources were exhausted.

The *posix_stream_overrun_status* member indicates whether trace events were lost in the trace stream, and shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_OVERRUN

At least one trace event was lost and thus was not recorded in the trace stream.

POSIX_TRACE_NO_OVERRUN

No trace events were lost.

When the corresponding trace stream is created, the *posix_stream_overrun_status* member shall be set to POSIX_TRACE_NO_OVERRUN.

Whenever an overrun occurs, *posix_stream_overrun_status* member shall be set to POSIX_TRACE_OVERRUN.

An overrun occurs when:

- The policy is POSIX_TRACE_LOOP and a recorded trace event is overwritten.
- The policy is POSIX_TRACE_UNTIL_FULL and the trace stream is full when a trace event is generated.
- If the Trace Log option is supported, the policy is POSIX_TRACE_FLUSH and at least one trace event is lost while flushing the trace stream to the trace log.

The *posix_stream_overrun_status* member is reset to zero after its value is read.

If the Trace Log option is supported in addition to the Trace option, the *posix_stream_flush_status*, *posix_stream_flush_error*, *posix_log_overrun_status*, and *posix_log_full_status* members are defined as follows; otherwise, they are undefined.

The *posix_stream_flush_status* member indicates whether a flush operation is being performed and shall have one of the following values defined by manifest constants in the header **<trace.h>**:

POSIX_TRACE_FLUSHING

The trace stream is currently being flushed to the trace log.

POSIX_TRACE_NOT_FLUSHING

No flush operation is in progress.

The *posix_stream_flush_status* member shall be set to POSIX_TRACE_FLUSHING if a flush operation is in progress either due to a call to the *posix_trace_flush*( ) function (explicit or caused by a trace stream shutdown operation) or because the trace stream has become full with the *stream-full-policy* attribute set to POSIX_TRACE_FLUSH. The *posix_stream_flush_status* member shall be set to POSIX_TRACE_NOT_FLUSHING if no flush operation is in progress.

The *posix_stream_flush_error* member shall be set to zero if no error occurred during flushing. If an error occurred during a previous flushing operation, the *posix_stream_flush_error* member shall be set to the value of the first error that occurred. If more than one error occurs while flushing, error values after the first shall be discarded. The *posix_stream_flush_error* member is reset to zero after its value is read.

The *posix_log_overrun_status* member indicates whether trace events were lost in the trace log, and shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_OVERRUN
At least one trace event was lost.

POSIX_TRACE_NO_OVERRUN
No trace events were lost.

When the corresponding trace stream is created, the *posix_log_overrun_status* member shall be set to POSIX_TRACE_NO_OVERRUN. Whenever an overrun occurs, this status shall be set to POSIX_TRACE_OVERRUN. The *posix_log_overrun_status* member is reset to zero after its value is read.

The *posix_log_full_status* member indicates the full status of the trace log, and it shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_FULL
The space in the trace log is exhausted.

POSIX_TRACE_NOT_FULL
There is still space available in the trace log.

The *posix_log_full_status* member is only meaningful if the *log-full-policy* attribute is either POSIX_TRACE_UNTIL_FULL or POSIX_TRACE_LOOP.

For an active trace stream without log, that is created by the *posix_trace_create*( ) function, the *posix_log_overrun_status* member shall be set to POSIX_TRACE_NO_OVERRUN and the *posix_log_full_status* member shall be set to POSIX_TRACE_NOT_FULL.

posix_trace_event_info Structure

The trace event structure **posix_trace_event_info** contains the information for one recorded trace event. This structure is returned by the set of functions *posix_trace_getnext_event*( ), *posix_trace_timedgetnext_event*( ), and *posix_trace_trygetnext_event*( ).

The **posix_trace_event_info** structure defined in **<trace.h>** shall contain at least the following members:

Member Type	Member Name	Description
trace_event_id_t	*posix_event_id*	Trace event type identification.
pid_t	*posix_pid*	Process ID of the process that generated the trace event.
void *	*posix_prog_address*	Address at which the trace point was invoked.
int	*posix_truncation_status*	Status about the truncation of the data associated with this trace event.
struct timespec	*posix_timestamp*	Time at which the trace event was generated.

In addition, if the Trace option and the Threads option are both supported, the **posix_trace_event_info** structure defined in **<trace.h>** shall contain the following additional member:

Member Type	Member Name	Description
pthread_t	*posix_thread_id*	Thread ID of the thread that generated the trace event.

The *posix_event_id* member represents the identification of the trace event type and its value is not directly defined by the user. This identification is returned by a call to one of the following functions: *posix_trace_trid_eventid_open*( ), *posix_trace_eventtypelist_getnext_id*( ), or *posix_trace_eventid_open*( ). The name of the trace event type can be obtained by calling *posix_trace_eventid_get_name*( ).

The *posix_pid* is the process identifier of the traced process which generated the trace event. If the *posix_event_id* member is one of the implementation-defined system trace events and that trace event is not associated with any process, the *posix_pid* member shall be set to zero.

For a user trace event, the *posix_prog_address* member is the process mapped address of the point at which the associated call to the *posix_trace_event*( ) function was made. For a system trace event, if the trace event is caused by a system service explicitly called by the application, the *posix_prog_address* member shall be the address of the process at the point where the call to that system service was made.

The *posix_truncation_status* member defines whether the data associated with a trace event has been truncated at the time the trace event was generated, or at the time the trace event was read from the trace stream, or (if the Trace Log option is supported) from the trace log (see the *event* argument from the *posix_trace_getnext_event*( ) function). The *posix_truncation_status* member shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_NOT_TRUNCATED
All the traced data is available.

POSIX_TRACE_TRUNCATED_RECORD
Data was truncated at the time the trace event was generated.

POSIX_TRACE_TRUNCATED_READ
Data was truncated at the time the trace event was read from a trace stream or a trace log because the reader's buffer was too small. This truncation status overrides the POSIX_TRACE_TRUNCATED_RECORD status.

The *posix_timestamp* member shall be the time at which the trace event was generated. The clock used is implementation-defined, but the resolution of this clock can be retrieved by a call to the *posix_trace_attr_getclockres*( ) function.

If the Threads option is supported in addition to the Trace option:

- The *posix_thread_id* member is the identifier of the thread that generated the trace event. If the *posix_event_id* member is one of the implementation-defined system trace events and that trace event is not associated with any thread, the *posix_thread_id* member shall be set to zero.

Otherwise, this member is undefined.

2.11.1.2 Trace Stream Attributes

Trace streams have attributes that compose the **posix_trace_attr_t** trace stream attributes object. This object shall contain at least the following attributes:

- The *generation-version* attribute identifies the origin and version of the trace system.

- The *trace-name* attribute is a character string defined by the trace controller, and that identifies the trace stream.
- The *creation-time* attribute represents the time of the creation of the trace stream.
- The *clock-resolution* attribute defines the clock resolution of the clock used to generate timestamps.
- The *stream-min-size* attribute defines the minimum size in bytes of the trace stream strictly reserved for the trace events.
- The *stream-full-policy* attribute defines the policy followed when the trace stream is full; its value is POSIX_TRACE_LOOP, POSIX_TRACE_UNTIL_FULL, or POSIX_TRACE_FLUSH.
- The *max-data-size* attribute defines the maximum record size in bytes of a trace event.

In addition, if the Trace option and the Trace Inherit option are both supported, the **posix_trace_attr_t** trace stream creation attributes object shall contain at least the following attributes:

- The *inheritance* attribute specifies whether a newly created trace stream will inherit tracing in its parent's process trace stream. It is either POSIX_TRACE_INHERITED or POSIX_TRACE_CLOSE_FOR_CHILD.

In addition, if the Trace option and the Trace Log option are both supported, the **posix_trace_attr_t** trace stream creation attributes object shall contain at least the following attribute:

- If the file type corresponding to the trace log supports the POSIX_TRACE_LOOP or the POSIX_TRACE_UNTIL_FULL policies, the *log-max-size* attribute defines the maximum size in bytes of the trace log associated with an active trace stream. Other stream data—for example, trace attribute values—shall not be included in this size.
- The *log-full-policy* attribute defines the policy of a trace log associated with an active trace stream to be POSIX_TRACE_LOOP, POSIX_TRACE_UNTIL_FULL, or POSIX_TRACE_APPEND.

2.11.2 Trace Event Type Definitions

2.11.2.1 System Trace Event Type Definitions

The following system trace event types, defined in the **<trace.h>** header, track the invocation of the trace operations:

- POSIX_TRACE_START shall be associated with a trace start operation.
- POSIX_TRACE_STOP shall be associated with a trace stop operation.
- if the Trace Event Filter option is supported, POSIX_TRACE_FILTER shall be associated with a trace event type filter change operation.

The following system trace event types, defined in the **<trace.h>** header, report operational trace events:

- POSIX_TRACE_OVERFLOW shall mark the beginning of a trace overflow condition.
- POSIX_TRACE_RESUME shall mark the end of a trace overflow condition.
- If the Trace Log option is supported, POSIX_TRACE_FLUSH_START shall mark the beginning of a flush operation.

- If the Trace Log option is supported, POSIX_TRACE_FLUSH_STOP shall mark the end of a flush operation.
- If an implementation-defined trace error condition is reported, it shall be marked POSIX_TRACE_ERROR.

The interpretation of a trace stream or a trace log by a trace analyzer process relies on the information recorded for each trace event, and also on system trace events that indicate the invocation of trace control operations and trace system operational trace events.

The POSIX_TRACE_START and POSIX_TRACE_STOP trace events specify the time windows during which the trace stream is running.

> The POSIX_TRACE_STOP trace event with an associated data that is equal to zero indicates a call of the function *posix_trace_stop*( ).
>
> The POSIX_TRACE_STOP trace event with an associated data that is different from zero indicates an automatic stop of the trace stream (see *posix_trace_attr_getstreamfullpolicy*( ) defined in the System Interfaces volume of IEEE Std 1003.1-200x).

The POSIX_TRACE_FILTER trace event indicates that a trace event type filter value changed while the trace stream was running.

The POSIX_TRACE_ERROR serves to inform the analyzer process that an implementation-defined internal error of the trace system occurred.

The POSIX_TRACE_OVERFLOW trace event shall be reported with a timestamp equal to the timestamp of the first trace event overwritten. This is an indication that some generated trace events have been lost.

The POSIX_TRACE_RESUME trace event shall be reported with a timestamp equal to the timestamp of the first valid trace event reported after the overflow condition ends and shall be reported before this first valid trace event. This is an indication that the trace system is reliably recording trace events after an overflow condition.

Each of these trace event types shall be defined by a constant trace event name and a **trace_event_id_t** constant; trace event data is associated with some of these trace events.

If the Trace option is supported and the Trace Event Filter option and the Trace Log option are not supported, the following predefined system trace events in Table 2-3 shall be defined:

Table 2-3 Trace Option: System Trace Events

Event Name	Constant	Associated Data Data Type
posix_trace_error	POSIX_TRACE_ERROR	error int
posix_trace_start	POSIX_TRACE_START	None.
posix_trace_stop	POSIX_TRACE_STOP	auto int
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.

If the Trace option and the Trace Event Filter option are both supported, and if the Trace Log option is not supported, the following predefined system trace events in Table 2-4 (on page 528) shall be defined:

Table 2-4 Trace and Trace Event Filter Options: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error
		int
posix_trace_start	POSIX_TRACE_START	event_filter
		trace_event_set_t
posix_trace_stop	POSIX_TRACE_STOP	auto
		int
posix_trace_filter	POSIX_TRACE_FILTER	old_event_filter new_event_filter
		trace_event_set_t
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.

If the Trace option and the Trace Log option are both supported, and if the Trace Event Filter option is not supported, the following predefined system trace events in Table 2-5 shall be defined:

Table 2-5 Trace and Trace Log Options: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error - int
posix_trace_start	POSIX_TRACE_START	None.
posix_trace_stop	POSIX_TRACE_STOP	auto
		int
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.
posix_trace_flush_start	POSIX_TRACE_FLUSH_START	None.
posix_trace_flush_stop	POSIX_TRACE_FLUSH_STOP	None.

If the Trace option, the Trace Event Filter option, and the Trace Log option are all supported, the following predefined system trace events in Table 2-6 (on page 529) shall be defined:

Table 2-6 Trace, Trace Log, and Trace Event Filter Options: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error
		int
posix_trace_start	POSIX_TRACE_START	event_filter
		trace_event_set_t
posix_trace_stop	POSIX_TRACE_STOP	auto
		int
posix_trace_filter	POSIX_TRACE_FILTER	old_event_filter new_event_filter
		trace_event_set_t
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.
posix_trace_flush_start	POSIX_TRACE_FLUSH_START	None.
posix_trace_flush_stop	POSIX_TRACE_FLUSH_STOP	None.

2.11.2.2 *User Trace Event Type Definitions*

The user trace event POSIX_TRACE_UNNAMED_USEREVENT is defined in the **<trace.h>** header. If the limit of per-process user trace event names represented by {TRACE_USER_EVENT_MAX} has already been reached, this predefined user event shall be returned when the application tries to register more events than allowed. The data associated with this trace event is application-defined.

The following predefined user trace event in Table 2-7 shall be defined:

Table 2-7 Trace Option: User Trace Event

Event Name	Constant
posix_trace_unnamed_userevent	POSIX_TRACE_UNNAMED_USEREVENT

2.11.3 Trace Functions

The trace interface is built and structured to improve portability through use of trace data of opaque type. The object-oriented approach for the manipulation of trace attributes and trace event type identifiers requires definition of many constructor and selector functions which operate on these opaque types. Also, the trace interface must support several different tracing roles. To facilitate reading the trace interface, the trace functions are grouped into small functional sets supporting the three different roles:

- A trace controller process requires functions to set up and customize all the resources needed to run a trace stream, including:
  - — Attribute initialization and destruction (*posix_trace_attr_init*( ))
  - — Identification information manipulation (*posix_trace_attr_getgenversion*( ))
  - — Trace system behavior modification (*posix_trace_attr_getinherited*( ))
  - — Trace stream and trace log size set (*posix_trace_attr_getmaxusereventsize*( ))

  - Trace stream creation, flush, and shutdown (*posix_trace_create*( ))
  - Trace stream and trace log clear (*posix_trace_clear*( ))
  - Trace event type identifier manipulation (*posix_trace_trid_eventid_open*( ))
  - Trace event type identifier list exploration (*posix_trace_eventtypelist_getnext_id*( ))
  - Trace event type set manipulation (*posix_trace_eventset_empty*( ))
  - Trace event type filter set (*posix_trace_set_filter*( ))
  - Trace stream start and stop (*posix_trace_start*( ))
  - Trace stream information and status read (*posix_trace_get_attr*( ))
- A traced process requires functions to instrument trace points:
  - Trace event type identifiers definition and trace points insertion (*posix_trace_event*( ))
- A trace analyzer process requires functions to retrieve information from a trace stream and trace log:
  - Identification information read (*posix_trace_attr_getgenversion*( ))
  - Trace system behavior information read (*posix_trace_attr_getinherited*( ))
  - Trace stream and trace log size get (*posix_trace_attr_getmaxusereventsize*( ))
  - Trace event type identifier manipulation (*posix_trace_trid_eventid_open*( ))
  - Trace event type identifier list exploration (*posix_trace_eventtypelist_getnext_id*( ))
  - Trace log open, rewind, and close (*posix_trace_open*( ))
  - Trace stream information and status read (*posix_trace_get_attr*( ))
  - trace event read (*posix_trace_getnext_event*( ))

2.12 Data Types

All of the data types used by various functions are defined by the implementation. The following table describes some of these types. Other types referenced in the description of a function, not mentioned here, can be found in the appropriate header for that function.

Defined Type	Description
cc_t	Type used for terminal special characters.
clock_t	Arithmetic type used for processor times, as defined in the ISO C standard.
clockid_t	Used for clock ID type in some timer functions.
dev_t	Arithmetic type used for device numbers.
DIR	Type representing a directory stream.
div_t	Structure type returned by the *div*( ) function.
FILE	Structure containing information about a file.
glob_t	Structure type used in pathname pattern matching.
fpos_t	Type containing all information needed to specify uniquely every

Defined Type	Description
	position within a file.
gid_t	Arithmetic type used for group IDs.
iconv_t	Type used for conversion descriptors.
id_t	Arithmetic type used as a general identifier; can be used to contain at least the largest of a **pid_t**, **uid_t**, or **gid_t**.
ino_t	Arithmetic type used for file serial numbers.
key_t	Arithmetic type used for XSI interprocess communication.
ldiv_t	Structure type returned by the *ldiv*( ) function.
mode_t	Arithmetic type used for file attributes.
mqd_t	Used for message queue descriptors.
nfds_t	Integer type used for the number of file descriptors.
nlink_t	Arithmetic type used for link counts.
off_t	Signed arithmetic type used for file sizes.
pid_t	Signed arithmetic type used for process and process group IDs.
pthread_attr_t	Used to identify a thread attribute object.
pthread_cond_t	Used for condition variables.
pthread_condattr_t	Used to identify a condition attribute object.
pthread_key_t	Used for thread-specific data keys.
pthread_mutex_t	Used for mutexes.
pthread_mutexattr_t	Used to identify a mutex attribute object.
pthread_once_t	Used for dynamic package initialization.
pthread_rwlock_t	Used for read-write locks.
pthread_rwlockattr_t	Used for read-write lock attributes.
pthread_t	Used to identify a thread.
ptrdiff_t	Signed integer type of the result of subtracting two pointers.
regex_t	Structure type used in regular expression matching.
regmatch_t	Structure type used in regular expression matching.
rlim_t	Unsigned arithmetic type used for limit values, to which objects of type **int** and **off_t** can be cast without loss of value.
sem_t	Type used in performing semaphore operations.
sig_atomic_t	Integer type of an object that can be accessed as an atomic entity, even in the presence of asynchronous interrupts.
sigset_t	Integer or structure type of an object used to represent sets of signals.
size_t	Unsigned integer type used for size of objects.
speed_t	Type used for terminal baud rates.
ssize_t	Arithmetic type used for a count of bytes or an error indication.
suseconds_t	Signed arithmetic type used for time in microseconds.
tcflag_t	Type used for terminal modes.
time_t	Arithmetic type used for time in seconds, as defined in the ISO C standard.
timer_t	Used for timer ID returned by the *timer_create*( ) function.
uid_t	Arithmetic type used for user IDs.
useconds_t	Integer type used for time in microseconds.
va_list	Type used for traversing variable argument lists.
wchar_t	Integer type whose range of values can represent distinct codes for all members of the largest extended character set specified by the

Defined Type	Description
	supported locales.
wctype_t	Scalar type which represents a character class descriptor.
wint_t	Integer type capable of storing any valid value of **wchar_t** or WEOF.
wordexp_t	Structure type used in word expansion.

Chapter 3

System Interfaces

This chapter describes the functions, macros, and external variables to support applications portability at the C-language source level.

NAME

FD_CLR — macros for synchronous I/O multiplexing

SYNOPSIS

```
#include <sys/time.h>

FD_CLR(int fd, fd_set *fdset);
FD_ISSET(int fd, fd_set *fdset);
FD_SET(int fd, fd_set *fdset);
FD_ZERO(fd_set *fdset);
```

DESCRIPTION

Refer to *pselect*( ).

NAME

_Exit, _exit — terminate a process

SYNOPSIS

```
#include <unistd.h>

void _Exit(int status);
void _exit(int status);
```

DESCRIPTION

Refer to *exit*( ).

NAME

_longjmp, _setjmp — non-local goto

SYNOPSIS

XSI

```
#include <setjmp.h>

void _longjmp(jmp_buf env, int val);
int _setjmp(jmp_buf env);
```

DESCRIPTION

The *_longjmp*( ) and *_setjmp*( ) functions shall be equivalent to *longjmp*( ) and *setjmp*( ), respectively, with the additional restriction that *_longjmp*( ) and *_setjmp*( ) shall not manipulate the signal mask. |

If *_longjmp*( ) is called even though *env* was never initialized by a call to *_setjmp*( ), or when the last such call was in a function that has since returned, the results are undefined.

RETURN VALUE

Refer to *longjmp*( ) and *setjmp*( ).

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

If *_longjmp*( ) is executed and the environment in which *_setjmp*( ) was executed no longer exists, errors can occur. The conditions under which the environment of the *_setjmp*( ) no longer exists include exiting the function that contains the *_setjmp*( ) call, and exiting an inner block with temporary storage. This condition might not be detectable, in which case the *_longjmp*( ) occurs and, if the environment no longer exists, the contents of the temporary storage of an inner block are unpredictable. This condition might also cause unexpected process termination. If the function has returned, the results are undefined.

Passing *longjmp*( ) a pointer to a buffer not created by *setjmp*( ), passing *_longjmp*( ) a pointer to a buffer not created by *_setjmp*( ), passing *siglongjmp*( ) a pointer to a buffer not created by *sigsetjmp*( ), or passing any of these three functions a buffer that has been modified by the user can cause all the problems listed above, and more.

The *_longjmp*( ) and *_setjmp*( ) functions are included to support programs written to historical system interfaces. New applications should use *siglongjmp*( ) and *sigsetjmp*( ) respectively.

RATIONALE

None.

FUTURE DIRECTIONS

The *_longjmp*( ) and *_setjmp*( ) functions may be marked LEGACY in a future version.

NAME

_setjmp — set jump point for a non-local goto

SYNOPSIS

XSI

```
#include <setjmp.h>

int _setjmp(jmp_buf env);
```

DESCRIPTION

Refer to *_longjmp*( ).

NAME

_tolower — transliterate uppercase characters to lowercase

SYNOPSIS

XSI
```
#include <ctype.h>

int _tolower(int c);
```

DESCRIPTION

The *_tolower*( ) macro shall be equivalent to *tolower*(*c*) except that the application shall ensure that the argument *c* is an uppercase letter.

RETURN VALUE

Upon successful completion, *_tolower*( ) shall return the lowercase letter corresponding to the argument passed.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

NAME

a64l, l64a — convert between a 32-bit integer and a radix-64 ASCII string

SYNOPSIS

XSI

```
#include <stdlib.h>

long a64l(const char *s);
char *l64a(long value);
```

DESCRIPTION

These functions maintain numbers stored in radix-64 ASCII characters. This is a notation by which 32-bit integers can be represented by up to six characters; each character represents a digit in radix-64 notation. If the type **long** contains more than 32 bits, only the low-order 32 bits shall be used for these operations.

The characters used to represent digits are `'.'` (dot) for 0, `'/'` for 1, `'0'` through `'9'` for [2,11], `'A'` through `'Z'` for [12,37], and `'a'` through `'z'` for [38,63].

The *a64l*( ) function shall take a pointer to a radix-64 representation, in which the first digit is the least significant, and return the corresponding **long** value. If the string pointed to by *s* contains more than six characters, *a64l*( ) shall use the first six. If the first six characters of the string contain a null terminator, *a64l*( ) shall use only characters preceding the null terminator. The *a64l*( ) function shall scan the character string from left to right with the least significant digit on the left, decoding each character as a 6-bit radix-64 number. If the type **long** contains more than 32 bits, the resulting value is sign-extended. The behavior of *a64l*( ) is unspecified if *s* is a null pointer or the string pointed to by *s* was not generated by a previous call to *l64a*( ).

The *l64a*( ) function shall take a **long** argument and return a pointer to the corresponding radix-64 representation. The behavior of *l64a*( ) is unspecified if *value* is negative.

The value returned by *l64a*( ) may be a pointer into a static buffer. Subsequent calls to *l64a*( ) may overwrite the buffer.

The *l64a*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *a64l*( ) shall return the **long** value resulting from conversion of the input string. If a string pointed to by *s* is an empty string, *a64l*( ) shall return 0L.

The *l64a*( ) function shall return a pointer to the radix-64 representation. If *value* is 0L, *l64a*( ) shall return a pointer to an empty string.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

If the type **long** contains more than 32 bits, the result of *a64l*(*l64a*(*x*)) is *x* in the low-order 32 bits.

RATIONALE

This is not the same encoding as used by either encoding variant of the *uuencode* utility.

FUTURE DIRECTIONS

None.

SEE ALSO

strtoul( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdlib.h>**, the Shell and Utilities volume of IEEE Std 1003.1-200x, *uuencode*

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section moved to the DESCRIPTION.

A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

NAME

abort — generate an abnormal process abort

SYNOPSIS

```
#include <stdlib.h>

void abort(void);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *abort*( ) function shall cause abnormal process termination to occur, unless the signal SIGABRT is being caught and the signal handler does not return.

CX The abnormal termination processing shall include at least the effect of *fclose*( ) on all open streams and the default actions defined for SIGABRT.

XSI On XSI-conformant systems, in addition the abnormal termination processing shall include the effect of *fclose*( ) on message catalog descriptors.

The SIGABRT signal shall be sent to the calling process as if by means of *raise*( ) with the argument SIGABRT.

CX The status made available to *wait*( ) or *waitpid*( ) by *abort*( ) shall be that of a process terminated by the SIGABRT signal. The *abort*( ) function shall override blocking or ignoring the SIGABRT signal.

RETURN VALUE

The *abort*( ) function shall not return.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Catching the signal is intended to provide the application writer with a portable means to abort processing, free from possible interference from any implementation-defined functions.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 6

Extensions beyond the ISO C standard are now marked.

NAME

abs — return an integer absolute value

SYNOPSIS

```
#include <stdlib.h>

int abs(int i);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *abs*( ) function shall compute the absolute value of its integer operand, *i*. If the result cannot be represented, the behavior is undefined.

RETURN VALUE

The *abs*( ) function shall return the absolute value of its integer operand.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

In two's-complement representation, the absolute value of the negative integer with largest magnitude {INT_MIN} might not be representable.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 6

Extensions beyond the ISO C standard are now marked.

NAME

accept — accept a new connection on a socket

SYNOPSIS

```
#include <sys/socket.h>

int accept(int socket, struct sockaddr *restrict address,
    socklen_t *restrict address_len);
```

DESCRIPTION

The *accept*( ) function shall extract the first connection on the queue of pending connections, create a new socket with the same socket type protocol and address family as the specified socket, and allocate a new file descriptor for that socket.

The *accept*( ) function takes the following arguments:

socket	Specifies a socket that was created with *socket*( ), has been bound to an address with *bind*( ), and has issued a successful call to *listen*( ).
address	Either a null pointer, or a pointer to a **sockaddr** structure where the address of the connecting socket shall be returned.
address_len	Points to a **socklen_t** structure which on input specifies the length of the supplied **sockaddr** structure, and on output specifies the length of the stored address.

If *address* is not a null pointer, the address of the peer for the accepted connection shall be stored in the **sockaddr** structure pointed to by *address*, and the length of this address shall be stored in the object pointed to by *address_len*.

If the actual length of the address is greater than the length of the supplied **sockaddr** structure, the stored address shall be truncated.

If the protocol permits connections by unbound clients, and the peer is not bound, then the value stored in the object pointed to by *address* is unspecified.

If the listen queue is empty of connection requests and O_NONBLOCK is not set on the file descriptor for the socket, *accept*( ) shall block until a connection is present. If the *listen*( ) queue is empty of connection requests and O_NONBLOCK is set on the file descriptor for the socket, *accept*( ) shall fail and set *errno* to [EAGAIN] or [EWOULDBLOCK].

The accepted socket cannot itself accept more connections. The original socket remains open and can accept more connections.

RETURN VALUE

Upon successful completion, *accept*( ) shall return the non-negative file descriptor of the accepted socket. Otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *accept*( ) function shall fail if:

[EAGAIN] or [EWOULDBLOCK]	O_NONBLOCK is set for the socket file descriptor and no connections are present to be accepted.
[EBADF]	The *socket* argument is not a valid file descriptor.
[ECONNABORTED]	A connection has been aborted.

[EINTR]	The *accept*( ) function was interrupted by a signal that was caught before a valid connection arrived.
[EINVAL]	The *socket* is not accepting connections.
[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
[ENFILE]	The maximum number of file descriptors in the system are already open.
[ENOTSOCK]	The *socket* argument does not refer to a socket.
[EOPNOTSUPP]	The socket type of the specified socket does not support accepting connections.

The *accept*( ) function may fail if:

[ENOBUFS]	No buffer space is available.
[ENOMEM]	There was insufficient memory available to complete the operation.
XSR [EPROTO]	A protocol error has occurred; for example, the STREAMS protocol stack has not been initialized.

EXAMPLES

None.

APPLICATION USAGE

When a connection is available, *select*( ) indicates that the file descriptor for the socket is ready for reading.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

bind( ), *connect*( ), *listen*( ), *socket*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/socket.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *accept*( ) prototype for alignment with the ISO / IEC 9899: 1999 standard.

NAME

access — determine accessibility of a file

SYNOPSIS

```
#include <unistd.h>

int access(const char *path, int amode);
```

DESCRIPTION

The *access*( ) function shall check the file named by the pathname pointed to by the *path* argument for accessibility according to the bit pattern contained in *amode*, using the real user ID in place of the effective user ID and the real group ID in place of the effective group ID.

The value of *amode* is either the bitwise-inclusive OR of the access permissions to be checked (R_OK, W_OK, X_OK) or the existence test (F_OK).

If any access permissions are checked, each shall be checked individually, as described in the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 3, Definitions. If the process has appropriate privileges, an implementation may indicate success for X_OK even if none of the execute file permission bits are set.

RETURN VALUE

If the requested access is permitted, *access*( ) succeeds and shall return 0; otherwise, −1 shall be returned and *errno* shall be set to indicate the error.

ERRORS

The *access*( ) function shall fail if:

[EACCES]	Permission bits of the file mode do not permit the requested access, or search permission is denied on a component of the path prefix.
[ELOOP]	A loop exists in symbolic links encountered during resolution of the *path* argument.
[ENAMETOOLONG]	The length of the *path* argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
[ENOENT]	A component of *path* does not name an existing file or *path* is an empty string.
[ENOTDIR]	A component of the path prefix is not a directory.
[EROFS]	Write access is requested for a file on a read-only file system.

The *access*( ) function may fail if:

[EINVAL]	The value of the *amode* argument is invalid.
[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.
[ENAMETOOLONG]	As a result of encountering a symbolic link in resolution of the *path* argument, the length of the substituted pathname string exceeded {PATH_MAX}.
[ETXTBSY]	Write access is requested for a pure procedure (shared text) file that is being executed.

EXAMPLES

Testing for the Existence of a File

The following example tests whether a file named **myfile** exists in the **/tmp** directory.

```
#include <unistd.h>
...
int result;
const char *filename = "/tmp/myfile";

result = access (filename, F_OK);
```

APPLICATION USAGE

Additional values of *amode* other than the set defined in the description may be valid; for example, if a system has extended access controls.

RATIONALE

In early proposals, some inadequacies in the *access*( ) function led to the creation of an *eaccess*( ) function because:

1. Historical implementations of *access*( ) do not test file access correctly when the process' real user ID is superuser. In particular, they always return zero when testing execute permissions without regard to whether the file is executable.

2. The superuser has complete access to all files on a system. As a consequence, programs started by the superuser and switched to the effective user ID with lesser privileges cannot use *access*( ) to test their file access permissions.

However, the historical model of *eaccess*( ) does not resolve problem (1), so this volume of IEEE Std 1003.1-200x now allows *access*( ) to behave in the desired way because several implementations have corrected the problem. It was also argued that problem (2) is more easily solved by using *open*( ), *chdir*( ), or one of the *exec* functions as appropriate and responding to the error, rather than creating a new function that would not be as reliable. Therefore, *eaccess*( ) is not included in this volume of IEEE Std 1003.1-200x.

The sentence concerning appropriate privileges and execute permission bits reflects the two possibilities implemented by historical implementations when checking superuser access for X_OK.

New implementations are discouraged from returning X_OK unless at least one execution permission bit is set.

FUTURE DIRECTIONS

None.

SEE ALSO

chmod( ), *stat*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

NAME

acos, acosf, acosl — arc cosine functions

SYNOPSIS

```
#include <math.h>

double acos(double x);
float acosf(float x);
long double acosl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the principal value of the arc cosine of their argument *x*. The value of *x* should be in the range [−1,1].

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the arc cosine of *x*, in the range [0,π] radians.

MX For finite values of *x* not in the range [−1,1], a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is +1, +0 shall be returned.

If *x* is ±Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

ERRORS

These functions shall fail if:

MX Domain Error The *x* argument is finite and is not in the range [−1,1], or is ±Inf.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *acosf*( ) and *acosl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

acosf — arc cosine functions

SYNOPSIS

```
#include <math.h>

float acosf(float x);
```

DESCRIPTION

Refer to *acos*( ).

NAME

acosh, acoshf, acoshl, — inverse hyperbolic cosine functions

SYNOPSIS

```
#include <math.h>

double acosh(double x);
float acoshf(float x);
long double acoshl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the inverse hyperbolic cosine of their argument *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the inverse hyperbolic cosine of their argument.

MX For finite values of $x < 1$, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is +1, +0 shall be returned.

If *x* is +Inf, +Inf shall be returned.

If *x* is –Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

ERRORS

These functions shall fail if:

MX Domain Error The *x* argument is finite and less than +1.0, or is –Inf.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

NAME

aio_cancel — cancel an asynchronous I/O request (**REALTIME**)

SYNOPSIS

AIO

```
#include <aio.h>

int aio_cancel(int fildes, struct aiocb *aiocbp);
```

DESCRIPTION

The *aio_cancel*( ) function shall attempt to cancel one or more asynchronous I/O requests currently outstanding against file descriptor *fildes*. The *aiocbp* argument points to the asynchronous I/O control block for a particular request to be canceled. If *aiocbp* is NULL, then all outstanding cancelable asynchronous I/O requests against *fildes* shall be canceled.

Normal asynchronous notification shall occur for asynchronous I/O operations that are successfully canceled. If there are requests that cannot be canceled, then the normal asynchronous completion process shall take place for those requests when they are completed.

For requested operations that are successfully canceled, the associated error status shall be set to [ECANCELED] and the return status shall be −1. For requested operations that are not successfully canceled, the *aiocbp* shall not be modified by *aio_cancel*( ).

If *aiocbp* is not NULL, then if *fildes* does not have the same value as the file descriptor with which the asynchronous operation was initiated, unspecified results occur.

Which operations are cancelable is implementation-defined.

RETURN VALUE

The *aio_cancel*( ) function shall return the value AIO_CANCELED to the calling process if the requested operation(s) were canceled. The value AIO_NOTCANCELED shall be returned if at least one of the requested operation(s) cannot be canceled because it is in progress. In this case, the state of the other operations, if any, referenced in the call to *aio_cancel*( ) is not indicated by the return value of *aio_cancel*( ). The application may determine the state of affairs for these operations by using *aio_error*( ). The value AIO_ALLDONE is returned if all of the operations have already completed. Otherwise, the function shall return −1 and set *errno* to indicate the error.

ERRORS

The *aio_cancel*( ) function shall fail if:

[EBADF]	The *fildes* argument is not a valid file descriptor.

EXAMPLES

None.

APPLICATION USAGE

The *aio_cancel*( ) function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

NAME

aio_error — retrieve errors status for an asynchronous I/O operation (**REALTIME**)

SYNOPSIS

AIO
```
#include <aio.h>

int aio_error(const struct aiocb *aiocbp);
```

DESCRIPTION

The *aio_error*( ) function shall return the error status associated with the **aiocb** structure referenced by the *aiocbp* argument. The error status for an asynchronous I/O operation is the SIO *errno* value that would be set by the corresponding *read*( ), *write*( ), *fdatasync*( ), or *fsync*( ) operation. If the operation has not yet completed, then the error status shall be equal to [EINPROGRESS].

RETURN VALUE

If the asynchronous I/O operation has completed successfully, then 0 shall be returned. If the asynchronous operation has completed unsuccessfully, then the error status, as described for SIO *read*( ), *write*( ), *fdatasync*( ), and *fsync*( ), shall be returned. If the asynchronous I/O operation has not yet completed, then [EINPROGRESS] shall be returned.

ERRORS

The *aio_error*( ) function may fail if:

[EINVAL]	The *aiocbp* argument does not refer to an asynchronous operation whose return status has not yet been retrieved.

EXAMPLES

None.

APPLICATION USAGE

The *aio_error*( ) function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

aio_fsync — asynchronous file synchronization (**REALTIME**)

SYNOPSIS

AIO

```
#include <aio.h>

int aio_fsync(int op, struct aiocb *aiocbp);

```

DESCRIPTION

The *aio_fsync*( ) function shall asynchronously force all I/O operations associated with the file indicated by the file descriptor *aio_fildes* member of the **aiocb** structure referenced by the *aiocbp* argument and queued at the time of the call to *aio_fsync*( ) to the synchronized I/O completion state. The function call shall return when the synchronization request has been initiated or queued to the file or device (even when the data cannot be synchronized immediately).

If *op* is O_DSYNC, all currently queued I/O operations shall be completed as if by a call to *fdatasync*( ); that is, as defined for synchronized I/O data integrity completion. If *op* is O_SYNC, all currently queued I/O operations shall be completed as if by a call to *fsync*( ); that is, as defined for synchronized I/O file integrity completion. If the *aio_fsync*( ) function fails, or if the operation queued by *aio_fsync*( ) fails, then, as for *fsync*( ) and *fdatasync*( ), outstanding I/O operations are not guaranteed to have been completed.

If *aio_fsync*( ) succeeds, then it is only the I/O that was queued at the time of the call to *aio_fsync*( ) that is guaranteed to be forced to the relevant completion state. The completion of subsequent I/O on the file descriptor is not guaranteed to be completed in a synchronized fashion.

The *aiocbp* argument refers to an asynchronous I/O control block. The *aiocbp* value may be used as an argument to *aio_error*( ) and *aio_return*( ) in order to determine the error status and return status, respectively, of the asynchronous operation while it is proceeding. When the request is queued, the error status for the operation is [EINPROGRESS]. When all data has been successfully transferred, the error status shall be reset to reflect the success or failure of the operation. If the operation does not complete successfully, the error status for the operation shall be set to indicate the error. The *aio_sigevent* member determines the asynchronous notification to occur as specified in Section 2.4.1 (on page 478) when all operations have achieved synchronized I/O completion. All other members of the structure referenced by *aiocbp* are ignored. If the control block referenced by *aiocbp* becomes an illegal address prior to asynchronous I/O completion, then the behavior is undefined.

If the *aio_fsync*( ) function fails or the *aiocbp* indicates an error condition, data is not guaranteed to have been successfully transferred.

RETURN VALUE

The *aio_fsync*( ) function shall return the value 0 to the calling process if the I/O operation is successfully queued; otherwise, the function shall return the value −1 and set *errno* to indicate the error.

ERRORS

The *aio_fsync*( ) function shall fail if:

[EAGAIN]	The requested asynchronous operation was not queued due to temporary resource limitations.
[EBADF]	The *aio_fildes* member of the **aiocb** structure referenced by the *aiocbp* argument is not a valid file descriptor open for writing.

[EINVAL]	This implementation does not support synchronized I/O for this file.
[EINVAL]	A value of *op* other than O_DSYNC or O_SYNC was specified.

In the event that any of the queued I/O operations fail, *aio_fsync*( ) shall return the error condition defined for *read*( ) and *write*( ). The error is returned in the error status for the asynchronous *fsync*( ) operation, which can be retrieved using *aio_error*( ).

EXAMPLES

None.

APPLICATION USAGE

The *aio_fsync*( ) function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

NAME

aio_read — asynchronous read from a file (**REALTIME**)

SYNOPSIS

AIO

```
#include <aio.h>

int aio_read(struct aiocb *aiocbp);
```

DESCRIPTION

The *aio_read*( ) function shall read *aiocbp*->*aio_nbytes* from the file associated with *aiocbp*->*aio_fildes* into the buffer pointed to by *aiocbp*->*aio_buf*. The function call shall return when the read request has been initiated or queued to the file or device (even when the data cannot be delivered immediately).

PIO If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted at a priority equal to the scheduling priority of the process minus *aiocbp*->*aio_reqprio*.

The *aiocbp* value may be used as an argument to *aio_error*( ) and *aio_return*( ) in order to determine the error status and return status, respectively, of the asynchronous operation while it is proceeding. If an error condition is encountered during queuing, the function call shall return without having initiated or queued the request. The requested operation takes place at the absolute position in the file as given by *aio_offset*, as if *lseek*( ) were called immediately prior to the operation with an *offset* equal to *aio_offset* and a *whence* equal to SEEK_SET. After a successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file is unspecified.

The *aiocbp*->*aio_lio_opcode* field shall be ignored by *aio_read*( ).

The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp*->*aio_buf* or the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O completion, then the behavior is undefined.

Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

SIO If synchronized I/O is enabled on the file associated with *aiocbp*->*aio_fildes*, the behavior of this function shall be according to the definitions of synchronized I/O data integrity completion and synchronized I/O file integrity completion.

For any system action that changes the process memory space while an asynchronous I/O is outstanding to the address range being changed, the result of that action is undefined.

For regular files, no data transfer shall occur past the offset maximum established in the open file description associated with *aiocbp*->*aio_fildes*.

RETURN VALUE

The *aio_read*( ) function shall return the value zero to the calling process if the I/O operation is successfully queued; otherwise, the function shall return the value −1 and set *errno* to indicate the error.

ERRORS

The *aio_read*( ) function shall fail if:

[EAGAIN] The requested asynchronous I/O operation was not queued due to system resource limitations.

Each of the following conditions may be detected synchronously at the time of the call to *aio_read*( ), or asynchronously. If any of the conditions below are detected synchronously, the *aio_read*( ) function shall return −1 and set *errno* to the corresponding value. If any of the conditions below are detected asynchronously, the return status of the asynchronous operation is set to −1, and the error status of the asynchronous operation is set to the corresponding value.

[EBADF]	The *aiocbp*->*aio_fildes* argument is not a valid file descriptor open for reading.
[EINVAL]	The file offset value implied by *aiocbp*->*aio_offset* would be invalid, *aiocbp*->*aio_reqprio* is not a valid value, or *aiocbp*->*aio_nbytes* is an invalid value.

In the case that the *aio_read*( ) successfully queues the I/O operation but the operation is subsequently canceled or encounters an error, the return status of the asynchronous operation is one of the values normally returned by the *read*( ) function call. In addition, the error status of the asynchronous operation is set to one of the error statuses normally set by the *read*( ) function call, or one of the following values:

[EBADF]	The *aiocbp*->*aio_fildes* argument is not a valid file descriptor open for reading.
[ECANCELED]	The requested I/O was canceled before the I/O completed due to an explicit *aio_cancel*( ) request.
[EINVAL]	The file offset value implied by *aiocbp*->*aio_offset* would be invalid.

The following condition may be detected synchronously or asynchronously:

[EOVERFLOW]	The file is a regular file, *aiobcp*->*aio_nbytes* is greater than 0, and the starting offset in *aiobcp*->*aio_offset* is before the end-of-file and is at or beyond the offset maximum in the open file description associated with *aiocbp*->*aio_fildes*.

EXAMPLES

None.

APPLICATION USAGE

The *aio_read*( ) function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support large files.

NAME

aio_return — retrieve return status of an asynchronous I/O operation (**REALTIME**)

SYNOPSIS

AIO

```
#include <aio.h>

ssize_t aio_return(struct aiocb *aiocbp);
```

DESCRIPTION

The *aio_return*( ) function shall return the return status associated with the **aiocb** structure referenced by the *aiocbp* argument. The return status for an asynchronous I/O operation is the value that would be returned by the corresponding *read*( ), *write*( ), or *fsync*( ) function call. If the error status for the operation is equal to [EINPROGRESS], then the return status for the operation is undefined. The *aio_return*( ) function may be called exactly once to retrieve the return status of a given asynchronous operation; thereafter, if the same **aiocb** structure is used in a call to *aio_return*( ) or *aio_error*( ), an error may be returned. When the **aiocb** structure referred to by *aiocbp* is used to submit another asynchronous operation, then *aio_return*( ) may be successfully used to retrieve the return status of that operation.

RETURN VALUE

If the asynchronous I/O operation has completed, then the return status, as described for *read*( ), *write*( ), and *fsync*( ), shall be returned. If the asynchronous I/O operation has not yet completed, the results of *aio_return*( ) are undefined.

ERRORS

The *aio_return*( ) function may fail if:

[EINVAL]	The *aiocbp* argument does not refer to an asynchronous operation whose return status has not yet been retrieved.

EXAMPLES

None.

APPLICATION USAGE

The *aio_return*( ) function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

aio_cancel( ), *aio_error*( ), *aio_fsync*( ), *aio_read*( ), *aio_write*( ), *close*( ), *exec*, *exit*( ), *fork*( ), *lio_listio*( ), *lseek*( ), *read*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<aio.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

The [EINVAL] error condition is updated as a ‘‘may fail’’. This is for consistency with the DESCRIPTION.

NAME

aio_suspend — wait for an asynchronous I/O request (**REALTIME**)

SYNOPSIS

AIO

```
#include <aio.h>

int aio_suspend(const struct aiocb * const list[], int nent,
    const struct timespec *timeout);
```

DESCRIPTION

The *aio_suspend*( ) function shall suspend the calling thread until at least one of the asynchronous I/O operations referenced by the *list* argument has completed, until a signal interrupts the function, or, if *timeout* is not NULL, until the time interval specified by *timeout* has passed. If any of the **aiocb** structures in the list correspond to completed asynchronous I/O operations (that is, the error status for the operation is not equal to [EINPROGRESS]) at the time of the call, the function shall return without suspending the calling thread. The *list* argument is an array of pointers to asynchronous I/O control blocks. The *nent* argument indicates the number of elements in the array. Each **aiocb** structure pointed to has been used in initiating an asynchronous I/O request via *aio_read*( ), *aio_write*( ), or *lio_listio*( ). This array may contain NULL pointers, which are ignored. If this array contains pointers that refer to **aiocb** structures that have not been used in submitting asynchronous I/O, the effect is undefined.

If the time interval indicated in the **timespec** structure pointed to by *timeout* passes before any of the I/O operations referenced by *list* are completed, then *aio_suspend*( ) shall return with an error. MON If the Monotonic Clock option is supported, the clock that shall be used to measure this time interval shall be the CLOCK_MONOTONIC clock.

RETURN VALUE

If the *aio_suspend*( ) function returns after one or more asynchronous I/O operations have completed, the function shall return zero. Otherwise, the function shall return a value of −1 and set *errno* to indicate the error.

The application may determine which asynchronous I/O completed by scanning the associated error and return status using *aio_error*( ) and *aio_return*( ), respectively.

ERRORS

The *aio_suspend*( ) function shall fail if:

[EAGAIN]	No asynchronous I/O indicated in the list referenced by *list* completed in the time interval indicated by *timeout*.
[EINTR]	A signal interrupted the *aio_suspend*( ) function. Note that, since each asynchronous I/O operation may possibly provoke a signal when it completes, this error return may be caused by the completion of one (or more) of the very I/O operations being awaited.

EXAMPLES

None.

APPLICATION USAGE

The *aio_suspend*( ) function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the CLOCK_MONOTONIC clock, if supported, is used.

NAME

aio_write — asynchronous write to a file (**REALTIME**)

SYNOPSIS

AIO

```
#include <aio.h>

int aio_write(struct aiocb *aiocbp);
```

DESCRIPTION

The *aio_write*( ) function shall write *aiocbp*->*aio_nbytes* to the file associated with *aiocbp*->*aio_fildes* from the buffer pointed to by *aiocbp*->*aio_buf*. The function shall return when the write request has been initiated or, at a minimum, queued to the file or device.

PIO If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted at a priority equal to the scheduling priority of the process minus *aiocbp*->*aio_reqprio*.

The *aiocbp* may be used as an argument to *aio_error*( ) and *aio_return*( ) in order to determine the error status and return status, respectively, of the asynchronous operation while it is proceeding.

The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp*->*aio_buf* or the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O completion, then the behavior is undefined.

If O_APPEND is not set for the file descriptor *aio_fildes*, then the requested operation shall take place at the absolute position in the file as given by *aio_offset*, as if *lseek*( ) were called immediately prior to the operation with an *offset* equal to *aio_offset* and a *whence* equal to SEEK_SET. If O_APPEND is set for the file descriptor, write operations append to the file in the same order as the calls were made. After a successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file is unspecified.

The *aiocbp*->*aio_lio_opcode* field shall be ignored by *aio_write*( ).

Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

SIO If synchronized I/O is enabled on the file associated with *aiocbp*->*aio_fildes*, the behavior of this function shall be according to the definitions of synchronized I/O data integrity completion, and synchronized I/O file integrity completion.

For any system action that changes the process memory space while an asynchronous I/O is outstanding to the address range being changed, the result of that action is undefined.

For regular files, no data transfer shall occur past the offset maximum established in the open file description associated with *aiocbp*->*aio_fildes*.

RETURN VALUE

The *aio_write*( ) function shall return the value zero to the calling process if the I/O operation is successfully queued; otherwise, the function shall return the value −1 and set *errno* to indicate the error.

ERRORS

The *aio_write*( ) function shall fail if:

[EAGAIN] The requested asynchronous I/O operation was not queued due to system resource limitations.

Each of the following conditions may be detected synchronously at the time of the call to *aio_write*( ), or asynchronously. If any of the conditions below are detected synchronously, the *aio_write*( ) function shall return −1 and set *errno* to the corresponding value. If any of the conditions below are detected asynchronously, the return status of the asynchronous operation shall be set to −1, and the error status of the asynchronous operation is set to the corresponding value.

[EBADF]	The *aiocbp*->*aio_fildes* argument is not a valid file descriptor open for writing.
[EINVAL]	The file offset value implied by *aiocbp*->*aio_offset* would be invalid, *aiocbp*->*aio_reqprio* is not a valid value, or *aiocbp*->*aio_nbytes* is an invalid value.

In the case that the *aio_write*( ) successfully queues the I/O operation, the return status of the asynchronous operation shall be one of the values normally returned by the *write*( ) function call. If the operation is successfully queued but is subsequently canceled or encounters an error, the error status for the asynchronous operation contains one of the values normally set by the *write*( ) function call, or one of the following:

[EBADF]	The *aiocbp*->*aio_fildes* argument is not a valid file descriptor open for writing.
[EINVAL]	The file offset value implied by *aiocbp*->*aio_offset* would be invalid.
[ECANCELED]	The requested I/O was canceled before the I/O completed due to an explicit *aio_cancel*( ) request.

The following condition may be detected synchronously or asynchronously:

[EFBIG]	The file is a regular file, *aiobcp*->*aio_nbytes* is greater than 0, and the starting offset in *aiobcp*->*aio_offset* is at or beyond the offset maximum in the open file description associated with *aiocbp*->*aio_fildes*.

EXAMPLES

None.

APPLICATION USAGE

The *aio_write*( ) function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

aio_cancel( ), *aio_error*( ), *aio_read*( ), *aio_return*( ), *close*( ), *exec*, *exit*( ), *fork*( ), *lio_listio*( ), *lseek*( ), *write*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<aio.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs past the offset maximum established in the open file description associated with *aiocbp*->*aio_fildes*.

- The [EFBIG] error is added as part of the large file support extensions.

NAME

alarm — schedule an alarm signal

SYNOPSIS

```
#include <unistd.h>

unsigned alarm(unsigned seconds);
```

DESCRIPTION

The *alarm*( ) function shall cause the system to generate a SIGALRM signal for the process after the number of realtime seconds specified by *seconds* have elapsed. Processor scheduling delays may prevent the process from handling the signal as soon as it is generated.

If *seconds* is 0, a pending alarm request, if any, is canceled.

Alarm requests are not stacked; only one SIGALRM generation can be scheduled in this manner. If the SIGALRM signal has not yet been generated, the call shall result in rescheduling the time at which the SIGALRM signal is generated.

XSI Interactions between *alarm*( ) and any of *setitimer*( ), *ualarm*( ), or *usleep*( ) are unspecified.

RETURN VALUE

If there is a previous *alarm*( ) request with time remaining, *alarm*( ) shall return a non-zero value that is the number of seconds until the previous request would have generated a SIGALRM signal. Otherwise, *alarm*( ) shall return 0.

ERRORS

The *alarm*( ) function is always successful, and no return value is reserved to indicate an error.

EXAMPLES

None.

APPLICATION USAGE

The *fork*( ) function clears pending alarms in the child process. A new process image created by one of the *exec* functions inherits the time left to an alarm signal in the old process' image.

Application writers should note that the type of the argument *seconds* and the return value of *alarm*( ) is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces Application cannot pass a value greater than the minimum guaranteed value for {UINT_MAX}, which the ISO C standard sets as 65 535, and any application passing a larger value is restricting its portability. A different type was considered, but historical implementations, including those with a 16-bit **int** type, consistently use either **unsigned** or **int**.

Application writers should be aware of possible interactions when the same process uses both the *alarm*( ) and *sleep*( ) functions.

RATIONALE

Many historical implementations (including Version 7 and System V) allow an alarm to occur up to a second early. Other implementations allow alarms up to half a second or one clock tick early or do not allow them to occur early at all. The latter is considered most appropriate, since it gives the most predictable behavior, especially since the signal can always be delayed for an indefinite amount of time due to scheduling. Applications can thus choose the *seconds* argument as the minimum amount of time they wish to have elapse before the signal.

The term *realtime* here and elsewhere (*sleep*( ), *times*( )) is intended to mean ''wall clock'' time as common English usage, and has nothing to do with ''realtime operating systems''. It is in contrast to *virtual time*, which could be misinterpreted if just *time* were used.

In some implementations, including 4.3 BSD, very large values of the *seconds* argument are silently rounded down to an implementation-defined maximum value. This maximum is large enough (on the order of several months) that the effect is not noticeable.

There were two possible choices for alarm generation in multi-threaded applications: generation for the calling thread or generation for the process. The first option would not have been particularly useful since the alarm state is maintained on a per-process basis and the alarm that is established by the last invocation of *alarm*( ) is the only one that would be active.

Furthermore, allowing generation of an asynchronous signal for a thread would have introduced an exception to the overall signal model. This requires a compelling reason in order to be justified.

FUTURE DIRECTIONS

None.

SEE ALSO

alarm( ), *exec*, *fork*( ), *getitimer*( ), *pause*( ), *sigaction*( ), *sleep*( ), *ualarm*( ), *usleep*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<signal.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to indicate that interactions with the *setitimer*( ), *ualarm*( ), and *usleep*( ) functions are unspecified.

NAME

asctime, asctime_r — convert date and time to a string

SYNOPSIS

```
#include <time.h>

char *asctime(const struct tm *timeptr);
char *asctime_r(const struct tm *restrict tm, char *restrict buf);
```

TSF (asctime_r)

DESCRIPTION

CX For *asctime*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *asctime*( ) function shall convert the broken-down time in the structure pointed to by *timeptr* into a string in the form:

```
Sun Sep 16 01:03:52 1973\n\0
```

using the equivalent of the following algorithm:

```
char *asctime(const struct tm *timeptr)
{
    static char wday_name[7][3] = {
        "Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat"
    };
    static char mon_name[12][3] = {
        "Jan", "Feb", "Mar", "Apr", "May", "Jun",
        "Jul", "Aug", "Sep", "Oct", "Nov", "Dec"
    };
    static char result[26];

    sprintf(result, "%.3s %.3s%3d %.2d:%.2d:%.2d %d\n",
        wday_name[timeptr->tm_wday],
        mon_name[timeptr->tm_mon],
        timeptr->tm_mday, timeptr->tm_hour,
        timeptr->tm_min, timeptr->tm_sec,
        1900 + timeptr->tm_year);
    return result;
}
```

The **tm** structure is defined in the **<time.h>** header.

CX The *asctime*( ), *ctime*( ), *gmtime*( ), and *localtime*( ) functions shall return values in one of two static objects: a broken-down time structure and an array of type **char**. Execution of any of the functions may overwrite the information returned in either of these objects by any of the other functions.

The *asctime*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

TSF The *asctime_r*( ) function shall convert the broken-down time in the structure pointed to by *tm* into a string (of the same form as that returned by *asctime*( )) that is placed in the user-supplied buffer pointed to by *buf* (which shall contain at least 26 bytes) and then return *buf*.

RETURN VALUE

Upon successful completion, *asctime*( ) shall return a pointer to the string.

TSF Upon successful completion, *asctime_r*( ) shall return a pointer to a character string containing the date and time. This string is pointed to by the argument *buf*. If the function is unsuccessful, it shall return NULL.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Values for the broken-down time structure can be obtained by calling *gmtime*( ) or *localtime*( ). This function is included for compatibility with older implementations, and does not support localized date and time formats. Applications should use *strftime*( ) to achieve maximum portability.

The *asctime_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

clock( ), *ctime*( ), *difftime*( ), *gmtime*( ), *localtime*( ), *mktime*( ), *strftime*( ), *strptime*( ), *time*( ), *utime*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<time.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

The *asctime_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *asctime*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *asctime_r*( ) function is marked as part of the Thread-Safe Functions option.

Extensions beyond the ISO C standard are now marked.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The DESCRIPTION of *asctime_r*( ) is updated to describe the format of the string returned.

The **restrict** keyword is added to the *asctime_r*( ) prototype for alignment with the ISO / IEC 9899: 1999 standard.

NAME

asin, asinf, asinl — arc sine function

SYNOPSIS

```
#include <math.h>

double asin(double x);
float asinf(float x);
long double asinl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the principal value of the arc sine of their argument *x*. The value of *x* should be in the range [−1,1].

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the arc sine of *x*, in the range $[-\pi/2,\pi/2]$ radians.

MX For finite values of *x* not in the range [−1,1], a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, *x* shall be returned.

If *x* is ±Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If *x* is subnormal, a range error may occur and *x* should be returned.

ERRORS

These functions shall fail if:

MX Domain Error	The *x* argument is finite and is not in the range [−1,1], or is ±Inf. If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

MX Range Error	The value of *x* is subnormal. If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

The *asinhf*( ), and *asinhl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

asinl — arc sine function

SYNOPSIS

```
#include <math.h>
```

```
long double asinl(long double x);
```

DESCRIPTION

Refer to *asin*( ).

NAME

assert — insert program diagnostics

SYNOPSIS

```
#include <assert.h>

void assert(scalar expression);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *assert*( ) macro shall insert diagnostics into programs; it shall expand to a **void** expression. When it is executed, if *expression* (which shall have a **scalar** type) is false (that is, compares equal to 0), *assert*( ) shall write information about the particular call that failed on *stderr* and shall call *abort*( ). |

The information written about the call that failed shall include the text of the argument, the name of the source file, the source file line number, and the name of the enclosing function, the latter are, respectively, the values of the preprocessing macros __FILE__ and __LINE__ and of the identifier __func__.

Forcing a definition of the name NDEBUG, either from the compiler command line or with the preprocessor control statement **#define** NDEBUG ahead of the **#include <assert.h>** statement, shall stop assertions from being compiled into the program.

RETURN VALUE

The *assert*( ) macro shall not return a value.

ERRORS

No errors are defined.

The prototype for the *expression* argument to *assert*( ) is changed from **int** to **scalar** for alignment with the ISO / IEC 9899: 1999 standard.

The DESCRIPTION of *assert*( ) is updated for alignment with the ISO / IEC 9899: 1999 standard.

NAME

atan, atanf, atanl — arc tangent function

SYNOPSIS

```
#include <math.h>

double atan(double x);
float atanf(float x);
long double atanl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the principal value of the arc tangent of their argument *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the arc tangent of *x* in the range [−π/2,π/2] radians.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0 *x* shall be returned.

If *x* is ±Inf, ±π/2 shall be returned.

If *x* is subnormal, a range error may occur and *x* should be returned.

ERRORS

These functions may fail if:

MX Range Error The value of *x* is subnormal.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised. |

EXAMPLES

NAME

atan2, atan2f, atan2l — arc tangent functions

SYNOPSIS

```
#include <math.h>

double atan2(double y, double x);
float atan2f(float y, float x);
long double atan2l(long double y, long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the principal value of the arc tangent of y/x, using the signs of both arguments to determine the quadrant of the return value.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the arc tangent of y/x in the range $[-\pi,\pi]$ radians.

If y is ±0 and x is < 0, $\pm\pi$ shall be returned.

If y is ±0 and x is > 0, ±0 shall be returned.

If y is < 0 and x is ±0, $-\pi/2$ shall be returned.

If y is > 0 and x is ±0, $\pi/2$ shall be returned.

If x is 0, a pole error shall not occur.

MX If either x or y is NaN, a NaN shall be returned.

If the result underflows, a range error may occur and y/x should be returned.

If y is ±0 and x is −0, $\pm\pi$ shall be returned.

If y is ±0 and x is +0, ±0 shall be returned.

For finite values of $\pm y > 0$, if x is −Inf, $\pm\pi$ shall be returned.

For finite values of $\pm y > 0$, if x is +Inf, ±0 shall be returned.

For finite values of x, if y is ±Inf, $\pm\pi/2$ shall be returned.

If y is ±Inf and x is −Inf, $\pm 3\pi/4$ shall be returned.

If y is ±Inf and x is +Inf, $\pm\pi/4$ shall be returned.

If both arguments are 0, a domain error shall not occur.

ERRORS

These functions may fail if:

MX

Range Error	The result underflows. If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression

(math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

NAME

atanf — arc tangent function

SYNOPSIS

```
#include <math.h>

float atanf(float x);
```

DESCRIPTION

Refer to *atan*( ).

NAME

atanh, atanhf, atanhl — inverse hyperbolic tangent functions

SYNOPSIS

```
#include <math.h>

double atanh(double x);
float atanhf(float x);
long double atanhl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the inverse hyperbolic tangent of their argument *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the inverse hyperbolic tangent of their argument.

If *x* is ±1, a pole error shall occur, and *atanh*( ), *atanhf*( ), and *atanhl*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively, with the same sign as the correct value of the function.

MX For finite |*x*|>1, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, *x* shall be returned.

If *x* is ±Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If *x* is subnormal, a range error may occur and *x* should be returned.

ERRORS

These functions shall fail if:

MX Domain Error The *x* argument is finite and not in the range [−1,1], or is ±Inf.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised. |

Pole Error The *x* argument is ±1.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the divide-by-zero floating-point exception shall be raised. |

These functions may fail if:

MX **Range Error** The value of *x* is subnormal.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

The *atanhf*( ), and *atanhl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

atanl — arc tangent function

SYNOPSIS

```
#include <math.h>

long double atanl(long double x);
```

DESCRIPTION

Refer to *atan*( ).

NAME

atexit — register a function to run at process termination

SYNOPSIS

```
#include <stdlib.h>

int atexit(void (*func)(void));
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *atexit*( ) function shall register the function pointed to by *func*, to be called without arguments at normal program termination. At normal program termination, all functions registered by the *atexit*( ) function shall be called, in the reverse order of their registration, except that a function is called after any previously registered functions that had already been called at the time it was registered. Normal termination occurs either by a call to *exit*( ) or a return from *main*( ).

At least 32 functions can be registered with *atexit*( ).

CX After a successful call to any of the *exec* functions, any functions previously registered by *atexit*( ) shall no longer be registered.

RETURN VALUE

Upon successful completion, *atexit*( ) shall return 0; otherwise, it shall return a non-zero value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The functions registered by a call to *atexit*( ) must return to ensure that all registered functions are called.

The application should call *sysconf*( ) to obtain the value of {ATEXIT_MAX}, the number of functions that can be registered. There is no way for an application to tell how many functions have already been registered with *atexit*( ).

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

exit( ), *sysconf*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdlib.h>**

CHANGE HISTORY

First released in Issue 4. Derived from the ANSI C standard.

Issue 6

Extensions beyond the ISO C standard are now marked.

The DESCRIPTION is updated for alignment with the ISO/IEC 9899: 1999 standard.

NAME

atof — convert a string to double-precision number

SYNOPSIS

```
#include <stdlib.h>

double atof(const char *str);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The call *atof*(*str*) shall be equivalent to:

```
strtod(str,(char **)NULL),
```

except that the handling of errors may differ. If the value cannot be represented, the behavior is undefined.

RETURN VALUE

The *atof*( ) function shall return the converted value if the value can be represented.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *atof*( ) function is subsumed by *strtod*( ) but is retained because it is used extensively in existing code. If the number is not known to be in range, *strtod*( ) should be used because *atof*( ) is not required to perform any error checking.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

strtod( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdlib.h>**

CHANGE HISTORY

NAME

atoi — convert a string to an integer

SYNOPSIS

```
#include <stdlib.h>

int atoi(const char *str);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The call *atoi*(*str*) shall be equivalent to:

```
(int) strtol(str, (char **)NULL, 10)
```

except that the handling of errors may differ. If the value cannot be represented, the behavior is undefined.

RETURN VALUE

The *atoi*( ) function shall return the converted value if the value can be represented.

ERRORS

No errors are defined.

EXAMPLES

Converting an Argument

The following example checks for proper usage of the program. If there is an argument and the decimal conversion of this argument (obtained using *atoi*( )) is greater than 0, then the program has a valid number of minutes to wait for an event.

```
#include <stdlib.h>
#include <stdio.h>
...
int minutes_to_event;
...
if (argc < 2 || ((minutes_to_event = atoi (argv[1]))) <= 0) {
   fprintf(stderr, "Usage: %s minutes\n", argv[0]); exit(1);
}
...
```

APPLICATION USAGE

The *atoi*( ) function is subsumed by *strtol*( ) but is retained because it is used extensively in existing code. If the number is not known to be in range, *strtol*( ) should be used because *atoi*( ) is not required to perform any error checking.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

atol, atoll — convert a string to a long integer

SYNOPSIS

```
#include <stdlib.h>

long atol(const char *str);
long long atoll(const char *nptr);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The call *atol*(*str*) shall be equivalent to:

```
strtol(str, (char **)NULL, 10)
```

The call *atoll*(*str*) shall be equivalent to:

```
strtoll(nptr, (char **)NULL, 10)
```

except that the handling of errors may differ. If the value cannot be represented, the behavior is undefined.

RETURN VALUE

These functions shall return the converted value if the value can be represented.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *atol*( ) function is subsumed by *strtol*( ) but is retained because it is used extensively in existing code. If the number is not known to be in range, *strtol*( ) should be used because *atol*( ) is not required to perform any error checking.

The *atoll*( ) function is added for alignment with the ISO/IEC 9899: 1999 standard.

NAME

basename — return the last component of a pathname

SYNOPSIS

XSI
```
#include <libgen.h>

char *basename(char *path);
```

DESCRIPTION

The *basename*( ) function shall take the pathname pointed to by *path* and return a pointer to the final component of the pathname, deleting any trailing `'/'` characters.

If the string consists entirely of the `'/'` character, *basename*( ) shall return a pointer to the string `"/"`. If the string is exactly `"//"`, it is implementation-defined whether `'/'` or `"//"` is returned.

If *path* is a null pointer or points to an empty string, *basename*( ) shall return a pointer to the string `"."`.

The *basename*( ) function may modify the string pointed to by *path*, and may return a pointer to static storage that may then be overwritten by a subsequent call to *basename*( ).

The *basename*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

The *basename*( ) function shall return a pointer to the final component of *path*.

ERRORS

No errors are defined.

EXAMPLES

Using basename( )

The following program fragment returns a pointer to the value *lib*, which is the base name of **/usr/lib**.

```
#include <libgen.h>
...
char *name = "/usr/lib";
char *base;

base = basename(name);
...
```

Sample Input and Output Strings for basename( )

In the following table, the input string is the value pointed to by *path*, and the output string is the return value of the *basename*( ) function.

Input String	Output String
`"/usr/lib"`	`"lib"`
`"/usr/"`	`"usr"`
`"/"`	`"/"`

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

NAME

bcmp — memory operations (**LEGACY**)

SYNOPSIS

XSI

```
#include <strings.h>

int bcmp(const void *s1, const void *s2, size_t n);
```

DESCRIPTION

The *bcmp*( ) function shall compare the first *n* bytes of the area pointed to by *s1* with the area pointed to by *s2*.

RETURN VALUE

The *bcmp*( ) function shall return 0 if *s1* and *s2* are identical; otherwise, it shall return non-zero. Both areas are assumed to be *n* bytes long. If the value of *n* is 0, *bcmp*( ) shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

memcmp( ) is preferred over this function.

For maximum portability, it is recommended to replace the function call to *bcmp*( ) as follows:

```
#define bcmp(b1,b2,len) memcmp((b1), (b2), (size_t)(len))
```

RATIONALE

None.

FUTURE DIRECTIONS

This function may be withdrawn in a future version.

SEE ALSO

memcmp( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<strings.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

This function is marked LEGACY.

NAME

bcopy — memory operations (**LEGACY**)

SYNOPSIS

XSI

```
#include <strings.h>

void bcopy(const void *s1, void *s2, size_t n);
```

DESCRIPTION

The *bcopy*( ) function shall copy *n* bytes from the area pointed to by *s1* to the area pointed to by *s2*.

The bytes are copied correctly even if the area pointed to by *s1* overlaps the area pointed to by *s2*.

RETURN VALUE

The *bcopy*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

memmove( ) is preferred over this function.

The following are approximately equivalent (note the order of the arguments):

```
bcopy(s1,s2,n) ~= memmove(s2,s1,n)
```

For maximum portability, it is recommended to replace the function call to *bcopy*( ) as follows:

```
#define bcopy(b1,b2,len) (memmove((b2), (b1), (len)), (void) 0)
```

RATIONALE

None.

FUTURE DIRECTIONS

This function may be withdrawn in a future version.

SEE ALSO

memmove( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<strings.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

This function is marked LEGACY.

NAME

bind — bind a name to a socket

SYNOPSIS

```
#include <sys/socket.h>

int bind(int socket, const struct sockaddr *address,
    socklen_t address_len);
```

DESCRIPTION

The *bind*( ) function shall assign a local socket address *address* to a socket identified by descriptor *socket* that has no local socket address assigned. Sockets created with the *socket*( ) function are initially unnamed; they are identified only by their address family.

The *bind*( ) function takes the following arguments:

socket	Specifies the file descriptor of the socket to be bound.
address	Points to a **sockaddr** structure containing the address to be bound to the socket. The length and format of the address depend on the address family of the socket.
address_len	Specifies the length of the **sockaddr** structure pointed to by the *address* argument.

The socket specified by *socket* may require the process to have appropriate privileges to use the *bind*( ) function.

RETURN VALUE

Upon successful completion, *bind*( ) shall return 0; otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *bind*( ) function shall fail if:

[EADDRINUSE]	The specified address is already in use.
[EADDRNOTAVAIL]	The specified address is not available from the local machine.
[EAFNOSUPPORT]	The specified address is not a valid address for the address family of the specified socket.
[EBADF]	The *socket* argument is not a valid file descriptor.
[EINVAL]	The socket is already bound to an address, and the protocol does not support binding to a new address; or the socket has been shut down.
[ENOTSOCK]	The *socket* argument does not refer to a socket.
[EOPNOTSUPP]	The socket type of the specified socket does not support binding to an address.

If the address family of the socket is AF_UNIX, then *bind*( ) shall fail if:

[EACCES]	A component of the path prefix denies search permission, or the requested name requires writing in a directory with a mode that denies write permission.

[EDESTADDRREQ] or [EISDIR]
The *address* argument is a null pointer.

[EIO] An I/O error occurred.

[ELOOP] A loop exists in symbolic links encountered during resolution of the pathname in *address*.

[ENAMETOOLONG]
A component of a pathname exceeded {NAME_MAX} characters, or an entire pathname exceeded {PATH_MAX} characters.

[ENOENT] A component of the pathname does not name an existing file or the pathname is an empty string.

[ENOTDIR] A component of the path prefix of the pathname in *address* is not a directory.

[EROFS] The name would reside on a read-only file system.

The *bind*( ) function may fail if:

[EACCES] The specified address is protected and the current user does not have permission to bind to it.

[EINVAL] The *address_len* argument is not a valid length for the address family.

[EISCONN] The socket is already connected.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in *address*.

[ENAMETOOLONG]
Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.

[ENOBUFS] Insufficient resources were available to complete the call.

EXAMPLES

None.

APPLICATION USAGE

An application program can retrieve the assigned socket name with the *getsockname*( ) function.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

connect( ), *getsockname*( ), *listen*( ), *socket*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/socket.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

bsd_signal — simplified signal facilities

SYNOPSIS

OB XSI
```
#include <signal.h>

void (*bsd_signal(int sig, void (*func)(int)))(int);
```

DESCRIPTION

The *bsd_signal*( ) function provides a partially compatible interface for programs written to historical system interfaces (see APPLICATION USAGE).

The function call *bsd_signal*(*sig*, *func*) shall be equivalent to the following:

```
void (*bsd_signal(int sig, void (*func)(int)))(int)
{
    struct sigaction act, oact;

    act.sa_handler = func;
    act.sa_flags = SA_RESTART;
    sigemptyset(&act.sa_mask);
    sigaddset(&act.sa_mask, sig);
    if (sigaction(sig, &act, &oact) == -1)
        return(SIG_ERR);
    return(oact.sa_handler);
}
```

The handler function should be declared:

```
void handler(int sig);
```

where *sig* is the signal number. The behavior is undefined if *func* is a function that takes more than one argument, or an argument of a different type.

RETURN VALUE

Upon successful completion, *bsd_signal*( ) shall return the previous action for *sig*. Otherwise, SIG_ERR shall be returned and *errno* shall be set to indicate the error.

ERRORS

Refer to *sigaction*( ).

EXAMPLES

None.

APPLICATION USAGE

This function is a direct replacement for the BSD *signal*( ) function for simple applications that are installing a single-argument signal handler function. If a BSD signal handler function is being installed that expects more than one argument, the application has to be modified to use *sigaction*( ). The *bsd_signal*( ) function differs from *signal*( ) in that the SA_RESTART flag is set and the SA_RESETHAND is clear when *bsd_signal*( ) is used. The state of these flags is not specified for *signal*( ).

It is recommended that new applications use the *sigaction*( ) function.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

sigaction( ), *sigaddset*( ), *sigemptyset*( ), *signal*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<signal.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

This function is marked obsolescent.

NAME

bsearch — binary search a sorted table

SYNOPSIS

```
#include <stdlib.h>

void *bsearch(const void *key, const void *base, size_t nel,
    size_t width, int (*compar)(const void *, const void *));
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *bsearch*( ) function shall search an array of *nel* objects, the initial element of which is pointed to by *base*, for an element that matches the object pointed to by *key*. The size of each element in the array is specified by *width*.

The comparison function pointed to by *compar* shall be called with two arguments that point to the *key* object and to an array element, in that order.

The application shall ensure that the function returns an integer less than, equal to, or greater than 0 if the *key* object is considered, respectively, to be less than, to match, or to be greater than the array element. The application shall ensure that the array consists of all the elements that compare less than, all the elements that compare equal to, and all the elements that compare greater than the *key* object, in that order.

RETURN VALUE

The *bsearch*( ) function shall return a pointer to a matching member of the array, or a null pointer if no match is found. If two or more members compare equal, which member is returned is unspecified.

ERRORS

No errors are defined.

EXAMPLES

The example below searches a table containing pointers to nodes consisting of a string and its length. The table is ordered alphabetically on the string in the node pointed to by each entry.

The code fragment below reads in strings and either finds the corresponding node and prints out the string and its length, or prints an error message.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>

#define TABSIZE    1000

struct node {                  /* These are stored in the table. */
    char *string;
    int length;
};
struct node table[TABSIZE];    /* Table to be searched. */
    .
    .
    .
{
    struct node *node_ptr, node;
    /* routine to compare 2 nodes */
```

```
        int node_compare(const void *, const void *);
        char str_space[20];   /* Space to read string into. */
        .
        .
        .
        node.string = str_space;
        while (scanf("%s", node.string) != EOF) {
            node_ptr = (struct node *)bsearch((void *)(&node),
                   (void *)table, TABSIZE,
                   sizeof(struct node), node_compare);
            if (node_ptr != NULL) {
                (void)printf("string = %20s, length = %d\n",
                    node_ptr->string, node_ptr->length);
            } else {
                (void)printf("not found: %s\n", node.string);
            }
        }
    }
    /*
        This routine compares two nodes based on an
        alphabetical ordering of the string field.
    */
    int
    node_compare(const void *node1, const void *node2)
    {
        return strcoll(((const struct node *)node1)->string,
            ((const struct node *)node2)->string);
    }
```

APPLICATION USAGE

The pointers to the key and the element at the base of the table should be of type pointer-to-element.

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

In practice, the array is usually sorted according to the comparison function.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

NAME

btowc — single byte to wide character conversion

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

wint_t btowc(int c);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *btowc*( ) function shall determine whether *c* constitutes a valid (one-byte) character in the initial shift state.

The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale.

RETURN VALUE

The *btowc*( ) function shall return WEOF if *c* has the value EOF or if **(unsigned char)** *c* does not constitute a valid (one-byte) character in the initial shift state. Otherwise, it shall return the wide-character representation of that character.

ERRORS

No errors are defined.

NAME

bzero — memory operations (**LEGACY**)

SYNOPSIS

XSI

```
#include <strings.h>

void bzero(void *s, size_t n);
```

DESCRIPTION

The *bzero*( ) function shall place *n* zero-valued bytes in the area pointed to by *s*.

RETURN VALUE

The *bzero*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

memset( ) is preferred over this function.

For maximum portability, it is recommended to replace the function call to *bzero*( ) as follows:

```
#define bzero(b,len) (memset((b), '\0', (len)), (void) 0)
```

RATIONALE

None.

NAME

cacosl — complex arc cosine functions

SYNOPSIS

```
#include <complex.h>

long double complex cacosl(long double complex z);
```

DESCRIPTION

Refer to *cacos*( ).

NAME

calloc — a memory allocator

SYNOPSIS

```
#include <stdlib.h>

void *calloc(size_t nelem, size_t elsize);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *calloc*( ) function shall allocate unused space for an array of *nelem* elements each of whose size in bytes is *elsize*. The space shall be initialized to all bits 0.

The order and contiguity of storage allocated by successive calls to *calloc*( ) is unspecified. The pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to a pointer to any type of object and then used to access such an object or an array of such objects in the space allocated (until the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object disjoint from any other object. The pointer returned shall point to the start (lowest byte address) of the allocated space. If the space cannot be allocated, a null pointer shall be returned. If the size of the space requested is 0, the behavior is implementation-defined: the value returned shall be either a null pointer or a unique pointer.

RETURN VALUE

Upon successful completion with both *nelem* and *elsize* non-zero, *calloc*( ) shall return a pointer to the allocated space. If either *nelem* or *elsize* is 0, then either a null pointer or a unique pointer value that can be successfully passed to *free*( ) shall be returned. Otherwise, it shall return a null CX pointer and set *errno* to indicate the error.

ERRORS

The *calloc*( ) function shall fail if:

CX [ENOMEM] Insufficient memory is available.

EXAMPLES

None.

APPLICATION USAGE

There is now no requirement for the implementation to support the inclusion of **<malloc.h>**.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

```
#include <nl_types.h>

int catclose(nl_catd catd);
```

DESCRIPTION

The *catclose*( ) function shall close the message catalog identified by *catd*. If a file descriptor is used to implement the type **nl_catd**, that file descriptor shall be closed.

RETURN VALUE

Upon successful completion, *catclose*( ) shall return 0; otherwise, −1 shall be returned, and *errno* set to indicate the error.

ERRORS

The *catclose*( ) function may fail if:

[EBADF]	The catalog descriptor is not valid.
[EINTR]	The *catclose*( ) function was interrupted by a signal.

NAME

catgets — read a program message

SYNOPSIS

XSI

```
#include <nl_types.h>

char *catgets(nl_catd catd, int set_id, int msg_id, const char *s);
```

DESCRIPTION

The *catgets*( ) function shall attempt to read message *msg_id*, in set *set_id*, from the message catalog identified by *catd*. The *catd* argument is a message catalog descriptor returned from an earlier call to *catopen*( ). The *s* argument points to a default message string which shall be returned by *catgets*( ) if it cannot retrieve the identified message. |

The *catgets*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

If the identified message is retrieved successfully, *catgets*( ) shall return a pointer to an internal buffer area containing the null-terminated message string. If the call is unsuccessful for any reason, *s* shall be returned and *errno* may be set to indicate the error.

ERRORS

The *catgets*( ) function may fail if:

[EBADF]	The *catd* argument is not a valid message catalog descriptor open for reading.
[EBADMSG]	The message identified by *set_id* and *msg_id* in the specified message catalog did not satisfy implementation-defined security criteria.
[EINTR]	The read operation was terminated due to the receipt of a signal, and no data was transferred.
[EINVAL]	The message catalog identified by *catd* is corrupted.
[ENOMSG]	The message identified by *set_id* and *msg_id* is not in the message catalog.

EXAMPLES

None.

APPLICATION USAGE

None.

catclose( ), *catopen*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<nl_types.h>**

CHANGE HISTORY

First released in Issue 2.

Issue 5

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

NAME

catopen — open a message catalog

SYNOPSIS

XSI

```
#include <nl_types.h>

nl_catd catopen(const char *name, int oflag);
```

DESCRIPTION

The *catopen*( ) function shall open a message catalog and return a message catalog descriptor. The *name* argument specifies the name of the message catalog to be opened. If *name* contains a `'/'`, then *name* specifies a complete name for the message catalog. Otherwise, the environment variable *NLSPATH* is used with *name* substituted for the `%N` conversion specification (see the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 8, Environment Variables). If *NLSPATH* exists in the environment when the process starts, then if the process has appropriate privileges, the behavior of *catopen*( ) is undefined. If *NLSPATH* does not exist in the environment, or if a message catalog cannot be found in any of the components specified by *NLSPATH*, then an implementation-defined default path shall be used. This default may be affected by the setting of *LC_MESSAGES* if the value of *oflag* is NL_CAT_LOCALE, or the *LANG* environment variable if *oflag* is 0. |

A message catalog descriptor shall remain valid in a process until that process closes it, or a successful call to one of the *exec* functions. A change in the setting of the *LC_MESSAGES* category may invalidate existing open catalogs. |

If a file descriptor is used to implement message catalog descriptors, the FD_CLOEXEC flag shall be set; see **<fcntl.h>**.

If the value of the *oflag* argument is 0, the *LANG* environment variable is used to locate the catalog without regard to the *LC_MESSAGES* category. If the *oflag* argument is NL_CAT_LOCALE, the *LC_MESSAGES* category is used to locate the message catalog (see the Base Definitions volume of IEEE Std 1003.1-200x, Section 8.2, Internationalization Variables).

RETURN VALUE

Upon successful completion, *catopen*( ) shall return a message catalog descriptor for use on subsequent calls to *catgets*( ) and *catclose*( ). Otherwise, *catopen*( ) shall return (**nl_catd**) −1 and set *errno* to indicate the error.

ERRORS

The *catopen*( ) function may fail if:

[EACCES]	Search permission is denied for the component of the path prefix of the message catalog or read permission is denied for the message catalog.
[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
[ENAMETOOLONG]	The length of a pathname of the message catalog exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}. |
[ENAMETOOLONG]	Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}. |
[ENFILE]	Too many files are currently open in the system.
[ENOENT]	The message catalog does not exist or the *name* argument points to an empty string.

[ENOMEM]	Insufficient storage space is available.
[ENOTDIR]	A component of the path prefix of the message catalog is not a directory.

EXAMPLES

None.

APPLICATION USAGE

Some implementations of *catopen*( ) use *malloc*( ) to allocate space for internal buffer areas. The *catopen*( ) function may fail if there is insufficient storage space available to accommodate these buffers.

Conforming applications must assume that message catalog descriptors are not valid after a call to one of the *exec* functions. |

Application writers should be aware that guidelines for the location of message catalogs have not yet been developed. Therefore they should take care to avoid conflicting with catalogs used by other applications and the standard utilities.

NAME

cbrt, cbrtf, cbrtl — cube root functions

SYNOPSIS

```
#include <math.h>

double cbrt(double x);
float cbrtf(float x);
long double cbrtl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the real cube root of their argument *x*.

RETURN VALUE

Upon successful completion, these functions shall return the cube root of *x*.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, or ±Inf, *x* shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

For some applications, a true cube root function, which returns negative results for negative arguments, is more appropriate than *pow*(*x*, 1.0 / 3.0), which returns a NaN for *x* less than 0.

FUTURE DIRECTIONS

None.

NAME

ccosl — complex cosine functions

SYNOPSIS

```
#include <complex.h>

long double complex ccosl(long double complex z);
```

DESCRIPTION

Refer to *ccos*( ).

NAME

ceil, ceilf, ceill — ceiling value function

SYNOPSIS

```
#include <math.h>

double ceil(double x);
float ceilf(float x);
long double ceill(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the smallest integral value not less than *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, *ceil*( ), *ceilf*( ), and *ceill*( ) shall return the smallest integral value not less than *x*, expressed as a type **double**, **float**, or **long double**, respectively.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, or ±Inf, *x* shall be returned.

XSI If the correct value would cause overflow, a range error shall occur and *ceil*( ), *ceilf*( ), and *ceill*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

ERRORS

These functions shall fail if:

XSI Range Error The result overflows.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

The integral value returned by these functions need not be expressible as an **int** or **long**. The return value should be tested before assigning it to an integer type to avoid the undefined results of an integer overflow.

The *ceil*( ) function can only overflow when the floating-point representation has DBL_MANT_DIG > DBL_MAX_EXP.

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

cfgetispeed — get input baud rate

SYNOPSIS

```
#include <termios.h>

speed_t cfgetispeed(const struct termios *termios_p);
```

DESCRIPTION

The *cfgetispeed*( ) function shall extract the input baud rate from the **termios** structure to which the *termios_p* argument points.

This function shall return exactly the value in the **termios** data structure, without interpretation.

RETURN VALUE

Upon successful completion, *cfgetispeed*( ) shall return a value of type **speed_t** representing the input baud rate.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The term *baud* is used historically here, but is not technically correct. This is properly ''bits per second'', which may not be the same as baud. However, the term is used because of the historical usage and understanding.

The *cfgetospeed*( ), *cfgetispeed*( ), *cfsetospeed*( ), and *cfsetispeed*( ) functions do not take arguments as numbers, but rather as symbolic names. There are two reasons for this:

1. Historically, numbers were not used because of the way the rate was stored in the data structure. This is retained even though a function is now used.
2. More importantly, only a limited set of possible rates is at all portable, and this constrains the application to that set.

There is nothing to prevent an implementation to accept, as an extension, a number (such as 126) if it wished, and because the encoding of the Bxxx symbols is not specified, this can be done so no ambiguity is introduced.

Setting the input baud rate to zero was a mechanism to allow for split baud rates. Clarifications in this volume of IEEE Std 1003.1-200x have made it possible to determine whether split rates are supported and to support them without having to treat zero as a special case. Since this functionality is also confusing, it has been declared obsolescent. The 0 argument referred to is the literal constant 0, not the symbolic constant B0. This volume of IEEE Std 1003.1-200x does not preclude B0 from being defined as the value 0; in fact, implementations would likely benefit from the two being equivalent. This volume of IEEE Std 1003.1-200x does not fully specify whether the previous *cfsetispeed*( ) value is retained after a *tcgetattr*( ) as the actual value or as zero. Therefore, conforming applications should always set both the input speed and output speed when setting either. |

In historical implementations, the baud rate information is traditionally kept in **c_cflag**. Applications should be written to presume that this might be the case (and thus not blindly copy **c_cflag**), but not to rely on it in case it is in some other field of the structure. Setting the **c_cflag** field absolutely after setting a baud rate is a non-portable action because of this. In general, the unused parts of the flag fields might be used by the implementation and should not be blindly copied from the descriptions of one terminal device to another.

FUTURE DIRECTIONS

None.

NAME

cfsetispeed — set input baud rate

SYNOPSIS

```
#include <termios.h>

int cfsetispeed(struct termios *termios_p, speed_t speed);
```

DESCRIPTION

The *cfsetispeed*( ) function shall set the input baud rate stored in the structure pointed to by *termios_p* to *speed*.

There shall be no effect on the baud rates set in the hardware until a subsequent successful call to *tcsetattr*( ) with the same **termios** structure. Similarly, errors resulting from attempts to set baud rates not supported by the terminal device need not be detected until the *tcsetattr*( ) function is called.

RETURN VALUE

Upon successful completion, *cfsetispeed*( ) shall return 0; otherwise, −1 shall be returned, and *errno* may be set to indicate the error.

ERRORS

The *cfsetispeed*( ) function may fail if:

[EINVAL]	The *speed* value is not a valid baud rate.
[EINVAL]	The value of *speed* is outside the range of possible speed values as specified in **<termios.h>**.

EXAMPLES

None.

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 3.

Entry included for alignment with the POSIX.1-1988 standard.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The optional setting of *errno* and the [EINVAL] error conditions are added.

NAME

cfsetospeed — set output baud rate

SYNOPSIS

```
#include <termios.h>

int cfsetospeed(struct termios *termios_p, speed_t speed);
```

DESCRIPTION

The *cfsetospeed*( ) function shall set the output baud rate stored in the structure pointed to by *termios_p* to *speed*.

There shall be no effect on the baud rates set in the hardware until a subsequent successful call to *tcsetattr*( ) with the same **termios** structure. Similarly, errors resulting from attempts to set baud rates not supported by the terminal device need not be detected until the *tcsetattr*( ) function is called.

RETURN VALUE

Upon successful completion, *cfsetospeed*( ) shall return 0; otherwise, it shall return −1 and *errno* may be set to indicate the error.

ERRORS

The *cfsetospeed*( ) function may fail if:

[EINVAL]	The *speed* value is not a valid baud rate.
[EINVAL]	The value of *speed* is outside the range of possible speed values as specified in **<termios.h>**.

CHANGE HISTORY

First released in Issue 3.

Entry included for alignment with the POSIX.1-1988 standard.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The optional setting of *errno* and the [EINVAL] error conditions are added.

NAME

chdir — change working directory

SYNOPSIS

```
#include <unistd.h>

int chdir(const char *path);
```

DESCRIPTION

The *chdir*( ) function shall cause the directory named by the pathname pointed to by the *path* argument to become the current working directory; that is, the starting point for path searches for pathnames not beginning with `'/'`.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned, the current working directory shall remain unchanged, and *errno* shall be set to indicate the error.

ERRORS

The *chdir*( ) function shall fail if:

[EACCES]	Search permission is denied for any component of the pathname.
[ELOOP]	A loop exists in symbolic links encountered during resolution of the *path* argument.
[ENAMETOOLONG]	The length of the *path* argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
[ENOENT]	A component of *path* does not name an existing directory or *path* is an empty string.
[ENOTDIR]	A component of the pathname is not a directory.

The *chdir*( ) function may fail if:

[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.
[ENAMETOOLONG]	As a result of encountering a symbolic link in resolution of the *path* argument, the length of the substituted pathname string exceeded {PATH_MAX}.

EXAMPLES

Changing the Current Working Directory

The following example makes the value pointed to by **directory**, **/tmp**, the current working directory.

```
#include <unistd.h>
...
char *directory = "/tmp";
int ret;

ret = chdir (directory);
```

APPLICATION USAGE

None.

RATIONALE

The *chdir*( ) function only affects the working directory of the current process.

FUTURE DIRECTIONS

None.

SEE ALSO

getcwd( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The APPLICATION USAGE section is added.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification: |

- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

NAME

chmod — change mode of a file

SYNOPSIS

```
#include <sys/stat.h>

int chmod(const char *path, mode_t mode);
```

DESCRIPTION

XSI The *chmod*( ) function shall change S_ISUID, S_ISGID, S_ISVTX, and the file permission bits of the file named by the pathname pointed to by the *path* argument to the corresponding bits in the *mode* argument. The application shall ensure that the effective user ID of the process matches the owner of the file or the process has appropriate privileges in order to do this.

XSI S_ISUID, S_ISGID, S_ISVTX, and the file permission bits are described in **<sys/stat.h>**.

If the calling process does not have appropriate privileges, and if the group ID of the file does not match the effective group ID or one of the supplementary group IDs and if the file is a regular file, bit S_ISGID (set-group-ID on execution) in the file's mode shall be cleared upon successful return from *chmod*( ).

Additional implementation-defined restrictions may cause the S_ISUID and S_ISGID bits in *mode* to be ignored.

The effect on file descriptors for files open at the time of a call to *chmod*( ) is implementation-defined.

Upon successful completion, *chmod*( ) shall mark for update the *st_ctime* field of the file.

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, −1 shall be returned and *errno* set to indicate the error. If −1 is returned, no change to the file mode occurs.

ERRORS

The *chmod*( ) function shall fail if:

[EACCES]	Search permission is denied on a component of the path prefix.
[ELOOP]	A loop exists in symbolic links encountered during resolution of the *path* argument.
[ENAMETOOLONG]	The length of the *path* argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
[ENOTDIR]	A component of the path prefix is not a directory.
[ENOENT]	A component of *path* does not name an existing file or *path* is an empty string.
[EPERM]	The effective user ID does not match the owner of the file and the process does not have appropriate privileges.
[EROFS]	The named file resides on a read-only file system.

The *chmod*( ) function may fail if:

[EINTR]	A signal was caught during execution of the function.
[EINVAL]	The value of the *mode* argument is invalid.
[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
As a result of encountering a symbolic link in resolution of the *path* argument, the length of the substituted pathname strings exceeded {PATH_MAX}.

EXAMPLES

Setting Read Permissions for User, Group, and Others

The following example sets read permissions for the owner, group, and others.

```
#include <sys/stat.h>

const char *path;
...
chmod(path, S_IRUSR|S_IRGRP|S_IROTH);
```

Setting Read, Write, and Execute Permissions for the Owner Only

The following example sets read, write, and execute permissions for the owner, and no permissions for group and others.

```
#include <sys/stat.h>

const char *path;
...
chmod(path, S_IRWXU);
```

Setting Different Permissions for Owner, Group, and Other

The following example sets owner permissions for CHANGEFILE to read, write, and execute, group permissions to read and execute, and other permissions to read.

```
#include <sys/stat.h>

#define CHANGEFILE "/etc/myfile"
...
chmod(CHANGEFILE, S_IRWXU|S_IRGRP|S_IXGRP|S_IROTH);
```

Setting and Checking File Permissions

The following example sets the file permission bits for a file named **/home/cnd/mod1**, then calls the *stat*( ) function to verify the permissions.

```
#include <sys/types.h>
#include <sys/stat.h>

int status;
struct stat buffer
...
chmod("home/cnd/mod1", S_IRWXU|S_IRWXG|S_IROTH|S_IWOTH);
status = stat("home/cnd/mod1", &buffer;);
```

APPLICATION USAGE

In order to ensure that the S_ISUID and S_ISGID bits are set, an application requiring this should use *stat*( ) after a successful *chmod*( ) to verify this.

Any file descriptors currently open by any process on the file could possibly become invalid if the mode of the file is changed to a value which would deny access to that process. One situation where this could occur is on a stateless file system. This behavior will not occur in a conforming environment.

RATIONALE

This volume of IEEE Std 1003.1-200x specifies that the S_ISGID bit is cleared by *chmod*( ) on a regular file under certain conditions. This is specified on the assumption that regular files may be executed, and the system should prevent users from making executable *setgid*( ) files perform with privileges that the caller does not have. On implementations that support execution of other file types, the S_ISGID bit should be cleared for those file types under the same circumstances.

Implementations that use the S_ISUID bit to indicate some other function (for example, mandatory record locking) on non-executable files need not clear this bit on writing. They should clear the bit for executable files and any other cases where the bit grants special powers to processes that change the file contents. Similar comments apply to the S_ISGID bit.

FUTURE DIRECTIONS

None.

chown( ), *mkdir*( ), *mkfifo*( ), *open*( ), *stat*( ), *statvfs*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/stat.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification: |

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EINVAL] and [EINTR] optional error conditions are added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

NAME

chown — change owner and group of a file

SYNOPSIS

```
#include <unistd.h>

int chown(const char *path, uid_t owner, gid_t group);
```

DESCRIPTION

The *chown*( ) function shall change the user and group ownership of a file.

The *path* argument points to a pathname naming a file. The user ID and group ID of the named file shall be set to the numeric values contained in *owner* and *group*, respectively.

Only processes with an effective user ID equal to the user ID of the file or with appropriate privileges may change the ownership of a file. If _POSIX_CHOWN_RESTRICTED is in effect for *path*:

- Changing the user ID is restricted to processes with appropriate privileges.
- Changing the group ID is permitted to a process with an effective user ID equal to the user ID of the file, but without appropriate privileges, if and only if *owner* is equal to the file's user ID or (**uid_t**)–1 and *group* is equal either to the calling process' effective group ID or to one of its supplementary group IDs.

If the specified file is a regular file, one or more of the S_IXUSR, S_IXGRP, or S_IXOTH bits of the file mode are set, and the process does not have appropriate privileges, the set-user-ID (S_ISUID) and set-group-ID (S_ISGID) bits of the file mode shall be cleared upon successful return from *chown*( ). If the specified file is a regular file, one or more of the S_IXUSR, S_IXGRP, or S_IXOTH bits of the file mode are set, and the process has appropriate privileges, it is implementation-defined whether the set-user-ID and set-group-ID bits are altered. If the *chown*( ) function is successfully invoked on a file that is not a regular file and one or more of the S_IXUSR, S_IXGRP, or S_IXOTH bits of the file mode are set, the set-user-ID and set-group-ID bits may be cleared.

If *owner* or *group* is specified as (**uid_t**)–1 or (**gid_t**)–1, respectively, the corresponding ID of the file shall not be changed. If both owner and group are –1, the times need not be updated.

Upon successful completion, *chown*( ) shall mark for update the *st_ctime* field of the file.

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, –1 shall be returned and *errno* set to indicate the error. If –1 is returned, no changes are made in the user ID and group ID of the file.

ERRORS

The *chown*( ) function shall fail if:

[EACCES]	Search permission is denied on a component of the path prefix.
[ELOOP]	A loop exists in symbolic links encountered during resolution of the *path* argument.
[ENAMETOOLONG]	The length of the *path* argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
[ENOTDIR]	A component of the path prefix is not a directory.
[ENOENT]	A component of *path* does not name an existing file or *path* is an empty string.

[EPERM]	The effective user ID does not match the owner of the file, or the calling process does not have appropriate privileges and _POSIX_CHOWN_RESTRICTED indicates that such privilege is required.
[EROFS]	The named file resides on a read-only file system.

The *chown*( ) function may fail if:

[EIO]	An I/O error occurred while reading or writing to the file system.
[EINTR]	The *chown*( ) function was interrupted by a signal which was caught.
[EINVAL]	The owner or group ID supplied is not a value supported by the implementation.
[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.
[ENAMETOOLONG]	As a result of encountering a symbolic link in resolution of the *path* argument, the length of the substituted pathname string exceeded {PATH_MAX}.

EXAMPLES

None.

APPLICATION USAGE

Although *chown*( ) can be used on some implementations by the file owner to change the owner and group to any desired values, the only portable use of this function is to change the group of a file to the effective GID of the calling process or to a member of its group set.

RATIONALE

System III and System V allow a user to give away files; that is, the owner of a file may change its user ID to anything. This is a serious problem for implementations that are intended to meet government security regulations. Version 7 and 4.3 BSD permit only the superuser to change the user ID of a file. Some government agencies (usually not ones concerned directly with security) find this limitation too confining. This volume of IEEE Std 1003.1-200x uses *may* to permit secure implementations while not disallowing System V.

System III and System V allow the owner of a file to change the group ID to anything. Version 7 permits only the superuser to change the group ID of a file. 4.3 BSD permits the owner to change the group ID of a file to its effective group ID or to any of the groups in the list of supplementary group IDs, but to no others.

The POSIX.1-1990 standard requires that the *chown*( ) function invoked by a non-appropriate privileged process clear the S_ISGID and the S_ISUID bits for regular files, and permits them to be cleared for other types of files. This is so that changes in accessibility do not accidentally cause files to become security holes. Unfortunately, requiring these bits to be cleared on non-executable data files also clears the mandatory file locking bit (shared with S_ISGID), which is an extension on many implementations (it first appeared in System V). These bits should only be required to be cleared on regular files that have one or more of their execute bits set.

FUTURE DIRECTIONS

None.

SEE ALSO

chmod( ), *pathconf*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The wording describing the optional dependency on _POSIX_CHOWN_RESTRICTED is restored.
- The [EPERM] error is restored as an error dependent on _POSIX_CHOWN_RESTRICTED. This is since its operand is a pathname and applications should be aware that the error may not occur for that pathname if the file system does not support _POSIX_CHOWN_RESTRICTED.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The value for *owner* of (**uid_t**)–1 allows the use of –1 by the owner of a file to change the group ID only. A corresponding change is made for group.
- The [ELOOP] mandatory error condition is added.
- The [EIO] and [EINTR] optional error conditions are added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that the S_ISUID and S_ISGID bits do not need to be cleared when the process has appropriate privileges.
- The [ELOOP] optional error condition is added.

NAME

cimag, cimagf, cimagl — complex imaginary functions

SYNOPSIS

```
#include <complex.h>

double cimag(double complex z);
float cimagf(float complex z);
long double cimagl(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the imaginary part of *z*.

RETURN VALUE

These functions shall return the imaginary part value (as a real).

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

For a variable *z* of complex type:

```
z == creal(z) + cimag(z)*I
```

NAME

clock — report CPU time used

SYNOPSIS

```
#include <time.h>

clock_t clock(void);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *clock*( ) function shall return the implementation's best approximation to the processor time used by the process since the beginning of an implementation-defined era related only to the process invocation.

RETURN VALUE

To determine the time in seconds, the value returned by *clock*( ) should be divided by the value of the macro CLOCKS_PER_SEC. XSI CLOCKS_PER_SEC is defined to be one million in **<time.h>**. If the processor time used is not available or its value cannot be represented, the function shall return the value (**clock_t**)–1.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

In order to measure the time spent in a program, *clock*( ) should be called at the start of the program and its return value subtracted from the value returned by subsequent calls. The value returned by *clock*( ) is defined for compatibility across systems that have clocks with different resolutions. The resolution on any particular system need not be to microsecond accuracy.

The value returned by *clock*( ) may wrap around on some implementations. For example, on a machine with 32-bit values for **clock_t**, it wraps after 2 147 seconds or 36 minutes.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

clock_getcpuclockid — access a process CPU-time clock (**ADVANCED REALTIME**)

SYNOPSIS

CPT
```
#include <time.h>

int clock_getcpuclockid(pid_t pid, clockid_t *clock_id);
```

DESCRIPTION

The *clock_getcpuclockid*( ) function shall return the clock ID of the CPU-time clock of the process specified by *pid*. If the process described by *pid* exists and the calling process has permission, the clock ID of this clock shall be returned in *clock_id*.

If *pid* is zero, the *clock_getcpuclockid*( ) function shall return the clock ID of the CPU-time clock of the process making the call, in *clock_id*.

The conditions under which one process has permission to obtain the CPU-time clock ID of other processes are implementation-defined.

RETURN VALUE

Upon successful completion, *clock_getcpuclockid*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *clock_getcpuclockid*( ) function shall fail if:

[EPERM]	The requesting process does not have permission to access the CPU-time clock for the process.

The *clock_getcpuclockid*( ) function may fail if:

[ESRCH]	No process can be found corresponding to the process specified by *pid*.

EXAMPLES

None.

APPLICATION USAGE

The *clock_getcpuclockid*( ) function is part of the Process CPU-Time Clocks option and need not be provided on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

clock_getres( ), *timer_create*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<time.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

NAME

clock_getres, clock_gettime, clock_settime — clock and timer functions (**REALTIME**)

SYNOPSIS

TMR

```
#include <time.h>

int clock_getres(clockid_t clock_id, struct timespec *res);
int clock_gettime(clockid_t clock_id, struct timespec *tp);
int clock_settime(clockid_t clock_id, const struct timespec *tp);
```

DESCRIPTION

The *clock_getres*( ) function shall return the resolution of any clock. Clock resolutions are implementation-defined and cannot be set by a process. If the argument *res* is not NULL, the resolution of the specified clock shall be stored in the location pointed to by *res*. If *res* is NULL, the clock resolution is not returned. If the *time* argument of *clock_settime*( ) is not a multiple of *res*, then the value is truncated to a multiple of *res*.

The *clock_gettime*( ) function shall return the current value *tp* for the specified clock, *clock_id*.

The *clock_settime*( ) function shall set the specified clock, *clock_id*, to the value specified by *tp*. Time values that are between two consecutive non-negative integer multiples of the resolution of the specified clock shall be truncated down to the smaller multiple of the resolution.

A clock may be system-wide (that is, visible to all processes) or per-process (measuring time that is meaningful only within a process). All implementations shall support a *clock_id* of CLOCK_REALTIME as defined in **<time.h>**. This clock represents the realtime clock for the system. For this clock, the values returned by *clock_gettime*( ) and specified by *clock_settime*( ) represent the amount of time (in seconds and nanoseconds) since the Epoch. An implementation may also support additional clocks. The interpretation of time values for these clocks is unspecified.

If the value of the CLOCK_REALTIME clock is set via *clock_settime*( ), the new value of the clock shall be used to determine the time of expiration for absolute time services based upon the CLOCK_REALTIME clock. This applies to the time at which armed absolute timers expire. If the absolute time requested at the invocation of such a time service is before the new value of the clock, the time service shall expire immediately as if the clock had reached the requested time normally.

Setting the value of the CLOCK_REALTIME clock via *clock_settime*( ) shall have no effect on threads that are blocked waiting for a relative time service based upon this clock, including the *nanosleep*( ) function; nor on the expiration of relative timers based upon this clock. Consequently, these time services shall expire when the requested relative interval elapses, independently of the new or old value of the clock.

MON If the Monotonic Clock option is supported, all implementations shall support a *clock_id* of CLOCK_MONOTONIC defined in **<time.h>**. This clock represents the monotonic clock for the system. For this clock, the value returned by *clock_gettime*( ) represents the amount of time (in seconds and nanoseconds) since an unspecified point in the past (for example, system start-up time, or the Epoch). This point does not change after system start-up time. The value of the CLOCK_MONOTONIC clock cannot be set via *clock_settime*( ). This function shall fail if it is invoked with a *clock_id* argument of CLOCK_MONOTONIC.

The effect of setting a clock via *clock_settime*( ) on armed per-process timers associated with a clock other than CLOCK_REALTIME is implementation-defined.

CS If the value of the CLOCK_REALTIME clock is set via *clock_settime*( ), the new value of the clock shall be used to determine the time at which the system shall awaken a thread blocked on an absolute *clock_nanosleep*( ) call based upon the CLOCK_REALTIME clock. If the absolute time requested at the invocation of such a time service is before the new value of the clock, the call shall return immediately as if the clock had reached the requested time normally.

Setting the value of the CLOCK_REALTIME clock via *clock_settime*( ) shall have no effect on any thread that is blocked on a relative *clock_nanosleep*( ) call. Consequently, the call shall return when the requested relative interval elapses, independently of the new or old value of the clock.

The appropriate privilege to set a particular clock is implementation-defined.

CPT If _POSIX_CPUTIME is defined, implementations shall support clock ID values obtained by invoking *clock_getcpuclockid*( ), which represent the CPU-time clock of a given process. Implementations shall also support the special **clockid_t** value CLOCK_PROCESS_CPUTIME_ID, which represents the CPU-time clock of the calling process when invoking one of the *clock_**( ) or *timer_**( ) functions. For these clock IDs, the values returned by *clock_gettime*( ) and specified by *clock_settime*( ) represent the amount of execution time of the process associated with the clock. Changing the value of a CPU-time clock via *clock_settime*( ) shall have no effect on the behavior of the sporadic server scheduling policy (see **Scheduling Policies** (on page 494)).

TCT If _POSIX_THREAD_CPUTIME is defined, implementations shall support clock ID values obtained by invoking *pthread_getcpuclockid*( ), which represent the CPU-time clock of a given thread. Implementations shall also support the special **clockid_t** value CLOCK_THREAD_CPUTIME_ID, which represents the CPU-time clock of the calling thread when invoking one of the *clock_**( ) or *timer_**( ) functions. For these clock IDs, the values returned by *clock_gettime*( ) and specified by *clock_settime*( ) shall represent the amount of | execution time of the thread associated with the clock. Changing the value of a CPU-time clock | via *clock_settime*( ) shall have no effect on the behavior of the sporadic server scheduling policy | (see **Scheduling Policies** (on page 494)).

RETURN VALUE

A return value of 0 shall indicate that the call succeeded. A return value of −1 shall indicate that an error occurred, and *errno* shall be set to indicate the error.

ERRORS

The *clock_getres*( ), *clock_gettime*( ), and *clock_settime*( ) functions shall fail if:

[EINVAL] The *clock_id* argument does not specify a known clock.

The *clock_settime*( ) function shall fail if:

[EINVAL] The *tp* argument to *clock_settime*( ) is outside the range for the given clock ID.

[EINVAL] The *tp* argument specified a nanosecond value less than zero or greater than or equal to 1 000 million.

MON [EINVAL] The value of the *clock_id* argument is CLOCK_MONOTONIC.

The *clock_settime*( ) function may fail if:

[EPERM] The requesting process does not have the appropriate privilege to set the specified clock.

EXAMPLES

None.

APPLICATION USAGE

These functions are part of the Timers option and need not be available on all implementations.

Note that the absolute value of the monotonic clock is meaningless (because its origin is arbitrary), and thus there is no need to set it. Furthermore, realtime applications can rely on the fact that the value of this clock is never set and, therefore, that time intervals measured with this clock will not be affected by calls to *clock_settime*( ).

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

clock_getcpuclockid( ), *clock_nanosleep*( ), *ctime*( ), *mq_timedreceive*( ), *mq_timedsend*( ), *nanosleep*( ), *pthread_mutex_timedlock*( ), *sem_timedwait*( ), *time*( ), *timer_create*( ), *timer_getoverrun*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<time.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

The APPLICATION USAGE section is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added of the effect of resetting the clock resolution.

CPU-time clocks and the *clock_getcpuclockid*( ) function are added for alignment with IEEE Std 1003.1d-1999.

The following changes are added for alignment with IEEE Std 1003.1j-2000:

- The DESCRIPTION is updated as follows:
  - The value returned by *clock_gettime*( ) for CLOCK_MONOTONIC is specified.
  - *clock_settime*( ) failing for CLOCK_MONOTONIC is specified.
  - The effects of *clock_settime*( ) on the *clock_nanosleep*( ) function with respect to CLOCK_REALTIME is specified.
- An [EINVAL] error is added to the ERRORS section, indicating that *clock_settime*( ) fails for CLOCK_MONOTONIC.
- The APPLICATION USAGE section notes that the CLOCK_MONOTONIC clock need not and shall not be set by *clock_settime*( ) since the absolute value of the CLOCK_MONOTONIC clock is meaningless.
- The *clock_nanosleep*( ), *mq_timedreceive*( ), *mq_timedsend*( ), *pthread_mutex_timedlock*( ), *sem_timedwait*( ), *timer_create*( ), and *timer_settime*( ) functions are added to the SEE ALSO section.

NAME

clock_nanosleep — high resolution sleep with specifiable clock (**ADVANCED REALTIME**)

SYNOPSIS

CS

```
#include <time.h>
```

```
int clock_nanosleep(clockid_t clock_id, int flags,
    const struct timespec *rqtp, struct timespec *rmtp);
```

DESCRIPTION

If the flag TIMER_ABSTIME is not set in the *flags* argument, the *clock_nanosleep*( ) function shall cause the current thread to be suspended from execution until either the time interval specified by the *rqtp* argument has elapsed, or a signal is delivered to the calling thread and its action is to invoke a signal-catching function, or the process is terminated. The clock used to measure the time shall be the clock specified by *clock_id*.

If the flag TIMER_ABSTIME is set in the *flags* argument, the *clock_nanosleep*( ) function shall cause the current thread to be suspended from execution until either the time value of the clock specified by *clock_id* reaches the absolute time specified by the *rqtp* argument, or a signal is delivered to the calling thread and its action is to invoke a signal-catching function, or the process is terminated. If, at the time of the call, the time value specified by *rqtp* is less than or equal to the time value of the specified clock, then *clock_nanosleep*( ) shall return immediately and the calling process shall not be suspended.

The suspension time caused by this function may be longer than requested because the argument value is rounded up to an integer multiple of the sleep resolution, or because of the scheduling of other activity by the system. But, except for the case of being interrupted by a signal, the suspension time for the relative *clock_nanosleep*( ) function (that is, with the TIMER_ABSTIME flag not set) shall not be less than the time interval specified by *rqtp*, as measured by the corresponding clock. The suspension for the absolute *clock_nanosleep*( ) function (that is, with the TIMER_ABSTIME flag set) shall be in effect at least until the value of the corresponding clock reaches the absolute time specified by *rqtp*, except for the case of being interrupted by a signal.

The use of the *clock_nanosleep*( ) function shall have no effect on the action or blockage of any signal.

The *clock_nanosleep*( ) function shall fail if the *clock_id* argument refers to the CPU-time clock of the calling thread. It is unspecified if *clock_id* values of other CPU-time clocks are allowed.

RETURN VALUE

If the *clock_nanosleep*( ) function returns because the requested time has elapsed, its return value shall be zero.

If the *clock_nanosleep*( ) function returns because it has been interrupted by a signal, it shall return the corresponding error value. For the relative *clock_nanosleep*( ) function, if the *rmtp* argument is non-NULL, the **timespec** structure referenced by it shall be updated to contain the amount of time remaining in the interval (the requested time minus the time actually slept). If the *rmtp* argument is NULL, the remaining time is not returned. The absolute *clock_nanosleep*( ) function has no effect on the structure referenced by *rmtp*.

If *clock_nanosleep*( ) fails, it shall return the corresponding error value.

ERRORS

The *clock_nanosleep*( ) function shall fail if:

[EINTR]	The *clock_nanosleep*( ) function was interrupted by a signal.
[EINVAL]	The *rqtp* argument specified a nanosecond value less than zero or greater than or equal to 1 000 million; or the TIMER_ABSTIME flag was specified in flags and the *rqtp* argument is outside the range for the clock specified by *clock_id*; or the *clock_id* argument does not specify a known clock, or specifies the CPU-time clock of the calling thread.
[ENOTSUP]	The *clock_id* argument specifies a clock for which *clock_nanosleep*( ) is not supported, such as a CPU-time clock.

EXAMPLES

None.

APPLICATION USAGE

Calling *clock_nanosleep*( ) with the value TIMER_ABSTIME not set in the *flags* argument and with a *clock_id* of CLOCK_REALTIME is equivalent to calling *nanosleep*( ) with the same *rqtp* and *rmtp* arguments.

RATIONALE

The *nanosleep*( ) function specifies that the system-wide clock CLOCK_REALTIME is used to measure the elapsed time for this time service. However, with the introduction of the monotonic clock CLOCK_MONOTONIC a new relative sleep function is needed to allow an application to take advantage of the special characteristics of this clock.

There are many applications in which a process needs to be suspended and then activated multiple times in a periodic way; for example, to poll the status of a non-interrupting device or to refresh a display device. For these cases, it is known that precise periodic activation cannot be achieved with a relative *sleep*( ) or *nanosleep*( ) function call. Suppose, for example, a periodic process that is activated at time $T0$, executes for a while, and then wants to suspend itself until time $T0+T$, the period being T. If this process wants to use the *nanosleep*( ) function, it must first call *clock_gettime*( ) to get the current time, then calculate the difference between the current time and $T0+T$ and, finally, call *nanosleep*( ) using the computed interval. However, the process could be preempted by a different process between the two function calls, and in this case the interval computed would be wrong; the process would wake up later than desired. This problem would not occur with the absolute *clock_nanosleep*( ) function, since only one function call would be necessary to suspend the process until the desired time. In other cases, however, a relative sleep is needed, and that is why both functionalities are required.

Although it is possible to implement periodic processes using the timers interface, this implementation would require the use of signals, and the reservation of some signal numbers. In this regard, the reasons for including an absolute version of the *clock_nanosleep*( ) function in IEEE Std 1003.1-200x are the same as for the inclusion of the relative *nanosleep*( ).

It is also possible to implement precise periodic processes using *pthread_cond_timedwait*( ), in which an absolute timeout is specified that takes effect if the condition variable involved is never signaled. However, the use of this interface is unnatural, and involves performing other operations on mutexes and condition variables that imply an unnecessary overhead. Furthermore, *pthread_cond_timedwait*( ) is not available in implementations that do not support threads.

Although the interface of the relative and absolute versions of the new high resolution sleep service is the same *clock_nanosleep*( ) function, the *rmtp* argument is only used in the relative sleep. This argument is needed in the relative *clock_nanosleep*( ) function to reissue the function call if it is interrupted by a signal, but it is not needed in the absolute *clock_nanosleep*( ) function call; if the call is interrupted by a signal, the absolute *clock_nanosleep*( ) function can be invoked again with the same *rqtp* argument used in the interrupted call.

FUTURE DIRECTIONS

None.

NAME

clock_settime — clock and timer functions (**REALTIME**)

SYNOPSIS

TMR
```
#include <time.h>

int clock_settime(clockid_t clock_id, const struct timespec *tp);
```

DESCRIPTION

Refer to *clock_getres*( ).

NAME

clog, clogf, clogl — complex natural logarithm functions

SYNOPSIS

```
#include <complex.h>

double complex clog(double complex z);
float complex clogf(float complex z);
long double complex clogl(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the complex natural (base *e*) logarithm of *z*, with a branch cut along the negative real axis.

RETURN VALUE

These functions shall return the complex natural logarithm value, in the range of a strip mathematically unbounded along the real axis and in the interval $[-i\pi, +i\pi]$ along the imaginary axis.

ERRORS

No errors are defined.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

NAME

close — close a file descriptor

SYNOPSIS

```
#include <unistd.h>

int close(int fildes);
```

DESCRIPTION

The *close*( ) function shall deallocate the file descriptor indicated by *fildes*. To deallocate means to make the file descriptor available for return by subsequent calls to *open*( ) or other functions that allocate file descriptors. All outstanding record locks owned by the process on the file associated with the file descriptor shall be removed (that is, unlocked).

If *close*( ) is interrupted by a signal that is to be caught, it shall return −1 with *errno* set to [EINTR] and the state of *fildes* is unspecified. If an I/O error occurred while reading from or writing to the file system during *close*( ), it may return −1 with *errno* set to [EIO]; if this error is returned, the state of *fildes* is unspecified.

When all file descriptors associated with a pipe or FIFO special file are closed, any data remaining in the pipe or FIFO shall be discarded.

When all file descriptors associated with an open file description have been closed the open file description shall be freed.

If the link count of the file is 0, when all file descriptors associated with the file are closed, the space occupied by the file shall be freed and the file shall no longer be accessible.

XSR If a STREAMS-based *fildes* is closed and the calling process was previously registered to receive a SIGPOLL signal for events associated with that STREAM, the calling process shall be unregistered for events associated with the STREAM. The last *close*( ) for a STREAM shall cause the STREAM associated with *fildes* to be dismantled. If O_NONBLOCK is not set and there have been no signals posted for the STREAM, and if there is data on the module's write queue, *close*( ) shall wait for an unspecified time (for each module and driver) for any output to drain before dismantling the STREAM. The time delay can be changed via an I_SETCLTIME *ioctl*( ) request. If the O_NONBLOCK flag is set, or if there are any pending signals, *close*( ) shall not wait for output to drain, and shall dismantle the STREAM immediately.

If the implementation supports STREAMS-based pipes, and *fildes* is associated with one end of a pipe, the last *close*( ) shall cause a hangup to occur on the other end of the pipe. In addition, if the other end of the pipe has been named by *fattach*( ), then the last *close*( ) shall force the named end to be detached by *fdetach*( ). If the named end has no open file descriptors associated with it and gets detached, the STREAM associated with that end shall also be dismantled.

XSI If *fildes* refers to the master side of a pseudo-terminal, and this is the last close, a SIGHUP signal shall be sent to the process group, if any, for which the slave side of the pseudo-terminal is the controlling terminal. It is unspecified whether closing the master side of the pseudo-terminal flushes all queued input and output.

XSR If *fildes* refers to the slave side of a STREAMS-based pseudo-terminal, a zero-length message may be sent to the master.

AIO When there is an outstanding cancelable asynchronous I/O operation against *fildes* when *close*( ) is called, that I/O operation may be canceled. An I/O operation that is not canceled completes as if the *close*( ) operation had not yet occurred. All operations that are not canceled shall complete as if the *close*( ) blocked until the operations completed. The *close*( ) operation itself need not block awaiting such I/O completion. Whether any I/O operation is canceled, and which I/O operation may be canceled upon *close*( ), is implementation-defined.

MF|SHM If a shared memory object or a memory mapped file remains referenced at the last close (that is, a process has it mapped), then the entire contents of the memory object shall persist until the memory object becomes unreferenced. If this is the last close of a shared memory object or a memory mapped file and the close results in the memory object becoming unreferenced, and the memory object has been unlinked, then the memory object shall be removed.

If *fildes* refers to a socket, *close*( ) shall cause the socket to be destroyed. If the socket is in connection-mode, and the SO_LINGER option is set for the socket with non-zero linger time, and the socket has untransmitted data, then *close*( ) shall block for up to the current linger interval until all data is transmitted.

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *close*( ) function shall fail if:

[EBADF]	The *fildes* argument is not a valid file descriptor.
[EINTR]	The *close*( ) function was interrupted by a signal.

The *close*( ) function may fail if:

[EIO]	An I/O error occurred while reading from or writing to the file system.

EXAMPLES

Reassigning a File Descriptor

The following example closes the file descriptor associated with standard output for the current process, re-assigns standard output to a new file descriptor, and closes the original file descriptor to clean up. This example assumes that the file descriptor 0 (which is the descriptor for standard input) is not closed.

```
#include <unistd.h>
...
int pfd;
...
close(1);
dup(pfd);
close(pfd);
...
```

Incidentally, this is exactly what could be achieved using:

```
dup2(pfd, 1);
close(pfd);
```

Closing a File Descriptor

In the following example, *close*( ) is used to close a file descriptor after an unsuccessful attempt is made to associate that file descriptor with a stream.

```
#include <stdio.h>
#include <unistd.h>
#include <stdlib.h>
```

```
#define LOCKFILE "/etc/ptmp"
...
int pfd;
FILE *fpfd;
...
if ((fpfd = fdopen (pfd, "w")) == NULL) {
    close(pfd);
    unlink(LOCKFILE);
    exit(1);
}
...
```

APPLICATION USAGE

An application that had used the *stdio* routine *fopen*( ) to open a file should use the corresponding *fclose*( ) routine rather than *close*( ). Once a file is closed, the file descriptor no longer exists, since the integer corresponding to it no longer refers to a file.

RATIONALE

The use of interruptible device close routines should be discouraged to avoid problems with the implicit closes of file descriptors by *exec* and *exit*( ). This volume of IEEE Std 1003.1-200x only intends to permit such behavior by specifying the [EINTR] error condition.

FUTURE DIRECTIONS

None.

SEE ALSO

fattach( ), *fclose*( ), *fdetach*( ), *fopen*( ), *ioctl*( ), *open*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<unistd.h>**, Section 2.6 (on page 488)

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Issue 6

The DESCRIPTION related to a STREAMS-based file or pseudo-terminal is marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] error condition is added as an optional error.
- The DESCRIPTION is updated to describe the state of the *fildes* file descriptor as unspecified if an I/O error occurs and an [EIO] error condition is returned.

Text referring to sockets is added to the DESCRIPTION.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that shared memory objects and memory mapped files (and not typed memory objects) are the types of memory objects to which the paragraph on last closes applies.

NAME

closedir — close a directory stream

SYNOPSIS

```
#include <dirent.h>

int closedir(DIR *dirp);
```

DESCRIPTION

The *closedir*( ) function shall close the directory stream referred to by the argument *dirp*. Upon return, the value of *dirp* may no longer point to an accessible object of the type **DIR**. If a file descriptor is used to implement type **DIR**, that file descriptor shall be closed.

RETURN VALUE

Upon successful completion, *closedir*( ) shall return 0; otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *closedir*( ) function may fail if:

[EBADF]	The *dirp* argument does not refer to an open directory stream.
[EINTR]	The *closedir*( ) function was interrupted by a signal.

EXAMPLES

Closing a Directory Stream

The following program fragment demonstrates how the *closedir*( ) function is used.

```
...
    DIR *dir;
    struct dirent *dp;
...
    if ((dir = opendir (".")) == NULL) {
...
    }

    while ((dp = readdir (dir)) != NULL) {
...
    }

    closedir(dir);
...
```

APPLICATION USAGE

opendir( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<dirent.h>**

CHANGE HISTORY

First released in Issue 2.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EINTR] error condition is added as an optional error condition.

NAME

closelog, openlog, setlogmask, syslog — control system log

SYNOPSIS

XSI
```
#include <syslog.h>

void closelog(void);
void openlog(const char *ident, int logopt, int facility);
int setlogmask(int maskpri);
void syslog(int priority, const char *message, ... /* arguments */);
```

DESCRIPTION

The *syslog*( ) function shall send a message to an implementation-defined logging facility, which may log it in an implementation-defined system log, write it to the system console, forward it to a list of users, or forward it to the logging facility on another host over the network. The logged message shall include a message header and a message body. The message header contains at least a timestamp and a tag string.

The message body is generated from the *message* and following arguments in the same manner as if these were arguments to *printf*( ), except that the additional conversion specification `%m` shall be recognized; it shall convert no arguments, shall cause the output of the error message string associated with the value of *errno* on entry to *syslog*( ), and may be mixed with argument specifications of the `"%n$"` form. If a complete conversion specification with the `m` conversion specifier character is not just `%m`, the behavior is undefined. A trailing <newline> may be added if needed.

Values of the *priority* argument are formed by OR'ing together a severity level value and an optional facility value. If no facility value is specified, the current default facility value is used.

Possible values of severity level include:

LOG_EMERG	A panic condition.
LOG_ALERT	A condition that should be corrected immediately, such as a corrupted system database.
LOG_CRIT	Critical conditions, such as hard device errors.
LOG_ERR	Errors.
LOG_WARNING	Warning messages.
LOG_NOTICE	Conditions that are not error conditions, but that may require special handling.
LOG_INFO	Informational messages.
LOG_DEBUG	Messages that contain information normally of use only when debugging a program.

The facility indicates the application or system component generating the message. Possible facility values include:

LOG_USER	Messages generated by arbitrary processes. This is the default facility identifier if none is specified.
LOG_LOCAL0	Reserved for local use.

LOG_LOCAL1	Reserved for local use.
LOG_LOCAL2	Reserved for local use.
LOG_LOCAL3	Reserved for local use.
LOG_LOCAL4	Reserved for local use.
LOG_LOCAL5	Reserved for local use.
LOG_LOCAL6	Reserved for local use.
LOG_LOCAL7	Reserved for local use.

The *openlog*( ) function shall set process attributes that affect subsequent calls to *syslog*( ). The *ident* argument is a string that is prepended to every message. The *logopt* argument indicates logging options. Values for *logopt* are constructed by a bitwise-inclusive OR of zero or more of the following:

LOG_PID	Log the process ID with each message. This is useful for identifying specific processes.
LOG_CONS	Write messages to the system console if they cannot be sent to the logging facility. The *syslog*( ) function ensures that the process does not acquire the console as a controlling terminal in the process of writing the message.
LOG_NDELAY	Open the connection to the logging facility immediately. Normally the open is delayed until the first message is logged. This is useful for programs that need to manage the order in which file descriptors are allocated.
LOG_ODELAY	Delay open until *syslog*( ) is called.
LOG_NOWAIT	Do not wait for child processes that may have been created during the course of logging the message. This option should be used by processes that enable notification of child termination using SIGCHLD, since *syslog*( ) may otherwise block waiting for a child whose exit status has already been collected.

The *facility* argument encodes a default facility to be assigned to all messages that do not have an explicit facility already encoded. The initial default facility is LOG_USER.

The *openlog*( ) and *syslog*( ) functions may allocate a file descriptor. It is not necessary to call *openlog*( ) prior to calling *syslog*( ).

The *closelog*( ) function shall close any open file descriptors allocated by previous calls to *openlog*( ) or *syslog*( ).

The *setlogmask*( ) function shall set the log priority mask for the current process to *maskpri* and return the previous mask. If the *maskpri* argument is 0, the current log mask is not modified. Calls by the current process to *syslog*( ) with a priority not set in *maskpri* shall be rejected. The default log mask allows all priorities to be logged. A call to *openlog*( ) is not required prior to calling *setlogmask*( ).

Symbolic constants for use as values of the *logopt*, *facility*, *priority*, and *maskpri* arguments are defined in the **<syslog.h>** header.

RETURN VALUE

The *setlogmask*( ) function shall return the previous log priority mask. The *closelog*( ), *openlog*( ), and *syslog*( ) functions shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

Using openlog( )

The following example causes subsequent calls to *syslog*( ) to log the process ID with each message, and to write messages to the system console if they cannot be sent to the logging facility.

```
#include <syslog.h>

char *ident = "Process demo";
int logopt = LOG_PID | LOG_CONS;
int facility = LOG_USER;
...
openlog(ident, logopt, facility);
```

Using setlogmask( )

The following example causes subsequent calls to *syslog*( ) to accept error messages or messages generated by arbitrary processes, and to reject all other messages.

```
#include <syslog.h>

int result;
int mask = LOG_MASK (LOG_ERR | LOG_USER);
...
result = setlogmask(mask);
```

Using syslog

The following example sends the message `"This is a message"` to the default logging facility, marking the message as an error message generated by random processes.

```
#include <syslog.h>

char *message = "This is a message";
int priority = LOG_ERR | LOG_USER;
...
syslog(priority, message);
```

Issue 5

Moved from X/OPEN UNIX extension to BASE.

NAME

confstr — get configurable variables

SYNOPSIS

```
#include <unistd.h>

size_t confstr(int name, char *buf, size_t len);
```

DESCRIPTION

The *confstr*( ) function shall return configuration-defined string values. Its use and purpose are similar to *sysconf*( ), but it is used where string values rather than numeric values are returned. |

The *name* argument represents the system variable to be queried. The implementation shall support the following name values, defined in **<unistd.h>**. It may support others:

_CS_PATH
_CS_POSIX_V6_ILP32_OFF32_CFLAGS
_CS_POSIX_V6_ILP32_OFF32_LDFLAGS
_CS_POSIX_V6_ILP32_OFF32_LIBS
_CS_POSIX_V6_ILP32_OFF32_LINTFLAGS
_CS_POSIX_V6_ILP32_OFFBIG_CFLAGS
_CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS
_CS_POSIX_V6_ILP32_OFFBIG_LIBS
_CS_POSIX_V6_ILP32_OFFBIG_LINTFLAGS
_CS_POSIX_V6_LP64_OFF64_CFLAGS
_CS_POSIX_V6_LP64_OFF64_LDFLAGS
_CS_POSIX_V6_LP64_OFF64_LIBS
_CS_POSIX_V6_LP64_OFF64_LINTFLAGS
_CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS
_CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS
_CS_POSIX_V6_LPBIG_OFFBIG_LIBS
_CS_POSIX_V6_LPBIG_OFFBIG_LINTFLAGS
XSI _CS_XBS5_ILP32_OFF32_CFLAGS (**LEGACY**)
_CS_XBS5_ILP32_OFF32_LDFLAGS (**LEGACY**)
_CS_XBS5_ILP32_OFF32_LIBS (**LEGACY**)
_CS_XBS5_ILP32_OFF32_LINTFLAGS (**LEGACY**)
_CS_XBS5_ILP32_OFFBIG_CFLAGS (**LEGACY**)
_CS_XBS5_ILP32_OFFBIG_LDFLAGS (**LEGACY**)
_CS_XBS5_ILP32_OFFBIG_LIBS (**LEGACY**)
_CS_XBS5_ILP32_OFFBIG_LINTFLAGS (**LEGACY**)
_CS_XBS5_LP64_OFF64_CFLAGS (**LEGACY**)
_CS_XBS5_LP64_OFF64_LDFLAGS (**LEGACY**)
_CS_XBS5_LP64_OFF64_LIBS (**LEGACY**)
_CS_XBS5_LP64_OFF64_LINTFLAGS (**LEGACY**)
_CS_XBS5_LPBIG_OFFBIG_CFLAGS (**LEGACY**)
_CS_XBS5_LPBIG_OFFBIG_LDFLAGS (**LEGACY**)
_CS_XBS5_LPBIG_OFFBIG_LIBS (**LEGACY**)
_CS_XBS5_LPBIG_OFFBIG_LINTFLAGS (**LEGACY**)

If *len* is not 0, and if *name* has a configuration-defined value, *confstr*( ) shall copy that value into the *len*-byte buffer pointed to by *buf*. If the string to be returned is longer than *len* bytes, including the terminating null, then *confstr*( ) shall truncate the string to *len*−1 bytes and null-terminate the result. The application can detect that the string was truncated by comparing the value returned by *confstr*( ) with *len*.

If *len* is 0 and *buf* is a null pointer, then *confstr*( ) shall still return the integer value as defined below, but shall not return a string. If *len* is 0 but *buf* is not a null pointer, the result is unspecified.

If the implementation supports the Shell option, the string stored in *buf* after a call to:

```
confstr(_CS_PATH, buf, sizeof(buf))
```

can be used as a value of the *PATH* environment variable that accesses all of the standard utilities of IEEE Std 1003.1-200x, if the return value is less than or equal to *sizeof*(*buf*).

RETURN VALUE

If *name* has a configuration-defined value, *confstr*( ) shall return the size of buffer that would be needed to hold the entire configuration-defined value including the terminating null. If this return value is greater than *len*, the string returned in *buf* is truncated.

If *name* is invalid, *confstr*( ) shall return 0 and set *errno* to indicate the error.

If *name* does not have a configuration-defined value, *confstr*( ) shall return 0 and leave *errno* unchanged.

ERRORS

The *confstr*( ) function shall fail if:

[EINVAL]	The value of the *name* argument is invalid.

EXAMPLES

None.

APPLICATION USAGE

An application can distinguish between an invalid *name* parameter value and one that corresponds to a configurable variable that has no configuration-defined value by checking if *errno* is modified. This mirrors the behavior of *sysconf*( ).

The original need for this function was to provide a way of finding the configuration-defined default value for the environment variable *PATH*. Since *PATH* can be modified by the user to include directories that could contain utilities replacing the standard utilities in the Shell and Utilities volume of IEEE Std 1003.1-200x, applications need a way to determine the system-supplied *PATH* environment variable value that contains the correct search path for the standard utilities.

An application could use:

```
confstr(name, (char *)NULL, (size_t)0)
```

to find out how big a buffer is needed for the string value; use *malloc*( ) to allocate a buffer to hold the string; and call *confstr*( ) again to get the string. Alternately, it could allocate a fixed, static buffer that is big enough to hold most answers (perhaps 512 or 1 024 bytes), but then use *malloc*( ) to allocate a larger buffer if it finds that this is too small.

RATIONALE

Application developers can normally determine any configuration variable by means of reading from the stream opened by a call to:

```
popen("command -p getconf variable", "r");
```

The *confstr*( ) function with a *name* argument of _CS_PATH returns a string that can be used as a *PATH* environment variable setting that will reference the standard shell and utilities as described in the Shell and Utilities volume of IEEE Std 1003.1-200x.

The *confstr*( ) function copies the returned string into a buffer supplied by the application instead of returning a pointer to a string. This allows a cleaner function in some implementations (such as those with lightweight threads) and resolves questions about when the application must copy the string returned.

FUTURE DIRECTIONS

None.

SEE ALSO

pathconf( ), *sysconf*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<unistd.h>**, the Shell and Utilities volume of IEEE Std 1003.1-200x, *c99*

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

A table indicating the permissible values of *name* are added to the DESCRIPTION. All those marked EX are new in this issue.

Issue 6

The Open Group Corrigendum U033/7 is applied. The return value for the case returning the size of the buffer now explicitly states that this includes the terminating null.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated with new arguments which can be used to determine configuration strings for C compiler flags, linker/loader flags, and libraries for each different supported programming environment. This is a change to support data size neutrality.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The DESCRIPTION is updated to include text describing how _CS_PATH can be used to obtain a *PATH* to access the standard utilities.

The macros associated with the *c89* programming models are marked LEGACY and new equivalent macros associated with *c99* are introduced.

NAME

conj, conjf, conjl — complex conjugate functions

SYNOPSIS

```
#include <complex.h>

double complex conj(double complex z);
float complex conjf(float complex z);
long double complex conjl(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the complex conjugate of *z*, by reversing the sign of its imaginary part.

RETURN VALUE

These functions return the complex conjugate value.

ERRORS

No errors are defined.

NAME

connect — connect a socket

SYNOPSIS

```
#include <sys/socket.h>

int connect(int socket, const struct sockaddr *address,
    socklen_t address_len);
```

DESCRIPTION

The *connect*( ) function shall attempt to make a connection on a socket. The function takes the following arguments:

socket	Specifies the file descriptor associated with the socket.
address	Points to a **sockaddr** structure containing the peer address. The length and format of the address depend on the address family of the socket.
address_len	Specifies the length of the **sockaddr** structure pointed to by the *address* argument.

If the socket has not already been bound to a local address, *connect*( ) shall bind it to an address which, unless the socket's address family is AF_UNIX, is an unused local address.

If the initiating socket is not connection-mode, then *connect*( ) shall set the socket's peer address, and no connection is made. For SOCK_DGRAM sockets, the peer address identifies where all datagrams are sent on subsequent *send*( ) functions, and limits the remote sender for subsequent *recv*( ) functions. If *address* is a null address for the protocol, the socket's peer address shall be reset.

If the initiating socket is connection-mode, then *connect*( ) shall attempt to establish a connection to the address specified by the *address* argument. If the connection cannot be established immediately and O_NONBLOCK is not set for the file descriptor for the socket, *connect*( ) shall block for up to an unspecified timeout interval until the connection is established. If the timeout interval expires before the connection is established, *connect*( ) shall fail and the connection attempt shall be aborted. If *connect*( ) is interrupted by a signal that is caught while blocked waiting to establish a connection, *connect*( ) shall fail and set *errno* to [EINTR], but the connection request shall not be aborted, and the connection shall be established asynchronously.

If the connection cannot be established immediately and O_NONBLOCK is set for the file descriptor for the socket, *connect*( ) shall fail and set *errno* to [EINPROGRESS], but the connection request shall not be aborted, and the connection shall be established asynchronously. Subsequent calls to *connect*( ) for the same socket, before the connection is established, shall fail and set *errno* to [EALREADY].

When the connection has been established asynchronously, *select*( ) and *poll*( ) shall indicate that the file descriptor for the socket is ready for writing.

The socket in use may require the process to have appropriate privileges to use the *connect*( ) function.

RETURN VALUE

Upon successful completion, *connect*( ) shall return 0; otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *connect*( ) function shall fail if:

[EADDRNOTAVAIL]
The specified address is not available from the local machine.

[EAFNOSUPPORT]	The specified address is not a valid address for the address family of the specified socket.
[EALREADY]	A connection request is already in progress for the specified socket.
[EBADF]	The *socket* argument is not a valid file descriptor.
[ECONNREFUSED]	The target address was not listening for connections or refused the connection request.
[EINPROGRESS]	O_NONBLOCK is set for the file descriptor for the socket and the connection cannot be immediately established; the connection shall be established asynchronously.
[EINTR]	The attempt to establish a connection was interrupted by delivery of a signal that was caught; the connection shall be established asynchronously.
[EISCONN]	The specified socket is connection-mode and is already connected.
[ENETUNREACH]	No route to the network is present.
[ENOTSOCK]	The *socket* argument does not refer to a socket.
[EPROTOTYPE]	The specified address has a different type than the socket bound to the specified peer address.
[ETIMEDOUT]	The attempt to connect timed out before a connection was made.

If the address family of the socket is AF_UNIX, then *connect*( ) shall fail if:

[EIO]	An I/O error occurred while reading from or writing to the file system.
[ELOOP]	A loop exists in symbolic links encountered during resolution of the pathname in *address*.
[ENAMETOOLONG]	A component of a pathname exceeded {NAME_MAX} characters, or an entire pathname exceeded {PATH_MAX} characters.
[ENOENT]	A component of the pathname does not name an existing file or the pathname is an empty string.
[ENOTDIR]	A component of the path prefix of the pathname in *address* is not a directory.

The *connect*( ) function may fail if:

[EACCES]	Search permission is denied for a component of the path prefix; or write access to the named socket is denied.
[EADDRINUSE]	Attempt to establish a connection that uses addresses that are already in use.
[ECONNRESET]	Remote host reset the connection request.
[EHOSTUNREACH]	The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).
[EINVAL]	The *address_len* argument is not a valid length for the address family; or invalid address family in the **sockaddr** structure.

[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in *address*.
[ENAMETOOLONG]	Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.
[ENETDOWN]	The local network interface used to reach the destination is down.
[ENOBUFS]	No buffer space is available.
[EOPNOTSUPP]	The socket is listening and cannot be connected.

EXAMPLES

None.

APPLICATION USAGE

If *connect*( ) fails, the state of the socket is unspecified. Conforming applications should close the file descriptor and create a new socket before attempting to reconnect.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

accept( ), *bind*( ), *close*( ), *getsockname*( ), *poll*( ), *select*( ), *send*( ), *shutdown*( ), *socket*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/socket.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

NAME

copysign, copysignf, copysignl — number manipulation function

SYNOPSIS

```
#include <math.h>

double copysign(double x, double y);
float copysignf(float x, float y);
long double copysignl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall produce a value with the magnitude of *x* and the sign of *y*. On implementations that represent a signed zero but do not treat negative zero consistently in arithmetic operations, these functions regard the sign of zero as positive.

RETURN VALUE

Upon successful completion, these functions shall return a value with the magnitude of *x* and the sign of *y*.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

NAME

cos, cosf, cosl — cosine function

SYNOPSIS

```
#include <math.h>

double cos(double x);
float cosf(float x);
long double cosl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the cosine of their argument *x*, measured in radians.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the cosine of *x*.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, the value 1.0 shall be returned.

If *x* is ±Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

ERRORS

These functions shall fail if:

MX

Domain Error	The *x* argument is ±Inf.
	If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

Taking the Cosine of a 45-Degree Angle

```
#include <math.h>
...
double radians = 45 * M_PI / 180;
double result;
...
result = cos(radians);
```

APPLICATION USAGE

These functions may lose accuracy when their argument is near an odd multiple of π/2 or is far from 0.

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *cosf*( ) and *cosl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

cosf — cosine function

SYNOPSIS

```
#include <math.h>

float cosf(float x);
```

DESCRIPTION

Refer to *cos*( ).

NAME

cosh, coshf, coshl — hyperbolic cosine functions

SYNOPSIS

```
#include <math.h>

double cosh(double x);
float coshf(float x);
long double coshl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the hyperbolic cosine of their argument *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the hyperbolic cosine of *x*.

If the correct value would cause overflow, a range error shall occur and *cosh*( ), *coshf*( ), and *coshl*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, the value 1.0 shall be returned.

If *x* is ±Inf, +Inf shall be returned.

ERRORS

These functions shall fail if:

Range Error	The result would cause an overflow. If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

For IEEE Std 754-1985 **double**, $710.5 < |x|$ implies that *cosh*(*x*) has overflowed.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

cproj, cprojf, cprojl — complex projection functions

SYNOPSIS

```
#include <complex.h>

double complex cproj(double complex z);
float complex cprojf(float complex z);
long double complex cprojl(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute a projection of *z* onto the Riemann sphere: *z* projects to *z*, except that all complex infinities (even those with one infinite part and one NaN part) project to positive infinity on the real axis. If *z* has an infinite part, then *cproj*(*z*) shall be equivalent to: |

```
INFINITY + I * copysign(0.0, cimag(z))
```

RETURN VALUE

These functions shall return the value of the projection onto the Riemann sphere.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Two topologies are commonly used in complex mathematics: the complex plane with its continuum of infinities, and the Riemann sphere with its single infinity. The complex plane is better suited for transcendental functions, the Riemann sphere for algebraic functions. The complex types with their multiplicity of infinities provide a useful (though imperfect) model for the complex plane. The *cproj*( ) function helps model the Riemann sphere by mapping all infinities to one, and should be used just before any operation, especially comparisons, that might give spurious results for any of the other infinities. Note that a complex value with one infinite part and one NaN part is regarded as an infinity, not a NaN, because if one part is infinite, the complex value is infinite independent of the value of the other part. For the same reason, *cabs*( ) returns an infinity if its argument has an infinite part and a NaN part.

FUTURE DIRECTIONS

None.

carg( ), *cimag*( ), *conj*( ), *creal*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<complex.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

NAME

creal, crealf, creall — complex real functions

SYNOPSIS

```
#include <complex.h>

double creal(double complex z);
float crealf(float complex z);
long double creall(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the real part of *z*.

RETURN VALUE

These functions shall return the real part value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

For a variable *z* of complex type:

```
z == creal(z) + cimag(z)*I
```

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

creat — create a new file or rewrite an existing one

SYNOPSIS

OH

```
#include <sys/stat.h>
#include <fcntl.h>

int creat(const char *path, mode_t mode);
```

DESCRIPTION

The function call:

```
creat(path, mode)
```

shall be equivalent to:

```
open(path, O_WRONLY|O_CREAT|O_TRUNC, mode)
```

RETURN VALUE

Refer to *open*( ).

ERRORS

Refer to *open*( ).

EXAMPLES

Creating a File

The following example creates the file **/tmp/file** with read and write permissions for the file owner and read permission for group and others. The resulting file descriptor is assigned to the *fd* variable.

```
#include <fcntl.h>
...
int fd;
mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
char *filename = "/tmp/file";
...
fd = creat(filename, mode);
...
```

APPLICATION USAGE

None.

RATIONALE

The *creat*( ) function is redundant. Its services are also provided by the *open*( ) function. It has been included primarily for historical purposes since many existing applications depend on it. It is best considered a part of the C binding rather than a function that should be provided in other languages.

FUTURE DIRECTIONS

None.

SEE ALSO

open( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<fcntl.h>**, **<sys/stat.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

NAME

crypt — string encoding function (**CRYPT**)

SYNOPSIS

XSI

```
#include <unistd.h>

char *crypt(const char *key, const char *salt);

```

DESCRIPTION

The *crypt*( ) function is a string encoding function. The algorithm is implementation-defined.

The *key* argument points to a string to be encoded. The *salt* argument is a string chosen from the set:

```
a b c d e f g h i j k l m n o p q r s t u v w x y z
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
0 1 2 3 4 5 6 7 8 9 . /
```

The first two characters of this string may be used to perturb the encoding algorithm.

The return value of *crypt*( ) points to static data that is overwritten by each call.

The *crypt*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *crypt*( ) shall return a pointer to the encoded string. The first two characters of the returned value shall be those of the *salt* argument. Otherwise, it shall return a null pointer and set *errno* to indicate the error. |

ERRORS

The *crypt*( ) function shall fail if:

[ENOSYS] The functionality is not supported on this implementation.

EXAMPLES

Encoding Passwords

The following example finds a user database entry matching a particular user name and changes the current password to a new password. The *crypt*( ) function generates an encoded version of each password. The first call to *crypt*( ) produces an encoded version of the old password; that encoded password is then compared to the password stored in the user database. The second call to *crypt*( ) encodes the new password before it is stored. |

The *putpwent*( ) function, used in the following example, is not part of IEEE Std 1003.1-200x.

```
#include <unistd.h>
#include <pwd.h>
#include <string.h>
#include <stdio.h>
...
int valid_change;
int pfd;  /* Integer for file descriptor returned by open(). */
FILE *fpfd;  /* File pointer for use in putpwent(). */
struct passwd *p;
char user[100];
char oldpasswd[100];
char newpasswd[100];
```

```
        char savepasswd[100];
        ...
        valid_change = 0;
        while ((p = getpwent()) != NULL) {
            /* Change entry if found. */
            if (strcmp(p->pw_name, user) == 0) {
                if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
                    strcpy(savepasswd, crypt(newpasswd, user));
                    p->pw_passwd = savepasswd;
                    valid_change = 1;
                }
                else {
                    fprintf(stderr, "Old password is not valid\n");
                }
            }
            /* Put passwd entry into ptmp. */
            putpwent(p, fpfd);
        }
```

APPLICATION USAGE

The values returned by this function need not be portable among XSI-conformant systems.

```

DESCRIPTION

Refer to *ctan*( ).

NAME

ctermid — generate a pathname for controlling terminal

SYNOPSIS

CX
```
#include <stdio.h>

char *ctermid(char *s);
```

DESCRIPTION

The *ctermid*( ) function shall generate a string that, when used as a pathname, refers to the current controlling terminal for the current process. If *ctermid*( ) returns a pathname, access to the file is not guaranteed.

If the application uses any of the _POSIX_THREAD_SAFE_FUNCTIONS or _POSIX_THREADS functions, it shall ensure that the *ctermid*( ) function is called with a non-NULL parameter.

RETURN VALUE

If *s* is a null pointer, the string shall be generated in an area that may be static (and therefore may be overwritten by each call), the address of which shall be returned. Otherwise, *s* is assumed to point to a character array of at least L_ctermid bytes; the string is placed in this array and the value of *s* shall be returned. The symbolic constant L_ctermid is defined in **<stdio.h>**, and shall have a value greater than 0.

The *ctermid*( ) function shall return an empty string if the pathname that would refer to the controlling terminal cannot be determined, or if the function is unsuccessful.

ERRORS

No errors are defined.

EXAMPLES

Determining the Controlling Terminal for the Current Process

The following example returns a pointer to a string that identifies the controlling terminal for the current process. The pathname for the terminal is stored in the array pointed to by the *ptr* argument, which has a size of L_ctermid bytes, as indicated by the *term* argument.

```
#include <stdio.h>
...
char term[L_ctermid];
char *ptr;

ptr = ctermid(term);
```

APPLICATION USAGE

The difference between *ctermid*( ) and *ttyname*( ) is that *ttyname*( ) must be handed a file descriptor and return a path of the terminal associated with that file descriptor, while *ctermid*( ) returns a string (such as `"/dev/tty"`) that refers to the current controlling terminal if used as a pathname.

RATIONALE

L_ctermid must be defined appropriately for a given implementation and must be greater than zero so that array declarations using it are accepted by the compiler. The value includes the terminating null byte.

Conforming applications that use threads cannot call *ctermid*( ) with NULL as the parameter if either _POSIX_THREAD_SAFE_FUNCTIONS or _POSIX_THREADS is defined. If *s* is not NULL, the *ctermid*( ) function generates a string that, when used as a pathname, refers to the current controlling terminal for the current process. If *s* is NULL, the return value of *ctermid*( ) is undefined.

There is no additional burden on the programmer—changing to use a hypothetical thread-safe version of *ctermid*( ) along with allocating a buffer is more of a burden than merely allocating a buffer. Application code should not assume that the returned string is short, as some implementations have more than two pathname components before reaching a logical device name.

FUTURE DIRECTIONS

None.

SEE ALSO

ttyname( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

NAME

ctime, ctime_r — convert a time value to date and time string

SYNOPSIS

```
#include <time.h>

char *ctime(const time_t *clock);
char *ctime_r(const time_t *clock, char *buf);
```

TSF (ctime_r)

DESCRIPTION

CX For *ctime*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *ctime*( ) function shall convert the time pointed to by *clock*, representing time in seconds since the Epoch, to local time in the form of a string. It shall be equivalent to:

```
asctime(localtime(clock))
```

CX The *asctime*( ), *ctime*( ), *gmtime*( ), and *localtime*( ) functions shall return values in one of two static objects: a broken-down time structure and an array of **char**. Execution of any of the functions may overwrite the information returned in either of these objects by any of the other functions.

The *ctime*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

TSF The *ctime_r*( ) function shall convert the calendar time pointed to by *clock* to local time in exactly the same form as *ctime*( ) and puts the string into the array pointed to by *buf* (which shall be at least 26 bytes in size) and return *buf*.

Unlike *ctime*( ), the thread-safe version *ctime_r*( ) is not required to set *tzname*.

RETURN VALUE

The *ctime*( ) function shall return the pointer returned by *asctime*( ) with that broken-down time as an argument.

TSF Upon successful completion, *ctime_r*( ) shall return a pointer to the string pointed to by *buf*. When an error is encountered, a null pointer shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Values for the broken-down time structure can be obtained by calling *gmtime*( ) or *localtime*( ). The *ctime*( ) function is included for compatibility with older implementations, and does not support localized date and time formats. Applications should use the *strftime*( ) function to achieve maximum portability.

The *ctime_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

asctime( ), *clock*( ), *difftime*( ), *gmtime*( ), *localtime*( ), *mktime*( ), *strftime*( ), *strptime*( ), *time*( ), *utime*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<time.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

The *ctime_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *ctime*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

Extensions beyond the ISO C standard are now marked.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

NAME

daylight — daylight savings time flag

SYNOPSIS

XSI

```
#include <time.h>

extern int daylight;
```

DESCRIPTION

Refer to *tzset*( ).

NAME

dbm_clearerr, dbm_close, dbm_delete, dbm_error, dbm_fetch, dbm_firstkey, dbm_nextkey, dbm_open, dbm_store — database functions

SYNOPSIS

XSI
```
#include <ndbm.h>

int dbm_clearerr(DBM *db);
void dbm_close(DBM *db);
int dbm_delete(DBM *db, datum key);
int dbm_error(DBM *db);
datum dbm_fetch(DBM *db, datum key);
datum dbm_firstkey(DBM *db);
datum dbm_nextkey(DBM *db);
DBM *dbm_open(const char *file, int open_flags, mode_t file_mode);
int dbm_store(DBM *db, datum key, datum content, int store_mode);
```

DESCRIPTION

These functions create, access, and modify a database.

A **datum** consists of at least two members, *dptr* and *dsize*. The *dptr* member points to an object that is *dsize* bytes in length. Arbitrary binary data, as well as character strings, may be stored in the object pointed to by *dptr*.

The database is stored in two files. One file is a directory containing a bit map of keys and has **.dir** as its suffix. The second file contains all data and has **.pag** as its suffix.

The *dbm_open*( ) function shall open a database. The *file* argument to the function is the pathname of the database. The function opens two files named *file*.**dir** and *file*.**pag**. The *open_flags* argument has the same meaning as the *flags* argument of *open*( ) except that a database opened for write-only access opens the files for read and write access and the behavior of the O_APPEND flag is unspecified. The *file_mode* argument has the same meaning as the third argument of *open*( ).

The *dbm_close*( ) function shall close a database. The application shall ensure that argument *db* is a pointer to a **dbm** structure that has been returned from a call to *dbm_open*( ).

These database functions shall support an internal block size large enough to support key/content pairs of at least 1 023 bytes.

The *dbm_fetch*( ) function shall read a record from a database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ). The argument *key* is a **datum** that has been initialized by the application to the value of the key that matches the key of the record the program is fetching.

The *dbm_store*( ) function shall write a record to a database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ). The argument *key* is a **datum** that has been initialized by the application to the value of the key that identifies (for subsequent reading, writing, or deleting) the record the application is writing. The argument *content* is a **datum** that has been initialized by the application to the value of the record the program is writing. The argument *store_mode* controls whether *dbm_store*( ) replaces any pre-existing record that has the same key that is specified by the *key* argument. The application shall set *store_mode* to either DBM_INSERT or DBM_REPLACE. If the database contains a record that matches the *key* argument and *store_mode* is DBM_REPLACE, the existing record shall be replaced with the new record. If the database contains a record that matches the *key* argument and *store_mode* is DBM_INSERT, the existing record shall be left unchanged and the new record ignored. If the database does not contain a record that matches the *key* argument and *store_mode* is either DBM_INSERT or DBM_REPLACE, the new record shall be inserted in the database.

If the sum of a key/content pair exceeds the internal block size, the result is unspecified. Moreover, the application shall ensure that all key/content pairs that hash together fit on a single block. The *dbm_store*( ) function shall return an error in the event that a disk block fills with inseparable data.

The *dbm_delete*( ) function shall delete a record and its key from the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ). The argument *key* is a **datum** that has been initialized by the application to the value of the key that identifies the record the program is deleting.

The *dbm_firstkey*( ) function shall return the first key in the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ).

The *dbm_nextkey*( ) function shall return the next key in the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ). The application shall ensure that the *dbm_firstkey*( ) function is called before calling *dbm_nextkey*( ). Subsequent calls to *dbm_nextkey*( ) return the next key until all of the keys in the database have been returned.

The *dbm_error*( ) function shall return the error condition of the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ).

The *dbm_clearerr*( ) function shall clear the error condition of the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ).

The *dptr* pointers returned by these functions may point into static storage that may be changed by subsequent calls.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

The *dbm_store*( ) and *dbm_delete*( ) functions shall return 0 when they succeed and a negative value when they fail.

The *dbm_store*( ) function shall return 1 if it is called with a *flags* value of DBM_INSERT and the function finds an existing record with the same key.

The *dbm_error*( ) function shall return 0 if the error condition is not set and return a non-zero value if the error condition is set.

The return value of *dbm_clearerr*( ) is unspecified.

The *dbm_firstkey*( ) and *dbm_nextkey*( ) functions shall return a key **datum**. When the end of the database is reached, the *dptr* member of the key is a null pointer. If an error is detected, the *dptr* member of the key shall be a null pointer and the error condition of the database shall be set.

The *dbm_fetch*( ) function shall return a content **datum**. If no record in the database matches the key or if an error condition has been detected in the database, the *dptr* member of the content shall be a null pointer.

The *dbm_open*( ) function shall return a pointer to a database structure. If an error is detected during the operation, *dbm_open*( ) shall return a (**DBM ***)0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The following code can be used to traverse the database:

```
for(key = dbm_firstkey(db); key.dptr != NULL; key = dbm_nextkey(db))
```

The *dbm_* functions provided in this library should not be confused in any way with those of a general-purpose database management system. These functions do not provide for multiple search keys per entry, they do not protect against multi-user access (in other words they do not lock records or files), and they do not provide the many other useful database functions that are found in more robust database management systems. Creating and updating databases by use of these functions is relatively slow because of data copies that occur upon hash collisions. These functions are useful for applications requiring fast lookup of relatively static information that is to be indexed by a single key.

The *dbm_delete*( ) function need not physically reclaim file space, although it does make it available for reuse by the database.

After calling *dbm_store*( ) or *dbm_delete*( ) during a pass through the keys by *dbm_firstkey*( ) and *dbm_nextkey*( ), the application should reset the database by calling *dbm_firstkey*( ) before again calling *dbm_nextkey*( ). The contents of these files are unspecified and may not be portable.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

NAME

difftime — compute the difference between two calendar time values

SYNOPSIS

```
#include <time.h>

double difftime(time_t time1, time_t time0);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *difftime*( ) function shall compute the difference between two calendar times (as returned by *time*( )): *time1* − *time0*.

RETURN VALUE

The *difftime*( ) function shall return the difference expressed in seconds as a type **double**.

ERRORS

No errors are defined.

EXAMPLES

NAME

dirname — report the parent directory name of a file pathname |

SYNOPSIS

XSI
```
#include <libgen.h>

char *dirname(char *path);
```

DESCRIPTION

The *dirname*( ) function shall take a pointer to a character string that contains a pathname, and return a pointer to a string that is a pathname of the parent directory of that file. Trailing `'/'` characters in the path are not counted as part of the path. |

If *path* does not contain a `'/'`, then *dirname*( ) shall return a pointer to the string `"."`. If *path* is a null pointer or points to an empty string, *dirname*( ) shall return a pointer to the string `"."`.

The *dirname*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

The *dirname*( ) function shall return a pointer to a string that is the parent directory of *path*. If *path* is a null pointer or points to an empty string, a pointer to a string `"."` is returned.

The *dirname*( ) function may modify the string pointed to by *path*, and may return a pointer to static storage that may then be overwritten by subsequent calls to *dirname*( ).

ERRORS

No errors are defined.

EXAMPLES

The following code fragment reads a pathname, changes the current working directory to the parent directory, and opens the file. |

```
char path[MAXPATHLEN], *pathcopy;
int fd;
fgets(path, MAXPATHLEN, stdin);
pathcopy = strdup(path);
chdir(dirname(pathcopy));
fd = open(basename(path), O_RDONLY);
```

Sample Input and Output Strings for dirname( )

In the following table, the input string is the value pointed to by *path*, and the output string is the return value of the *dirname*( ) function.

Input String	Output String
`"/usr/lib"`	`"/usr"`
`"/usr/"`	`"/"`
`"usr"`	`"."`
`"/"`	`"/"`
`"."`	`"."`
`".."`	`"."`

Changing the Current Directory to the Parent Directory

The following program fragment reads a pathname, changes the current working directory to the parent directory, and opens the file. |

```
#include <unistd.h>
#include <limits.h>
#include <stdio.h>
#include <fcntl.h>
#include <string.h>
#include <libgen.h>
...
char path[PATH_MAX], *pathcopy;
int fd;
...
fgets(path, PATH_MAX, stdin);
pathcopy = strdup(path);
chdir(dirname(pathcopy));
fd = open(basename(path), O_RDONLY);
```

APPLICATION USAGE

The *dirname*( ) and *basename*( ) functions together yield a complete pathname. The expression *dirname*(*path*) obtains the pathname of the directory where *basename*(*path*) is found. |

Since the meaning of the leading `"//"` is implementation-defined, *dirname*("**//foo**) may return either `"//"` or `'/'` (but nothing else).

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

div — compute the quotient and remainder of an integer division

SYNOPSIS

```
#include <stdlib.h>

div_t div(int numer, int denom);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *div*( ) function shall compute the quotient and remainder of the division of the numerator *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the integer of lesser magnitude that is the nearest to the algebraic quotient. If the result cannot be represented, the behavior is undefined; otherwise, *quot***denom*+*rem* shall equal *numer*.

RETURN VALUE

The *div*( ) function shall return a structure of type **div_t**, comprising both the quotient and the remainder. The structure includes the following members, in any order:

```
int  quot;  /* quotient */
int  rem;   /* remainder */
```

ERRORS

No errors are defined.

EXAMPLES

NAME

dlclose — close a *dlopen*( ) object

SYNOPSIS

XSI

```
#include <dlfcn.h>

int dlclose(void *handle);
```

DESCRIPTION

The *dlclose*( ) function shall inform the system that the object referenced by a *handle* returned from a previous *dlopen*( ) invocation is no longer needed by the application.

The use of *dlclose*( ) reflects a statement of intent on the part of the process, but does not create any requirement upon the implementation, such as removal of the code or symbols referenced by *handle*. Once an object has been closed using *dlclose*( ) an application should assume that its symbols are no longer available to *dlsym*( ). All objects loaded automatically as a result of invoking *dlopen*( ) on the referenced object shall also be closed if this is the last reference to it.

Although a *dlclose*( ) operation is not required to remove structures from an address space, neither is an implementation prohibited from doing so. The only restriction on such a removal is that no object shall be removed to which references have been relocated, until or unless all such references are removed. For instance, an object that had been loaded with a *dlopen*( ) operation specifying the RTLD_GLOBAL flag might provide a target for dynamic relocations performed in the processing of other objects—in such environments, an application may assume that no relocation, once made, shall be undone or remade unless the object requiring the relocation has itself been removed.

RETURN VALUE

If the referenced object was successfully closed, *dlclose*( ) shall return 0. If the object could not be closed, or if *handle* does not refer to an open object, *dlclose*( ) shall return a non-zero value. More detailed diagnostic information shall be available through *dlerror*( ).

ERRORS

No errors are defined.

EXAMPLES

The following example illustrates use of *dlopen*( ) and *dlclose*( ):

```
...
/* Open a dynamic library and then close it ... */

#include <dlfcn.h>
void *mylib;
int eret;

mylib = dlopen("mylib.so", RTLD_LOCAL | RTLD_LAZY);
...
eret = dlclose(mylib);
...
```

APPLICATION USAGE

A conforming application should employ a *handle* returned from a *dlopen*( ) invocation only within a given scope bracketed by the *dlopen*( ) and *dlclose*( ) operations. Implementations are free to use reference counting or other techniques such that multiple calls to *dlopen*( ) referencing the same object may return the same object for *handle*. Implementations are also free to reuse a *handle*. For these reasons, the value of a *handle* must be treated as an opaque object by the application, used only in calls to *dlsym*( ) and *dlclose*( ).

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

dlerror( ), *dlopen*( ), *dlsym*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<dlfcn.h>**

CHANGE HISTORY

First released in Issue 5.

Issue 6

The DESCRIPTION is updated to say that the referenced object is closed ‘‘if this is the last reference to it’’.

NAME

dlerror — get diagnostic information

SYNOPSIS

XSI

```
#include <dlfcn.h>

char *dlerror(void);
```

DESCRIPTION

The *dlerror*( ) function shall return a null-terminated character string (with no trailing <newline>) that describes the last error that occurred during dynamic linking processing. If no dynamic linking errors have occurred since the last invocation of *dlerror*( ), *dlerror*( ) shall return NULL. Thus, invoking *dlerror*( ) a second time, immediately following a prior invocation, shall result in NULL being returned.

The *dlerror*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

If successful, *dlerror*( ) shall return a null-terminated character string; otherwise, NULL shall be returned.

ERRORS

No errors are defined.

EXAMPLES

The following example prints out the last dynamic linking error:

```
...
#include <dlfcn.h>

char *errstr;

errstr = dlerror();
if (errstr != NULL)
printf ("A dynamic linking error occurred: (%s)\n", errstr);
...
```

APPLICATION USAGE

The messages returned by *dlerror*( ) may reside in a static buffer that is overwritten on each call to *dlerror*( ). Application code should not write to this buffer. Programs wishing to preserve an error message should make their own copies of that message. Depending on the application environment with respect to asynchronous execution events, such as signals or other asynchronous computation sharing the address space, conforming applications should use a critical section to retrieve the error pointer and buffer. |

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

dlclose( ), *dlopen*( ), *dlsym*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<dlfcn.h>**

CHANGE HISTORY

First released in Issue 5.

Issue 6

In the DESCRIPTION the note about reentrancy and thread-safety is added.

NAME

dlopen — gain access to an executable object file

SYNOPSIS

XSI

```
#include <dlfcn.h>

void *dlopen(const char *file, int mode);
```

DESCRIPTION

The *dlopen*( ) function shall make an executable object file specified by *file* available to the calling program. The class of files eligible for this operation and the manner of their construction are implementation-defined, though typically such files are executable objects such as shared libraries, relocatable files, or programs. Note that some implementations permit the construction of dependencies between such objects that are embedded within files. In such cases, a *dlopen*( ) operation shall load such dependencies in addition to the object referenced by *file*. Implementations may also impose specific constraints on the construction of programs that can employ *dlopen*( ) and its related services.

A successful *dlopen*( ) shall return a *handle* which the caller may use on subsequent calls to *dlsym*( ) and *dlclose*( ). The value of this *handle* should not be interpreted in any way by the caller.

The *file* argument is used to construct a pathname to the object file. If *file* contains a slash character, the *file* argument is used as the pathname for the file. Otherwise, *file* is used in an implementation-defined manner to yield a pathname.

If the value of *file* is 0, *dlopen*( ) shall provide a *handle* on a global symbol object. This object shall provide access to the symbols from an ordered set of objects consisting of the original program image file, together with any objects loaded at program start-up as specified by that process image file (for example, shared libraries), and the set of objects loaded using a *dlopen*( ) operation together with the RTLD_GLOBAL flag. As the latter set of objects can change during execution, the set identified by *handle* can also change dynamically.

Only a single copy of an object file is brought into the address space, even if *dlopen*( ) is invoked multiple times in reference to the file, and even if different pathnames are used to reference the file.

The *mode* parameter describes how *dlopen*( ) shall operate upon *file* with respect to the processing of relocations and the scope of visibility of the symbols provided within *file*. When an object is brought into the address space of a process, it may contain references to symbols whose addresses are not known until the object is loaded. These references shall be relocated before the symbols can be accessed. The *mode* parameter governs when these relocations take place and may have the following values:

RTLD_LAZY	Relocations shall be performed at an implementation-defined time, ranging from the time of the *dlopen*( ) call until the first reference to a given symbol occurs. Specifying RTLD_LAZY should improve performance on implementations supporting dynamic symbol binding as a process may not reference all of the functions in any given object. And, for systems supporting dynamic symbol resolution for normal process execution, this behavior mimics the normal handling of process execution.
RTLD_NOW	All necessary relocations shall be performed when the object is first loaded. This may waste some processing if relocations are performed for functions that are never referenced. This behavior may be useful for applications that need to know as soon as an object is loaded that all

symbols referenced during execution are available.

Any object loaded by *dlopen*( ) that requires relocations against global symbols can reference the symbols in the original process image file, any objects loaded at program start-up, from the object itself as well as any other object included in the same *dlopen*( ) invocation, and any objects that were loaded in any *dlopen*( ) invocation and which specified the RTLD_GLOBAL flag. To determine the scope of visibility for the symbols loaded with a *dlopen*( ) invocation, the *mode* parameter should be a bitwise-inclusive OR with one of the following values:

RTLD_GLOBAL	The object's symbols shall be made available for the relocation processing of any other object. In addition, symbol lookup using *dlopen*(*0*, *mode*) and an associated *dlsym*( ) allows objects loaded with this *mode* to be searched.
RTLD_LOCAL	The object's symbols shall not be made available for the relocation processing of any other object.

If neither RTLD_GLOBAL nor RTLD_LOCAL are specified, then an implementation-defined default behavior shall be applied.

If a *file* is specified in multiple *dlopen*( ) invocations, *mode* is interpreted at each invocation. Note, however, that once RTLD_NOW has been specified all relocations shall have been completed rendering further RTLD_NOW operations redundant and any further RTLD_LAZY operations irrelevant. Similarly, note that once RTLD_GLOBAL has been specified the object shall maintain the RTLD_GLOBAL status regardless of any previous or future specification of RTLD_LOCAL, as long as the object remains in the address space (see *dlclose*( )).

Symbols introduced into a program through calls to *dlopen*( ) may be used in relocation activities. Symbols so introduced may duplicate symbols already defined by the program or previous *dlopen*( ) operations. To resolve the ambiguities such a situation might present, the resolution of a symbol reference to symbol definition is based on a symbol resolution order. Two such resolution orders are defined: *load* or *dependency* ordering. Load order establishes an ordering among symbol definitions, such that the definition first loaded (including definitions from the image file and any dependent objects loaded with it) has priority over objects added later (via *dlopen*( )). Load ordering is used in relocation processing. Dependency ordering uses a breadth-first order starting with a given object, then all of its dependencies, then any dependents of those, iterating until all dependencies are satisfied. With the exception of the global symbol object obtained via a *dlopen*( ) operation on a *file* of 0, dependency ordering is used by the *dlsym*( ) function. Load ordering is used in *dlsym*( ) operations upon the global symbol object.

When an object is first made accessible via *dlopen*( ) it and its dependent objects are added in dependency order. Once all the objects are added, relocations are performed using load order. Note that if an object or its dependencies had been previously loaded, the load and dependency orders may yield different resolutions.

The symbols introduced by *dlopen*( ) operations, and available through *dlsym*( ) are at a minimum those which are exported as symbols of global scope by the object. Typically such symbols shall be those that were specified in (for example) C source code as having *extern* linkage. The precise manner in which an implementation constructs the set of exported symbols for a *dlopen*( ) object is specified by that implementation.

RETURN VALUE

If *file* cannot be found, cannot be opened for reading, is not of an appropriate object format for processing by *dlopen*( ), or if an error occurs during the process of loading *file* or relocating its symbolic references, *dlopen*( ) shall return NULL. More detailed diagnostic information shall be available through *dlerror*( ).

ERRORS

No errors are defined.

NAME

dlsym — obtain the address of a symbol from a *dlopen*( ) object

SYNOPSIS

XSI

```
#include <dlfcn.h>

void *dlsym(void *restrict handle, const char *restrict name);
```

DESCRIPTION

The *dlsym*( ) function shall obtain the address of a symbol defined within an object made accessible through a *dlopen*( ) call. The *handle* argument is the value returned from a call to *dlopen*( ) (and which has not since been released via a call to *dlclose*( )), and *name* is the symbol's name as a character string.

The *dlsym*( ) function shall search for the named symbol in all objects loaded automatically as a result of loading the object referenced by *handle* (see *dlopen*( )). Load ordering is used in *dlsym*( ) operations upon the global symbol object. The symbol resolution algorithm used shall be dependency order as described in *dlopen*( ).

The RTLD_NEXT flag is reserved for future use.

RETURN VALUE

If *handle* does not refer to a valid object opened by *dlopen*( ), or if the named symbol cannot be found within any of the objects associated with *handle*, *dlsym*( ) shall return NULL. More detailed diagnostic information shall be available through *dlerror*( ).

ERRORS

No errors are defined.

EXAMPLES

The following example shows how *dlopen*( ) and *dlsym*( ) can be used to access either function or data objects. For simplicity, error checking has been omitted.

```
void    *handle;
int     *iptr, (*fptr)(int);

/* open the needed object */
handle = dlopen("/usr/home/me/libfoo.so", RTLD_LOCAL | RTLD_LAZY);

/* find the address of function and data objects */
fptr = (int (*)(int))dlsym(handle, "my_function");
iptr = (int *)dlsym(handle, "my_object");

/* invoke function, passing value of integer as a parameter */
(*fptr)(*iptr);
```

APPLICATION USAGE

Special purpose values for *handle* are reserved for future use. These values and their meanings are:

RTLD_DEFAULT	The symbol lookup happens in the normal global scope; that is, a search for a symbol using this handle would find the same definition as a direct use of this symbol in the program code.
RTLD_NEXT	Specifies the next object after this one that defines *name*. *This one* refers to the object containing the invocation of *dlsym*( ). The *next* object is the one found upon the application of a load order symbol resolution algorithm (see *dlopen*( )). The next object is either one of global scope (because it was introduced as part of the original process image or because it was added with

a *dlopen*( ) operation including the RTLD_GLOBAL flag), or is an object that was included in the same *dlopen*( ) operation that loaded this one.

The RTLD_NEXT flag is useful to navigate an intentionally created hierarchy of multiply-defined symbols created through *interposition*. For example, if a program wished to create an implementation of *malloc*( ) that embedded some statistics gathering about memory allocations, such an implementation could use the real *malloc*( ) definition to perform the memory allocation—and itself only embed the necessary logic to implement the statistics gathering function.

RATIONALE

CHANGE HISTORY

First released in Issue 5.

Issue 6

The **restrict** keyword is added to the *dlsym*( ) prototype for alignment with the ISO / IEC 9899: 1999 standard.

NAME

drand48, erand48, jrand48, lcong48, lrand48, mrand48, nrand48, seed48, srand48 — generate uniformly distributed pseudo-random numbers

SYNOPSIS

XSI
```
#include <stdlib.h>

double drand48(void);
double erand48(unsigned short xsubi[3]);
long jrand48(unsigned short xsubi[3]);
void lcong48(unsigned short param[7]);
long lrand48(void);
long mrand48(void);
long nrand48(unsigned short xsubi[3]);
unsigned short *seed48(unsigned short seed16v[3]);
void srand48(long seedval);
```

DESCRIPTION

This family of functions shall generate pseudo-random numbers using a linear congruential algorithm and 48-bit integer arithmetic.

The *drand48*( ) and *erand48*( ) functions shall return non-negative, double-precision, floating-point values, uniformly distributed over the interval [0.0,1.0).

The *lrand48*( ) and *nrand48*( ) functions shall return non-negative, long integers, uniformly distributed over the interval $[0,2^{31})$.

The *mrand48*( ) and *jrand48*( ) functions shall return signed long integers uniformly distributed over the interval $[-2^{31},2^{31})$.

The *srand48*( ), *seed48*( ), and *lcong48*( ) are initialization entry points, one of which should be invoked before either *drand48*( ), *lrand48*( ), or *mrand48*( ) is called. (Although it is not recommended practice, constant default initializer values shall be supplied automatically if *drand48*( ), *lrand48*( ), or *mrand48*( ) is called without a prior call to an initialization entry point.) The *erand48*( ), *nrand48*( ), and *jrand48*( ) functions do not require an initialization entry point to be called first.

All the routines work by generating a sequence of 48-bit integer values, X_i, according to the linear congruential formula:

$$X_{n+1} = (aX_n + c)_{\mathrm{mod}\ m} \qquad n \geq 0$$

The parameter $m = 2^{48}$; hence 48-bit integer arithmetic is performed. Unless *lcong48*( ) is invoked, the multiplier value a and the addend value c are given by:

$$a = \mathrm{5DEECE66D}_{16} = 273673163155_{8}$$

$$c = \mathrm{B}_{16} = 13_{8}$$

The value returned by any of the *drand48*( ), *erand48*( ), *jrand48*( ), *lrand48*( ), *mrand48*( ), or *nrand48*( ) functions is computed by first generating the next 48-bit X_i in the sequence. Then the appropriate number of bits, according to the type of data item to be returned, are copied from the high-order (leftmost) bits of X_i and transformed into the returned value.

The *drand48*( ), *lrand48*( ), and *mrand48*( ) functions store the last 48-bit X_i generated in an internal buffer; that is why the application shall ensure that these are initialized prior to being invoked. The *erand48*( ), *nrand48*( ), and *jrand48*( ) functions require the calling program to provide storage for the successive X_i values in the array specified as an argument when the functions are invoked. That is why these routines do not have to be initialized; the calling program merely has to place the desired initial value of X_i into the array and pass it as an argument. By using different arguments, *erand48*( ), *nrand48*( ), and *jrand48*( ) allow separate modules of a large program to generate several *independent* streams of pseudo-random numbers; that is, the sequence of numbers in each stream shall *not* depend upon how many times the routines are called to generate numbers for the other streams.

The initializer function *srand48*( ) sets the high-order 32 bits of X_i to the low-order 32 bits contained in its argument. The low-order 16 bits of X_i are set to the arbitrary value $330E_{16}$.

The initializer function *seed48*( ) sets the value of X_i to the 48-bit value specified in the argument array. The low-order 16 bits of X_i are set to the low-order 16 bits of *seed16v*[*0*]. The mid-order 16 bits of X_i are set to the low-order 16 bits of *seed16v*[*1*]. The high-order 16 bits of X_i are set to the low-order 16 bits of *seed16v*[*2*]. In addition, the previous value of X_i is copied into a 48-bit internal buffer, used only by *seed48*( ), and a pointer to this buffer is the value returned by *seed48*( ). This returned pointer, which can just be ignored if not needed, is useful if a program is to be restarted from a given point at some future time—use the pointer to get at and store the last X_i value, and then use this value to reinitialize via *seed48*( ) when the program is restarted.

The initializer function *lcong48*( ) allows the user to specify the initial X_i, the multiplier value *a*, and the addend value *c*. Argument array elements *param*[*0-2*] specify X_i, *param*[*3-5*] specify the multiplier *a*, and *param*[*6*] specifies the 16-bit addend *c*. After *lcong48*( ) is called, a subsequent call to either *srand48*( ) or *seed48*( ) shall restore the standard multiplier and addend values, *a* and *c*, specified above.

The *drand48*( ), *lrand48*( ), and *mrand48*( ) functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

As described in the DESCRIPTION above.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

NAME

dup, dup2 — duplicate an open file descriptor

SYNOPSIS

```
#include <unistd.h>

int dup(int fildes);
int dup2(int fildes, int fildes2);
```

DESCRIPTION

The *dup*( ) and *dup2*( ) functions provide an alternative interface to the service provided by *fcntl*( ) using the F_DUPFD command. The call:

```
fid = dup(fildes);
```

shall be equivalent to:

```
fid = fcntl(fildes, F_DUPFD, 0);
```

The call:

```
fid = dup2(fildes, fildes2);
```

shall be equivalent to:

```
close(fildes2);
fid = fcntl(fildes, F_DUPFD, fildes2);
```

except for the following:

- If *fildes2* is less than 0 or greater than or equal to {OPEN_MAX}, *dup2*( ) shall return −1 with *errno* set to [EBADF].
- If *fildes* is a valid file descriptor and is equal to *fildes2*, *dup2*( ) shall return *fildes2* without closing it.
- If *fildes* is not a valid file descriptor, *dup2*( ) shall return −1 and shall not close *fildes2*.
- The value returned shall be equal to the value of *fildes2* upon successful completion, or −1 upon failure.

RETURN VALUE

Upon successful completion a non-negative integer, namely the file descriptor, shall be returned; otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *dup*( ) function shall fail if:

[EBADF]	The *fildes* argument is not a valid open file descriptor.
[EMFILE]	The number of file descriptors in use by this process would exceed {OPEN_MAX}.

The *dup2*( ) function shall fail if:

[EBADF]	The *fildes* argument is not a valid open file descriptor or the argument *fildes2* is negative or greater than or equal to {OPEN_MAX}.
[EINTR]	The *dup2*( ) function was interrupted by a signal.

EXAMPLES

Redirecting Standard Output to a File

The following example closes standard output for the current processes, re-assigns standard output to go to the file referenced by *pfd*, and closes the original file descriptor to clean up.

```
#include <unistd.h>
...
int pfd;
...
close(1);
dup(pfd);
close(pfd);
...
```

Redirecting Error Messages

The following example redirects messages from *stderr* to *stdout*.

```
#include <unistd.h>
...
dup2(1, 2);
...
```

APPLICATION USAGE

None.

RATIONALE

The *dup*( ) and *dup2*( ) functions are redundant. Their services are also provided by the *fcntl*( ) function. They have been included in this volume of IEEE Std 1003.1-200x primarily for historical reasons, since many existing applications use them.

While the brief code segment shown is very similar in behavior to *dup2*( ), a conforming implementation based on other functions defined in this volume of IEEE Std 1003.1-200x is significantly more complex. Least obvious is the possible effect of a signal-catching function that could be invoked between steps and allocate or deallocate file descriptors. This could be avoided by blocking signals.

The *dup2*( ) function is not marked obsolescent because it presents a type-safe version of functionality provided in a type-unsafe version by *fcntl*( ). It is used in the POSIX Ada binding.

The *dup2*( ) function is not intended for use in critical regions as a synchronization mechanism.

In the description of [EBADF], the case of *fildes* being out of range is covered by the given case of *fildes* not being valid. The descriptions for *fildes* and *fildes2* are different because the only kind of invalidity that is relevant for *fildes2* is whether it is out of range; that is, it does not matter whether *fildes2* refers to an open file when the *dup2*( ) call is made.

FUTURE DIRECTIONS

None.

Issue 6

The RATIONALE section is added.

NAME

ecvt, fcvt, gcvt — convert a floating-point number to a string (**LEGACY**)

SYNOPSIS

XSI

```
#include <stdlib.h>

char *ecvt(double value, int ndigit, int *restrict decpt,
    int *restrict sign);
char *fcvt(double value, int ndigit, int *restrict decpt,
    int *restrict sign);
char *gcvt(double value, int ndigit, char *buf);
```

DESCRIPTION

The *ecvt*( ), *fcvt*( ), and *gcvt*( ) functions shall convert floating-point numbers to null-terminated strings.

The *ecvt*( ) function shall convert *value* to a null-terminated string of *ndigit* digits (where *ndigit* is reduced to an unspecified limit determined by the precision of a **double**) and return a pointer to the string. The high-order digit shall be non-zero, unless the value is 0. The low-order digit shall be rounded in an implementation-defined manner. The position of the radix character relative to the beginning of the string shall be stored in the integer pointed to by *decpt* (negative means to the left of the returned digits). If *value* is zero, it is unspecified whether the integer pointed to by *decpt* would be 0 or 1. The radix character shall not be included in the returned string. If the sign of the result is negative, the integer pointed to by *sign* shall be non-zero; otherwise, it shall be 0.

If the converted value is out of range or is not representable, the contents of the returned string are unspecified.

The *fcvt*( ) function shall be equivalent to *ecvt*( ), except that *ndigit* specifies the number of digits desired after the radix character. The total number of digits in the result string is restricted to an unspecified limit as determined by the precision of a **double**.

The *gcvt*( ) function shall convert *value* to a null-terminated string (similar to that of the `%g` conversion specification format of *printf*( )) in the array pointed to by *buf* and shall return *buf*. It shall produce *ndigit* significant digits (limited to an unspecified value determined by the precision of a **double**) in the `%f` conversion specification format of *printf*( ) if possible, or the `%e` conversion specification format of *printf*( ) (scientific notation) otherwise. A minus sign shall be included in the returned string if *value* is less than 0. A radix character shall be included in the returned string if *value* is not a whole number. Trailing zeros shall be suppressed where *value* is not a whole number. The radix character is determined by the current locale. If *setlocale*( ) has not been called successfully, the default locale, POSIX, is used. The default locale specifies a period (`'.'`) as the radix character. The *LC_NUMERIC* category determines the value of the radix character within the current locale.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

The *ecvt*( ) and *fcvt*( ) functions shall return a pointer to a null-terminated string of digits.

The *gcvt*( ) function shall return *buf*.

The return values from *ecvt*( ) and *fcvt*( ) may point to static data which may be overwritten by subsequent calls to these functions.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

sprintf( ) is preferred over this function.

RATIONALE

None.

FUTURE DIRECTIONS

These functions may be withdrawn in a future version.

SEE ALSO

printf( ), *setlocale*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdlib.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

Issue 6

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

This function is marked LEGACY.

The **restrict** keyword is added to the *ecvt*( ) and *fcvt*( ) prototypes for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION is updated to explicitly use ‘‘conversion specification’’ to describe `%g`, `%f`, and `%e`.

NAME

encrypt — encoding function (**CRYPT**)

SYNOPSIS

XSI

```
#include <unistd.h>

void encrypt(char block[64], int edflag);
```

DESCRIPTION

The *encrypt*( ) function shall provide access to an implementation-defined encoding algorithm. The key generated by *setkey*( ) is used to encrypt the string *block* with *encrypt*( ).

The *block* argument to *encrypt*( ) shall be an array of length 64 bytes containing only the bytes with values of 0 and 1. The array is modified in place to a similar array using the key set by *setkey*( ). If *edflag* is 0, the argument is encoded. If *edflag* is 1, the argument may be decoded (see the APPLICATION USAGE section); if the argument is not decoded, *errno* shall be set to [ENOSYS].

The *encrypt*( ) function shall not change the setting of *errno* if successful. An application wishing to check for error situations should set *errno* to 0 before calling *encrypt*( ). If *errno* is non-zero on return, an error has occurred.

The *encrypt*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

The *encrypt*( ) function shall not return a value.

ERRORS

The *encrypt*( ) function shall fail if:

[ENOSYS] The functionality is not supported on this implementation.

EXAMPLES

None.

APPLICATION USAGE

Historical implementations of the *encrypt*( ) function used a rather primitive encoding algorithm.

In some environments, decoding might not be implemented. This is related to some Government restrictions on encryption and decryption routines. Historical practice has been to ship a different version of the encryption library without the decryption feature in the routines supplied. Thus the exported version of *encrypt*( ) does encoding but not decoding.

RATIONALE

None.

FUTURE DIRECTIONS

NAME

endgrent, getgrent, setgrent — group database entry functions

SYNOPSIS

XSI
```
#include <grp.h>

void endgrent(void);
struct group *getgrent(void);
void setgrent(void);
```

DESCRIPTION

The *getgrent*( ) function shall return a pointer to a structure containing the broken-out fields of an entry in the group database. When first called, *getgrent*( ) shall return a pointer to a **group** structure containing the first entry in the group database. Thereafter, it shall return a pointer to a **group** structure containing the next group structure in the group database, so successive calls may be used to search the entire database.

An implementation that provides extended security controls may impose further implementation-defined restrictions on accessing the group database. In particular, the system may deny the existence of some or all of the group database entries associated with groups other than those groups associated with the caller and may omit users other than the caller from the list of members of groups in database entries that are returned.

The *setgrent*( ) function shall rewind the group database to allow repeated searches. |

The *endgrent*( ) function may be called to close the group database when processing is complete.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

When first called, *getgrent*( ) shall return a pointer to the first group structure in the group database. Upon subsequent calls it shall return the next group structure in the group database. The *getgrent*( ) function shall return a null pointer on end-of-file or an error and *errno* may be set to indicate the error.

The return value may point to a static area which is overwritten by a subsequent call to *getgrgid*( ), *getgrnam*( ), or *getgrent*( ).

ERRORS

The *getgrent*( ) function may fail if:

[EINTR]	A signal was caught during the operation.
[EIO]	An I/O error has occurred.
[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
[ENFILE]	The maximum allowable number of files is currently open in the system.

EXAMPLES

None.

APPLICATION USAGE

These functions are provided due to their historical usage. Applications should avoid dependencies on fields in the group database, whether the database is a single file, or where in the file system name space the database resides. Applications should use *getgrnam*( ) and *getgrgid*( ) whenever possible because it avoids these dependencies.

RATIONALE

None.

FUTURE DIRECTIONS

NAME

endhostent, gethostent, sethostent — network host database functions

SYNOPSIS

```
#include <netdb.h>

void endhostent(void);
struct hostent *gethostent(void);
void sethostent(int stayopen);
```

DESCRIPTION

These functions shall retrieve information about hosts. This information is considered to be stored in a database that can be accessed sequentially or randomly. The implementation of this database is unspecified.

Note: In many cases it is implemented by the Domain Name System, as documented in RFC 1034, RFC 1035, and RFC 1886.

The *sethostent*( ) function shall open a connection to the database and set the next entry for retrieval to the first entry in the database. If the *stayopen* argument is non-zero, the connection shall not be closed by a call to *gethostent*( ), *gethostbyname*( ), or *gethostbyaddr*( ), and the implementation may maintain an open file descriptor.

The *gethostent*( ) function shall read the next entry in the database, opening and closing a connection to the database as necessary.

Entries shall be returned in **hostent** structures. Refer to *gethostbyaddr*( ) for a definition of the **hostent** structure.

The *endhostent*( ) function shall close the connection to the database, releasing any open file descriptor.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, the *gethostent*( ) function shall return a pointer to a **hostent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found.

ERRORS

No errors are defined for *endhostent*( ), *gethostent*( ), and *sethostent*( ).

EXAMPLES

None.

APPLICATION USAGE

The *gethostent*( ) function may return pointers to static data, which may be overwritten by subsequent calls to any of these functions.

RATIONALE

None.

FUTURE DIRECTIONS

NAME

endnetent, getnetbyaddr, getnetbyname, getnetent, setnetent — network database functions

SYNOPSIS

```
#include <netdb.h>

void endnetent(void);
struct netent *getnetbyaddr(uint32_t net, int type);
struct netent *getnetbyname(const char *name);
struct netent *getnetent(void);
void setnetent(int stayopen);
```

DESCRIPTION

These functions shall retrieve information about networks. This information is considered to be stored in a database that can be accessed sequentially or randomly. The implementation of this database is unspecified.

The *setnetent*( ) function shall open and rewind the database. If the *stayopen* argument is non-zero, the connection to the *net* database shall not be closed after each call to *getnetent*( ) (either directly, or indirectly through one of the other *getnet**( ) functions), and the implementation may maintain an open file descriptor to the database.

The *getnetent*( ) function shall read the next entry of the database, opening and closing a connection to the database as necessary.

The *getnetbyaddr*( ) function shall search the database from the beginning, and find the first entry for which the address family specified by *type* matches the *n_addrtype* member and the network number *net* matches the *n_net* member, opening and closing a connection to the database as necessary. The *net* argument shall be the network number in host byte order.

The *getnetbyname*( ) function shall search the database from the beginning and find the first entry for which the network name specified by *name* matches the *n_name* member, opening and closing a connection to the database as necessary.

The *getnetbyaddr*( ), *getnetbyname*( ), and *getnetent*( ), functions shall each return a pointer to a **netent** structure, the members of which shall contain the fields of an entry in the network database.

The *endnetent*( ) function shall close the database, releasing any open file descriptor.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *getnetbyaddr*( ), *getnetbyname*( ), and *getnetent*( ), shall return a pointer to a **netent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found. Otherwise, a null pointer shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *getnetbyaddr*( ), *getnetbyname*( ), and *getnetent*( ), functions may return pointers to static data, which may be overwritten by subsequent calls to any of these functions.

NAME

endprotoent, getprotobyname, getprotobynumber, getprotoent, setprotoent — network protocol database functions

SYNOPSIS

```
#include <netdb.h>

void endprotoent(void);
struct protoent *getprotobyname(const char *name);
struct protoent *getprotobynumber(int proto);
struct protoent *getprotoent(void);
void setprotoent(int stayopen);
```

DESCRIPTION

These functions shall retrieve information about protocols. This information is considered to be stored in a database that can be accessed sequentially or randomly. The implementation of this database is unspecified.

The *setprotoent*( ) function shall open a connection to the database, and set the next entry to the first entry. If the *stayopen* argument is non-zero, the connection to the network protocol database shall not be closed after each call to *getprotoent*( ) (either directly, or indirectly through one of the other *getproto**( ) functions), and the implementation may maintain an open file descriptor for the database.

The *getprotobyname*( ) function shall search the database from the beginning and find the first entry for which the protocol name specified by *name* matches the *p_name* member, opening and closing a connection to the database as necessary.

The *getprotobynumber*( ) function shall search the database from the beginning and find the first entry for which the protocol number specified by *proto* matches the *p_proto* member, opening and closing a connection to the database as necessary.

The *getprotoent*( ) function shall read the next entry of the database, opening and closing a connection to the database as necessary.

The *getprotobyname*( ), *getprotobynumber*( ), and *getprotoent*( ), functions shall each return a pointer to a **protoent** structure, the members of which shall contain the fields of an entry in the network protocol database.

The *endprotoent*( ) function shall close the connection to the database, releasing any open file descriptor.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *getprotobyname*( ), *getprotobynumber*( ), and *getprotoent*( ) return a pointer to a **protoent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found. Otherwise, a null pointer is returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *getprotobyname*( ), *getprotobynumber*( ), and *getprotoent*( ) functions may return pointers to static data, which may be overwritten by subsequent calls to any of these functions.

NAME

endpwent, getpwent, setpwent — user database functions

SYNOPSIS

XSI
```
#include <pwd.h>

void endpwent(void);
struct passwd *getpwent(void);
void setpwent(void);
```

DESCRIPTION

These functions shall retrieve information about users.

The *getpwent*( ) function shall return a pointer to a structure containing the broken-out fields of an entry in the user database. Each entry in the user database contains a **passwd** structure. When first called, *getpwent*( ) shall return a pointer to a **passwd** structure containing the first entry in the user database. Thereafter, it shall return a pointer to a **passwd** structure containing the next entry in the user database. Successive calls can be used to search the entire user database.

If an end-of-file or an error is encountered on reading, *getpwent*( ) shall return a null pointer.

An implementation that provides extended security controls may impose further implementation-defined restrictions on accessing the user database. In particular, the system may deny the existence of some or all of the user database entries associated with users other than the caller.

The *setpwent*( ) function effectively rewinds the user database to allow repeated searches.

The *endpwent*( ) function may be called to close the user database when processing is complete.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

The *getpwent*( ) function shall return a null pointer on end-of-file or error.

ERRORS

The *getpwent*( ), *setpwent*( ), and *endpwent*( ) functions may fail if:

[EIO]	An I/O error has occurred.

In addition, *getpwent*( ) and *setpwent*( ) may fail if:

[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
[ENFILE]	The maximum allowable number of files is currently open in the system.

The return value may point to a static area which is overwritten by a subsequent call to *getpwuid*( ), *getpwnam*( ), or *getpwent*( ).

EXAMPLES

Searching the User Database

The following example uses the *getpwent*( ) function to get successive entries in the user database, returning a pointer to a **passwd** structure that contains information about each user. The call to *endpwent*( ) closes the user database and cleans up.

```
#include <pwd.h>
...
struct passwd *p;
...
while ((p = getpwent ()) != NULL) {
...
}

endpwent();
...
```

APPLICATION USAGE

These functions are provided due to their historical usage. Applications should avoid dependencies on fields in the password database, whether the database is a single file, or where in the file system name space the database resides. Applications should use *getpwuid*( ) whenever possible because it avoids these dependencies.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 6

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

NAME

endservent, getservbyname, getservbyport, getservent, setservent — network services database functions

SYNOPSIS

```
#include <netdb.h>

void endservent(void);
struct servent *getservbyname(const char *name, const char *proto);
struct servent *getservbyport(int port, const char *proto);
struct servent *getservent(void);
void setservent(int stayopen);
```

DESCRIPTION

These functions shall retrieve information about network services. This information is considered to be stored in a database that can be accessed sequentially or randomly. The implementation of this database is unspecified.

The *setservent*( ) function shall open a connection to the database, and set the next entry to the first entry. If the *stayopen* argument is non-zero, the *net* database shall not be closed after each call to the *getservent*( ) function (either directly, or indirectly through one of the other *getserv**( ) functions), and the implementation may maintain an open file descriptor for the database.

The *getservent*( ) function shall read the next entry of the database, opening and closing a connection to the database as necessary.

The *getservbyname*( ) function shall search the database from the beginning and find the first entry for which the service name specified by *name* matches the *s_name* member and the protocol name specified by *proto* matches the *s_proto* member, opening and closing a connection to the database as necessary. If *proto* is a null pointer, any value of the *s_proto* member shall be matched.

The *getservbyport*( ) function shall search the database from the beginning and find the first entry for which the port specified by *port* matches the *s_port* member and the protocol name specified by *proto* matches the *s_proto* member, opening and closing a connection to the database as necessary. If *proto* is a null pointer, any value of the *s_proto* member shall be matched. The *port* argument shall be in network byte order.

The *getservbyname*( ), *getservbyport*( ), and *getservent*( ) functions shall each return a pointer to a **servent** structure, the members of which shall contain the fields of an entry in the network services database.

The *endservent*( ) function shall close the database, releasing any open file descriptor.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *getservbyname*( ), *getservbyport*( ), and *getservent*( ) return a pointer to a **servent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found. Otherwise, a null pointer is returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *port* argument of *getservbyport*( ) need not be compatible with the port values of all address families.

The *getservbyname*( ), *getservbyport*( ), and *getservent*( ) functions may return pointers to static data, which may be overwritten by subsequent calls to any of these functions.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

endutxent, getutxent, getutxid, getutxline, pututxline, setutxent — user accounting database functions

SYNOPSIS

XSI
```
#include <utmpx.h>

void endutxent(void);
struct utmpx *getutxent(void);
struct utmpx *getutxid(const struct utmpx *id);
struct utmpx *getutxline(const struct utmpx *line);
struct utmpx *pututxline(const struct utmpx *utmpx);
void setutxent(void);
```

DESCRIPTION

These functions shall provide access to the user accounting database.

The *getutxent*( ) function shall read the next entry from the user accounting database. If the database is not already open, it shall open it. If it reaches the end of the database, it shall fail.

The *getutxid*( ) function shall search forward from the current point in the database. If the *ut_type* value of the **utmpx** structure pointed to by *id* is BOOT_TIME, OLD_TIME, or NEW_TIME, then it shall stop when it finds an entry with a matching *ut_type* value. If the *ut_type* value is INIT_PROCESS, LOGIN_PROCESS, USER_PROCESS, or DEAD_PROCESS, then it shall stop when it finds an entry whose type is one of these four and whose *ut_id* member matches the *ut_id* member of the **utmpx** structure pointed to by *id*. If the end of the database is reached without a match, *getutxid*( ) shall fail.

The *getutxline*( ) function shall search forward from the current point in the database until it finds an entry of the type LOGIN_PROCESS or USER_PROCESS which also has a *ut_line* value matching that in the **utmpx** structure pointed to by *line*. If the end of the database is reached without a match, *getutxline*( ) shall fail.

The *getutxid*( ) or *getutxline*( ) function may cache data. For this reason, to use *getutxline*( ) to search for multiple occurrences, the application shall zero out the static data after each success, or *getutxline*( ) may return a pointer to the same **utmpx** structure.

There is one exception to the rule about clearing the structure before further reads are done. The implicit read done by *pututxline*( ) (if it finds that it is not already at the correct place in the user accounting database) shall not modify the static structure returned by *getutxent*( ), *getutxid*( ), or *getutxline*( ), if the application has modified this structure and passed the pointer back to *pututxline*( ).

For all entries that match a request, the *ut_type* member indicates the type of the entry. Other members of the entry shall contain meaningful data based on the value of the *ut_type* member as follows:

ut_type Member	Other Members with Meaningful Data
EMPTY	No others
BOOT_TIME	*ut_tv*
OLD_TIME	*ut_tv*
NEW_TIME	*ut_tv*
USER_PROCESS	*ut_id*, *ut_user* (login name of the user), *ut_line*, *ut_pid*, *ut_tv*
INIT_PROCESS	*ut_id*, *ut_pid*, *ut_tv*
LOGIN_PROCESS	*ut_id*, *ut_user* (implementation-defined name of the login process), *ut_pid*, *ut_tv*
DEAD_PROCESS	*ut_id*, *ut_pid*, *ut_tv*

An implementation that provides extended security controls may impose implementation-defined restrictions on accessing the user accounting database. In particular, the system may deny the existence of some or all of the user accounting database entries associated with users other than the caller.

If the process has appropriate privileges, the *pututxline*( ) function shall write out the structure into the user accounting database. It shall use *getutxid*( ) to search for a record that satisfies the request. If this search succeeds, then the entry shall be replaced. Otherwise, a new entry shall be made at the end of the user accounting database.

The *endutxent*( ) function shall close the user accounting database.

The *setutxent*( ) function shall reset the input to the beginning of the database. This should be done before each search for a new entry if it is desired that the entire database be examined.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *getutxent*( ), *getutxid*( ), and *getutxline*( ) shall return a pointer to a **utmpx** structure containing a copy of the requested entry in the user accounting database. Otherwise, a null pointer shall be returned.

The return value may point to a static area which is overwritten by a subsequent call to *getutxid*( ) or *getutxline*( ).

Upon successful completion, *pututxline*( ) shall return a pointer to a **utmpx** structure containing a copy of the entry added to the user accounting database. Otherwise, a null pointer shall be returned.

The *endutxent*( ) and *setutxent*( ) functions shall not return a value.

ERRORS

No errors are defined for the *endutxent*( ), *getutxent*( ), *getutxid*( ), *getutxline*( ), and *setutxent*( ) functions.

The *pututxline*( ) function may fail if:

[EPERM]	The process does not have appropriate privileges.

EXAMPLES

None.

APPLICATION USAGE

The sizes of the arrays in the structure can be found using the *sizeof* operator.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

Issue 6

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

NAME

environ — array of character pointers to the environment strings

SYNOPSIS

```
extern char **environ;
```

DESCRIPTION

Refer to the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 8, Environment Variables and *exec*.

NAME

erand48 — generate uniformly distributed pseudo-random numbers

SYNOPSIS

XSI
```
#include <stdlib.h>

double erand48(unsigned short xsubi[3]);
```

DESCRIPTION

Refer to *drand48*( ).

NAME

erf, erff, erfl — error functions

SYNOPSIS

```
#include <math.h>

double erf(double x);
float erff(float x);
long double erfl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the error function of their argument *x*, defined as:

$$\frac{2}{\sqrt{\pi}}\int_0^x e^{-t^2}\,dt$$

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the value of the error function.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, ±0 shall be returned.

If *x* is ±Inf, ±1 shall be returned.

If *x* is subnormal, a range error may occur, and 2 * *x* /*sqrt*(π) should be returned.

ERRORS

These functions may fail if:

MX	Range Error	The result underflows. If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

Underflow occurs when |*x*| < DBL_MIN * (*sqrt*(π) / 2).

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

erfc( ), *feclearexcept*( ), *fetestexcept*( ), *isnan*( ), the Base Definitions volume of IEEE Std 1003.1-200x, Section 4.18, Treatment of Error Conditions for Mathematical Functions, **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *erf*( ) function is no longer marked as an extension.

The *erfc*( ) function is now split out onto its own reference page.

The *erff*( ) and *erfl*( ) functions are added for alignment with the ISO / IEC 9899: 1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO / IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO / IEC 9899: 1999 standard are marked.

NAME

erfc, erfcf, erfcl — complementary error functions

SYNOPSIS

```
#include <math.h>

double erfc(double x);
float erfcf(float x);
long double erfcl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the complementary error function 1.0 – *erf*(*x*).

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the value of the complementary error function.

If the correct value would cause underflow and is not representable, a range error may occur and MX either 0.0 (if representable), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, +1 shall be returned.

If *x* is –Inf, +2 shall be returned.

If *x* is +Inf, +0 shall be returned.

If the correct value would cause underflow and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions may fail if:

Range Error	The result underflows. If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

The *erfc*( ) function is provided because of the extreme loss of relative accuracy if *erf*(*x*) is called for large *x* and the result subtracted from 1.0.

Note for IEEE Std 754-1985 **double**, 26.55 < *x* implies *erfc*(*x*) has underflowed.

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *erfc*( ) function is no longer marked as an extension.

These functions are split out from the *erf*( ) reference page.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

erff, erfl — error functions

SYNOPSIS

```
#include <math.h>

float erff(float x);
long double erfl(long double x);
```

DESCRIPTION

Refer to *erf*( ).

NAME

errno — error return value

SYNOPSIS

```
#include <errno.h>
```

DESCRIPTION

The lvalue *errno* is used by many functions to return error values.

Many functions provide an error number in *errno*. It has type **int** and is defined in **<errno.h>**. The value of *errno* shall be defined only after a call to a function for which it is explicitly stated to be set and until it is changed by the next function call or if the application assigns it a value. The value of *errno* should only be examined when it is indicated to be valid by a function's return value. Applications shall obtain the definition of *errno* by the inclusion of **<errno.h>**. No function in this volume of IEEE Std 1003.1-200x shall set *errno* to 0.

It is unspecified whether *errno* is a macro or an identifier declared with external linkage. If a macro definition is suppressed in order to access an actual object, or a program defines an identifier with the name *errno*, the behavior is undefined.

The symbolic values stored in *errno* are documented in the ERRORS sections on all relevant pages.

RETURN VALUE

None.

ERRORS

None.

EXAMPLES

None.

APPLICATION USAGE

Previously both POSIX and X/Open documents were more restrictive than the ISO C standard in that they required *errno* to be defined as an external variable, whereas the ISO C standard required only that *errno* be defined as a modifiable lvalue with type **int**.

A program that uses *errno* for error checking should set it to 0 before a function call, then inspect it before a subsequent function call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

Section 2.3, the Base Definitions volume of IEEE Std 1003.1-200x, **<errno.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The following sentence is deleted from the DESCRIPTION: ‘‘The value of *errno* is 0 at program start-up, but is never set to 0 by any XSI function’’. The DESCRIPTION also no longer states that conforming implementations may support the declaration:

```
extern int errno;
```

Issue 6

Obsolescent text regarding defining *errno* as:

```
extern int errno
```

is removed.

Text regarding no function setting *errno* to zero to indicate an error is changed to no function shall set *errno* to zero. This is for alignment with the ISO / IEC 9899: 1999 standard.

NAME

environ, execl, execv, execle, execve, execlp, execvp — execute a file

SYNOPSIS

```
#include <unistd.h>

extern char **environ;
int execl(const char *path, const char *arg0, ... /*, (char *)0 */);
int execv(const char *path, char *const argv[]);
int execle(const char *path, const char *arg0, ... /*,
    (char *)0, char *const envp[]*/);
int execve(const char *path, char *const argv[], char *const envp[]);
int execlp(const char *file, const char *arg0, ... /*, (char *)0 */);
int execvp(const char *file, char *const argv[]);
```

DESCRIPTION

The *exec* family of functions shall replace the current process image with a new process image. The new image shall be constructed from a regular, executable file called the *new process image file*. There shall be no return from a successful *exec*, because the calling process image is overlaid by the new process image.

When a C-language program is executed as a result of this call, it shall be entered as a C-language function call as follows:

```
int main (int argc, char *argv[]);
```

where *argc* is the argument count and *argv* is an array of character pointers to the arguments themselves. In addition, the following variable:

```
extern char **environ;
```

is initialized as a pointer to an array of character pointers to the environment strings. The *argv* and *environ* arrays are each terminated by a null pointer. The null pointer terminating the *argv* array is not counted in *argc*.

THR Conforming multi-threaded applications shall not use the *environ* variable to access or modify any environment variable while any other thread is concurrently modifying any environment variable. A call to any function dependent on any environment variable shall be considered a use of the *environ* variable to access that environment variable.

The arguments specified by a program with one of the *exec* functions shall be passed on to the new process image in the corresponding *main*( ) arguments.

The argument *path* points to a pathname that identifies the new process image file.

The argument *file* is used to construct a pathname that identifies the new process image file. If the *file* argument contains a slash character, the *file* argument shall be used as the pathname for this file. Otherwise, the path prefix for this file is obtained by a search of the directories passed as the environment variable *PATH* (see the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 8, Environment Variables). If this environment variable is not present, the results of the search are implementation-defined.

If the process image file is not a valid executable object, and the system does not recognize it as something that cannot be executed (and thus returns [EINVAL]), *execlp*( ) and *execvp*( ) shall use the contents of that file as standard input to a command interpreter conforming to *system*( ). In this case, the command interpreter becomes the new process image.

The arguments represented by *arg0*,... are pointers to null-terminated character strings. These strings shall constitute the argument list available to the new process image. The list is terminated by a null pointer. The argument *arg0* should point to a filename that is associated with the process being started by one of the *exec* functions.

The argument *argv* is an array of character pointers to null-terminated strings. The application shall ensure that the last member of this array is a null pointer. These strings shall constitute the argument list available to the new process image. The value in *argv*[0] should point to a filename that is associated with the process being started by one of the *exec* functions.

The argument *envp* is an array of character pointers to null-terminated strings. These strings shall constitute the environment for the new process image. The *envp* array is terminated by a null pointer.

For those forms not containing an *envp* pointer (*execl*( ), *execv*( ), *execlp*( ), and *execvp*( )), the environment for the new process image shall be taken from the external variable *environ* in the calling process.

The number of bytes available for the new process' combined argument and environment lists is {ARG_MAX}. It is implementation-defined whether null terminators, pointers, and/or any alignment bytes are included in this total.

File descriptors open in the calling process image shall remain open in the new process image, except for those whose close-on-exec flag FD_CLOEXEC is set. For those file descriptors that remain open, all attributes of the open file description remain unchanged. For any file descriptor that is closed for this reason, file locks are removed as a result of the close as described in *close*( ). Locks that are not removed by closing of file descriptors remain unchanged.

Directory streams open in the calling process image shall be closed in the new process image.

The state of the floating-point environment in the new process image shall be set to the default.

XSI The state of conversion descriptors and message catalog descriptors in the new process image is undefined. For the new process image, the equivalent of:

```
setlocale(LC_ALL, "C")
```

shall be executed at start-up.

Signals set to the default action (SIG_DFL) in the calling process image shall be set to the default action in the new process image. Except for SIGCHLD, signals set to be ignored (SIG_IGN) by the calling process image shall be set to be ignored by the new process image. Signals set to be caught by the calling process image shall be set to the default action in the new process image (see **<signal.h>**). If the SIGCHLD signal is set to be ignored by the calling process image, it is unspecified whether the SIGCHLD signal is set to be ignored or to the default action in the new process image. XSI After a successful call to any of the *exec* functions, alternate signal stacks are not preserved and the SA_ONSTACK flag shall be cleared for all signals.

After a successful call to any of the *exec* functions, any functions previously registered by *atexit*( ) are no longer registered.

XSI If the ST_NOSUID bit is set for the file system containing the new process image file, then the effective user ID, effective group ID, saved set-user-ID, and saved set-group-ID are unchanged in the new process image. Otherwise, if the set-user-ID mode bit of the new process image file is set, the effective user ID of the new process image shall be set to the user ID of the new process image file. Similarly, if the set-group-ID mode bit of the new process image file is set, the effective group ID of the new process image shall be set to the group ID of the new process image file. The real user ID, real group ID, and supplementary group IDs of the new process image shall remain the same as those of the calling process image. The effective user ID and effective group ID of the new process image shall be saved (as the saved set-user-ID and the saved set-group-ID) for use by *setuid*( ).

XSI Any shared memory segments attached to the calling process image shall not be attached to the new process image.

SEM Any named semaphores open in the calling process shall be closed as if by appropriate calls to *sem_close*( ).

TYM Any blocks of typed memory that were mapped in the calling process are unmapped, as if *munmap*( ) was implicitly called to unmap them.

ML Memory locks established by the calling process via calls to *mlockall*( ) or *mlock*( ) shall be removed. If locked pages in the address space of the calling process are also mapped into the address spaces of other processes and are locked by those processes, the locks established by the other processes shall be unaffected by the call by this process to the *exec* function. If the *exec* function fails, the effect on memory locks is unspecified.

MF|SHM Memory mappings created in the process are unmapped before the address space is rebuilt for the new process image.

PS For the SCHED_FIFO and SCHED_RR scheduling policies, the policy and priority settings shall not be changed by a call to an *exec* function. For other scheduling policies, the policy and priority settings on *exec* are implementation-defined.

TMR Per-process timers created by the calling process shall be deleted before replacing the current process image with the new process image.

MSG All open message queue descriptors in the calling process shall be closed, as described in *mq_close*( ).

AIO Any outstanding asynchronous I/O operations may be canceled. Those asynchronous I/O operations that are not canceled shall complete as if the *exec* function had not yet occurred, but any associated signal notifications shall be suppressed. It is unspecified whether the *exec* function itself blocks awaiting such I/O completion. In no event, however, shall the new process image created by the *exec* function be affected by the presence of outstanding asynchronous I/O operations at the time the *exec* function is called. Whether any I/O is canceled, and which I/O may be canceled upon *exec*, is implementation-defined.

CPT The new process image shall inherit the CPU-time clock of the calling process image. This inheritance means that the process CPU-time clock of the process being *exec*ed shall not be reinitialized or altered as a result of the *exec* function other than to reflect the time spent by the process executing the *exec* function itself.

TCT The initial value of the CPU-time clock of the initial thread of the new process image shall be set to zero.

TRC If the calling process is being traced, the new process image shall continue to be traced into the same trace stream as the original process image, but the new process image shall not inherit the mapping of trace event names to trace event type identifiers that was defined by calls to the *posix_trace_eventid_open*( ) or the *posix_trace_trid_eventid_open*( ) functions in the calling process image.

If the calling process is a trace controller process, any trace streams that were created by the calling process shall be shut down as described in the *posix_trace_shutdown*( ) function.

The new process shall inherit at least the following attributes from the calling process image:

- XSI Nice value (see *nice*( ))
- XSI *semadj* values (see *semop*( ))

- Process ID
- Parent process ID
- Process group ID
- Session membership
- Real user ID
- Real group ID
- Supplementary group IDs
- Time left until an alarm clock signal (see *alarm*( ))
- Current working directory
- Root directory
- File mode creation mask (see *umask*( ))
- XSI File size limit (see *ulimit*( ))
- Process signal mask (see *sigprocmask*( ))
- Pending signal (see *sigpending*( ))
- *tms_utime*, *tms_stime*, *tms_cutime*, and *tms_cstime* (see *times*( ))
- XSI Resource limits
- XSI Controlling terminal
- XSI Interval timers

All other process attributes defined in this volume of IEEE Std 1003.1-200x shall be the same in the new and old process images. The inheritance of process attributes not defined by this volume of IEEE Std 1003.1-200x is implementation-defined.

A call to any *exec* function from a process with more than one thread shall result in all threads being terminated and the new executable image being loaded and executed. No destructor functions shall be called.

Upon successful completion, the *exec* functions shall mark for update the *st_atime* field of the file. If an *exec* function failed but was able to locate the *process image file*, whether the *st_atime* field is marked for update is unspecified. Should the *exec* function succeed, the process image file shall be considered to have been opened with *open*( ). The corresponding *close*( ) shall be considered to occur at a time after this open, but before process termination or successful completion of a subsequent call to one of the *exec* functions, *posix_spawn*( ), or *posix_spawnp*( ). The *argv*[ ] and *envp*[ ] arrays of pointers and the strings to which those arrays point shall not be modified by a call to one of the *exec* functions, except as a consequence of replacing the process image.

XSI The saved resource limits in the new process image are set to be a copy of the process' corresponding hard and soft limits.

RETURN VALUE

If one of the *exec* functions returns to the calling process image, an error has occurred; the return value shall be −1, and *errno* shall be set to indicate the error.

ERRORS

The *exec* functions shall fail if:

[E2BIG]	The number of bytes used by the new process image's argument list and environment list is greater than the system-imposed limit of {ARG_MAX} bytes.
[EACCES]	Search permission is denied for a directory listed in the new process image file's path prefix, or the new process image file denies execution permission, or the new process image file is not a regular file and the implementation does not support execution of files of its type.
[EINVAL]	The new process image file has the appropriate permission and has a recognized executable binary format, but the system does not support execution of a file with this format.
[ELOOP]	A loop exists in symbolic links encountered during resolution of the *path* or *file* argument.
[ENAMETOOLONG]	The length of the *path* or *file* arguments exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
[ENOENT]	A component of *path* or *file* does not name an existing file or *path* or *file* is an empty string.
[ENOTDIR]	A component of the new process image file's path prefix is not a directory.

The *exec* functions, except for *execlp*( ) and *execvp*( ), shall fail if:

[ENOEXEC]	The new process image file has the appropriate access permission but has an unrecognized format.

The *exec* functions may fail if:

[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* or *file* argument.
[ENAMETOOLONG]	As a result of encountering a symbolic link in resolution of the *path* argument, the length of the substituted pathname string exceeded {PATH_MAX}.
[ENOMEM]	The new process image requires more memory than is allowed by the hardware or system-imposed memory management constraints.
[ETXTBSY]	The new process image file is a pure procedure (shared text) file that is currently open for writing by some process.

EXAMPLES

Using execl( )

The following example executes the *ls* command, specifying the pathname of the executable (**/bin/ls**) and using arguments supplied directly to the command to produce single-column output.

```
#include <unistd.h>

int ret;
...
ret = execl ("/bin/ls", "ls", "-1", (char *)0);
```

Using execle()

The following example is similar to **Using execl()** (on page 758). In addition, it specifies the environment for the new process image using the *env* argument.

```
#include <unistd.h>

int ret;
char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
...
ret = execle ("/bin/ls", "ls", "-l", (char *)0, env);
```

Using execlp()

The following example searches for the location of the *ls* command among the directories specified by the *PATH* environment variable.

```
#include <unistd.h>

int ret;
...
ret = execlp ("ls", "ls", "-l", (char *)0);
```

Using execv()

The following example passes arguments to the *ls* command in the *cmd* array.

```
#include <unistd.h>

int ret;
char *cmd[] = { "ls", "-l", (char *)0 };
...
ret = execv ("/bin/ls", cmd);
```

Using execve()

The following example passes arguments to the *ls* command in the *cmd* array, and specifies the environment for the new process image using the *env* argument.

```
#include <unistd.h>

int ret;
char *cmd[] = { "ls", "-l", (char *)0 };
char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
...
ret = execve ("/bin/ls", cmd, env);
```

Using execvp()

The following example searches for the location of the *ls* command among the directories specified by the *PATH* environment variable, and passes arguments to the *ls* command in the *cmd* array.

```
#include <unistd.h>

int ret;
char *cmd[] = { "ls", "-l", (char *)0 };
...
```

```
        ret = execvp ("ls", cmd);
```

APPLICATION USAGE

As the state of conversion descriptors and message catalog descriptors in the new process image is undefined, conforming applications should not rely on their use and should close them prior to calling one of the *exec* functions. |

Applications that require other than the default POSIX locale should call *setlocale*( ) with the appropriate parameters to establish the locale of the new process.

The *environ* array should not be accessed directly by the application.

RATIONALE

Early proposals required that the value of *argc* passed to *main*( ) be ''one or greater''. This was driven by the same requirement in drafts of the ISO C standard. In fact, historical implementations have passed a value of zero when no arguments are supplied to the caller of the *exec* functions. This requirement was removed from the ISO C standard and subsequently removed from this volume of IEEE Std 1003.1-200x as well. The wording, in particular the use of the word *should*, requires a Strictly Conforming POSIX Application to pass at least one argument to the *exec* function, thus guaranteeing that *argc* be one or greater when invoked by such an application. In fact, this is good practice, since many existing applications reference *argv*[0] without first checking the value of *argc*.

The requirement on a Strictly Conforming POSIX Application also states that the value passed as the first argument be a filename associated with the process being started. Although some existing applications pass a pathname rather than a filename in some circumstances, a filename is more generally useful, since the common usage of *argv*[0] is in printing diagnostics. In some cases the filename passed is not the actual filename of the file; for example, many implementations of the *login* utility use a convention of prefixing a hyphen ('−') to the actual filename, which indicates to the command interpreter being invoked that it is a ''login shell''. |

Some implementations can *exec* shell scripts. |

One common historical implementation is that the *execl*( ), *execv*( ), *execle*( ), and *execve*( ) functions return an [ENOEXEC] error for any file not recognizable as executable, including a shell script. When the *execlp*( ) and *execvp*( ) functions encounter such a file, they assume the file to be a shell script and invoke a known command interpreter to interpret such files. These implementations of *execvp*( ) and *execlp*( ) only give the [ENOEXEC] error in the rare case of a problem with the command interpreter's executable file. Because of these implementations, the [ENOEXEC] error is not mentioned for *execlp*( ) or *execvp*( ), although implementations can still give it.

Another way that some historical implementations handle shell scripts is by recognizing the first two bytes of the file as the character string `"#!"` and using the remainder of the first line of the file as the name of the command interpreter to execute.

Some implementations provide a third argument to *main*( ) called *envp*. This is defined as a pointer to the environment. The ISO C standard specifies invoking *main*( ) with two arguments, so implementations must support applications written this way. Since this volume of IEEE Std 1003.1-200x defines the global variable *environ*, which is also provided by historical implementations and can be used anywhere that *envp* could be used, there is no functional need for the *envp* argument. Applications should use the *getenv*( ) function rather than accessing the environment directly via either *envp* or *environ*. Implementations are required to support the two-argument calling sequence, but this does not prohibit an implementation from supporting *envp* as an optional third argument.

This volume of IEEE Std 1003.1-200x specifies that signals set to SIG_IGN remain set to SIG_IGN, and that the process signal mask be unchanged across an *exec*. This is consistent with historical implementations, and it permits some useful functionality, such as the *nohup* command. However, it should be noted that many existing applications wrongly assume that they start with certain signals set to the default action and/or unblocked. In particular, applications written with a simpler signal model that does not include blocking of signals, such as the one in the ISO C standard, may not behave properly if invoked with some signals blocked. Therefore, it is best not to block or ignore signals across *exec*s without explicit reason to do so, and especially not to block signals across *exec*s of arbitrary (not closely co-operating) programs.

The *exec* functions always save the value of the effective user ID and effective group ID of the process at the completion of the *exec*, whether or not the set-user-ID or the set-group-ID bit of the process image file is set.

The statement about *argv*[ ] and *envp*[ ] being constants is included to make explicit to future writers of language bindings that these objects are completely constant. Due to a limitation of the ISO C standard, it is not possible to state that idea in standard C. Specifying two levels of *const–qualification* for the *argv*[ ] and *envp*[ ] parameters for the *exec* functions may seem to be the natural choice, given that these functions do not modify either the array of pointers or the characters to which the function points, but this would disallow existing correct code. Instead, only the array of pointers is noted as constant. The table of assignment compatibility for *dst*=*src*, derived from the ISO C standard summarizes the compatibility:

dst:	**char *[ ]**	**const char *[ ]**	**char *const[ ]**	**const char *const[ ]**
src:				
char *[ ]	VALID	—	VALID	—
const char *[ ]	—	VALID	—	VALID
char * const [ ]	—	—	VALID	—
const char *const[ ]	—	—	—	VALID

Since all existing code has a source type matching the first row, the column that gives the most valid combinations is the third column. The only other possibility is the fourth column, but using it would require a cast on the *argv* or *envp* arguments. It is unfortunate that the fourth column cannot be used, because the declaration a non-expert would naturally use would be that in the second row.

The ISO C standard and this volume of IEEE Std 1003.1-200x do not conflict on the use of *environ*, but some historical implementations of *environ* may cause a conflict. As long as *environ* is treated in the same way as an entry point (for example, *fork*( )), it conforms to both standards. A library can contain *fork*( ), but if there is a user-provided *fork*( ), that *fork*( ) is given precedence and no problem ensues. The situation is similar for *environ*: the definition in this volume of IEEE Std 1003.1-200x is to be used if there is no user-provided *environ* to take precedence. At least three implementations are known to exist that solve this problem.

[E2BIG]	The limit {ARG_MAX} applies not just to the size of the argument list, but to the sum of that and the size of the environment list.
[EFAULT]	Some historical systems return [EFAULT] rather than [ENOEXEC] when the new process image file is corrupted. They are non-conforming.
[EINVAL]	This error condition was added to IEEE Std 1003.1-200x to allow an implementation to detect executable files generated for different architectures, and indicate this situation to the application. Historical implementations of shells, *execvp*( ), and *execlp*( ) that encounter an [ENOEXEC] error will execute a shell on the assumption that the file is a shell script. This will not produce the desired effect when the file is a valid executable for a different

architecture. An implementation may now choose to avoid this problem by returning [EINVAL] when a valid executable for a different architecture is encountered. Some historical implementations return [EINVAL] to indicate that the *path* argument contains a character with the high order bit set. The standard developers chose to deviate from historical practice for the following reasons:

1. The new utilization of [EINVAL] will provide some measure of utility to the user community.
2. Historical use of [EINVAL] is not acceptable in an internationalized operating environment.

[ENAMETOOLONG]
Since the file pathname may be constructed by taking elements in the *PATH* variable and putting them together with the filename, the [ENAMETOOLONG] error condition could also be reached this way.

[ETXTBSY] System V returns this error when the executable file is currently open for writing by some process. This volume of IEEE Std 1003.1-200x neither requires nor prohibits this behavior.

Other systems (such as System V) may return [EINTR] from *exec*. This is not addressed by this volume of IEEE Std 1003.1-200x, but implementations may have a window between the call to *exec* and the time that a signal could cause one of the *exec* calls to return with [EINTR].

An explicit statement regarding the floating-point environment (as defined in the **<fenv.h>** header) was added to make it clear that the floating-point environment is set to its default when a call to one of the *exec* functions succeeds. The requirements for inheritance or setting to the default for other process and thread start-up functions is covered by more generic statements in their descriptions and can be summarized as follows:

posix_spawn( )	**Set to default.**
fork( )	Inherit.
pthread_create( )	Inherit.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, behavior is defined for when the process image file is not a valid executable.
- In this issue, _POSIX_SAVED_IDS is mandated, thus the effective user ID and effective group ID of the new process image shall be saved (as the saved set-user-ID and the saved set-group-ID) for use by the *setuid*( ) function.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [EINVAL] mandatory error condition is added.
- The [ELOOP] optional error condition is added.

The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for typed memory.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

IEEE PASC Interpretation 1003.1 #132 is applied.

The DESCRIPTION is updated to make it explicit that the floating-point environment in the new process image is set to the default.

NAME

exit, _Exit, _exit — terminate a process

SYNOPSIS

```
#include <stdlib.h>

void exit(int status);
void _Exit(int status);

#include <unistd.h>

void _exit(int status);
```

DESCRIPTION

The functionality described on this reference page for the *exit*( ) and *_Exit*( ) functions is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard are unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The value of *status* may be 0, EXIT_SUCCESS, EXIT_FAILURE, or any other value, though only the least significant 8 bits (that is, *status* & 0377) shall be available to a waiting parent process.

The *exit*( ) function shall first call all functions registered by *atexit*( ), in the reverse order of their registration, except that a function is called after any previously registered functions that had already been called at the time it was registered. Each function is called as many times as it was registered. If, during the call to any such function, a call to the *longjmp*( ) function is made that would terminate the call to the registered function, the behavior is undefined.

If a function registered by a call to *atexit*( ) fails to return, the remaining registered functions shall not be called and the rest of the *exit*( ) processing shall not be completed. If *exit*( ) is called more than once, the behavior is undefined.

The *exit*( ) function shall then flush all open streams with unwritten buffered data, close all open streams, and remove all files created by *tmpfile*( ). Finally, control shall be terminated with the consequences described below.

The *_Exit*( ) and *_exit*( ) functions shall be functionally equivalent.

The *_Exit*( ) and *_exit*( ) functions shall not call functions registered with *atexit*( ) nor any registered signal handlers. Whether open streams are flushed or closed, or temporary files are removed is implementation-defined. Finally, the calling process is terminated with the consequences described below.

These functions shall terminate the calling process with the following consequences:

Note: These consequences are all extensions to the ISO C standard and are not further CX shaded. However, XSI extensions are shaded.

- All of the file descriptors, directory streams, conversion descriptors, and message catalog descriptors open in the calling process shall be closed.
- If the parent process of the calling process is executing a *wait*( ) or *waitpid*( ), and has neither set its SA_NOCLDWAIT flag nor set SIGCHLD to SIG_IGN, it shall be notified of the calling process' termination and the low-order eight bits (that is, bits 0377) of *status* are made available to it. If the parent is not waiting, the child's status shall be made available to it when the parent subsequently executes *wait*( ) or *waitpid*( ).

  The semantics of the *waitid*( ) function shall be equivalent to *wait*( ).
- If the parent process of the calling process is not executing a *wait*( ) or *waitpid*( ), and has neither set its SA_NOCLDWAIT flag nor set SIGCHLD to SIG_IGN, the calling process shall be transformed into a *zombie process*. A *zombie process* is an inactive process and it shall be

deleted at some later time when its parent process executes *wait*( ) or *waitpid*( ).

XSI The semantics of the *waitid*( ) function shall be equivalent to *wait*( ).

- Termination of a process does not directly terminate its children. The sending of a SIGHUP signal as described below indirectly terminates children in some circumstances.
- Either:

  If the implementation supports the SIGCHLD signal, a SIGCHLD shall be sent to the parent process.

  Or:

  XSI If the parent process has set its SA_NOCLDWAIT flag, or set SIGCHLD to SIG_IGN, the status shall be discarded, and the lifetime of the calling process shall end immediately. If SA_NOCLDWAIT is set, it is implementation-defined whether a SIGCHLD signal is sent to the parent process.
- The parent process ID of all of the calling process' existing child processes and zombie processes shall be set to the process ID of an implementation-defined system process. That is, these processes shall be inherited by a special system process.
- XSI Each attached shared-memory segment is detached and the value of *shm_nattch* (see *shmget*( )) in the data structure associated with its shared memory ID shall be decremented by 1.
- XSI For each semaphore for which the calling process has set a *semadj* value (see *semop*( )), that value shall be added to the *semval* of the specified semaphore.
- If the process is a controlling process, the SIGHUP signal shall be sent to each process in the foreground process group of the controlling terminal belonging to the calling process.
- If the process is a controlling process, the controlling terminal associated with the session shall be disassociated from the session, allowing it to be acquired by a new controlling process.
- If the exit of the process causes a process group to become orphaned, and if any member of the newly-orphaned process group is stopped, then a SIGHUP signal followed by a SIGCONT signal shall be sent to each process in the newly-orphaned process group.
- SEM All open named semaphores in the calling process shall be closed as if by appropriate calls to *sem_close*( ).
- ML Any memory locks established by the process via calls to *mlockall*( ) or *mlock*( ) shall be removed. If locked pages in the address space of the calling process are also mapped into the address spaces of other processes and are locked by those processes, the locks established by the other processes shall be unaffected by the call by this process to *_Exit*( ) or *_exit*( ).
- MF|SHM Memory mappings created in the process shall be unmapped before the process is destroyed.
- TYM Any blocks of typed memory that were mapped in the calling process shall be unmapped, as if *munmap*( ) was implicitly called to unmap them.
- MSG All open message queue descriptors in the calling process shall be closed as if by appropriate calls to *mq_close*( ).
- AIO Any outstanding cancelable asynchronous I/O operations may be canceled. Those asynchronous I/O operations that are not canceled shall complete as if the *_Exit*( ) or *_exit*( ) operation had not yet occurred, but any associated signal notifications shall be suppressed.

The *_Exit*( ) or *_exit*( ) operation may block awaiting such I/O completion. Whether any I/O is canceled, and which I/O may be canceled upon *_Exit*( ) or *_exit*( ), is implementation-defined.

- Threads terminated by a call to *_Exit*( ) or *_exit*( ) shall not invoke their cancelation cleanup handlers or per-thread data destructors.
- TRC If the calling process is a trace controller process, any trace streams that were created by the calling process shall be shut down as described by the *posix_trace_shutdown*( ) function, and any process' mapping of trace event names to trace event type identifiers built for these trace streams may be deallocated.

RETURN VALUE

These functions do not return.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Normally applications should use *exit*( ) rather than *_Exit*( ) or *_exit*( ).

RATIONALE

Process Termination

Early proposals drew a distinction between normal and abnormal process termination. Abnormal termination was caused only by certain signals and resulted in implementation-defined ‘‘actions’’, as discussed below. Subsequent proposals distinguished three types of termination: *normal termination* (as in the current specification), *simple abnormal termination*, and *abnormal termination with actions*. Again the distinction between the two types of abnormal termination was that they were caused by different signals and that implementation-defined actions would result in the latter case. Given that these actions were completely implementation-defined, the early proposals were only saying when the actions could occur and how their occurrence could be detected, but not what they were. This was of little or no use to conforming applications, and thus the distinction is not made in this volume of IEEE Std 1003.1-200x.

The implementation-defined actions usually include, in most historical implementations, the creation of a file named **core** in the current working directory of the process. This file contains an image of the memory of the process, together with descriptive information about the process, perhaps sufficient to reconstruct the state of the process at the receipt of the signal.

There is a potential security problem in creating a **core** file if the process was set-user-ID and the current user is not the owner of the program, if the process was set-group-ID and none of the user's groups match the group of the program, or if the user does not have permission to write in the current directory. In this situation, an implementation either should not create a **core** file or should make it unreadable by the user.

Despite the silence of this volume of IEEE Std 1003.1-200x on this feature, applications are advised not to create files named **core** because of potential conflicts in many implementations. Some historical implementations use a different name than **core** for the file, such as by appending the process ID to the filename.

Terminating a Process

It is important that the consequences of process termination as described occur regardless of whether the process called *_exit*( ) (perhaps indirectly through *exit*( )) or instead was terminated due to a signal or for some other reason. Note that in the specific case of *exit*( ) this means that the *status* argument to *exit*( ) is treated in the same way as the *status* argument to *_exit*( ).

A language other than C may have other termination primitives than the C-language *exit*( ) function, and programs written in such a language should use its native termination primitives, but those should have as part of their function the behavior of *_exit*( ) as described. Implementations in languages other than C are outside the scope of the present version of this volume of IEEE Std 1003.1-200x, however.

As required by the ISO C standard, using **return** from *main*( ) has the same behavior (other than with respect to language scope issues) as calling *exit*( ) with the returned value. Reaching the end of the *main*( ) function has the same behavior as calling *exit*(0).

A value of zero (or EXIT_SUCCESS, which is required to be zero) for the argument *status* conventionally indicates successful termination. This corresponds to the specification for *exit*( ) in the ISO C standard. The convention is followed by utilities such as *make* and various shells, which interpret a zero status from a child process as success. For this reason, applications should not call *exit*(0) or *_exit*(0) when they terminate unsuccessfully; for example, in signal-catching functions.

Historically, the implementation-defined process that inherits children whose parents have terminated without waiting on them is called *init* and has a process ID of 1.

The sending of a SIGHUP to the foreground process group when a controlling process terminates corresponds to somewhat different historical implementations. In System V, the kernel sends a SIGHUP on termination of (essentially) a controlling process. In 4.2 BSD, the kernel does not send SIGHUP in a case like this, but the termination of a controlling process is usually noticed by a system daemon, which arranges to send a SIGHUP to the foreground process group with the *vhangup*( ) function. However, in 4.2 BSD, due to the behavior of the shells that support job control, the controlling process is usually a shell with no other processes in its process group. Thus, a change to make *_exit*( ) behave this way in such systems should not cause problems with existing applications.

The termination of a process may cause a process group to become orphaned in either of two ways. The connection of a process group to its parent(s) outside of the group depends on both the parents and their children. Thus, a process group may be orphaned by the termination of the last connecting parent process outside of the group or by the termination of the last direct descendant of the parent process(es). In either case, if the termination of a process causes a process group to become orphaned, processes within the group are disconnected from their job control shell, which no longer has any information on the existence of the process group. Stopped processes within the group would languish forever. In order to avoid this problem, newly orphaned process groups that contain stopped processes are sent a SIGHUP signal and a SIGCONT signal to indicate that they have been disconnected from their session. The SIGHUP signal causes the process group members to terminate unless they are catching or ignoring SIGHUP. Under most circumstances, all of the members of the process group are stopped if any of them are stopped.

The action of sending a SIGHUP and a SIGCONT signal to members of a newly orphaned process group is similar to the action of 4.2 BSD, which sends SIGHUP and SIGCONT to each stopped child of an exiting process. If such children exit in response to the SIGHUP, any additional descendants receive similar treatment at that time. In this volume of IEEE Std 1003.1-200x, the signals are sent to the entire process group at the same time. Also, in this volume of IEEE Std 1003.1-200x, but not in 4.2 BSD, stopped processes may be orphaned, but may be members of a process group that is not orphaned; therefore, the action taken at *_exit*( ) must consider processes other than child processes.

It is possible for a process group to be orphaned by a call to *setpgid*( ) or *setsid*( ), as well as by process termination. This volume of IEEE Std 1003.1-200x does not require sending SIGHUP and SIGCONT in those cases, because, unlike process termination, those cases are not caused accidentally by applications that are unaware of job control. An implementation can choose to send SIGHUP and SIGCONT in those cases as an extension; such an extension must be documented as required in **<signal.h>**.

The ISO / IEC 9899: 1999 standard adds the *_Exit*( ) function that results in immediate program termination without triggering signals or *atexit*( )-registered functions. In IEEE Std 1003.1-200x, this is equivalent to the *_exit*( ) function.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Interactions with the SA_NOCLDWAIT flag and SIGCHLD signal are further clarified.

The values of *status* from *exit*( ) are better described.

Issue 6

Extensions beyond the ISO C standard are now marked.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for typed memory.

The following changes are made for alignment with the ISO / IEC 9899: 1999 standard:

- The *_Exit*( ) function is included.
- The DESCRIPTION is updated.

The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

References to the *wait3*( ) function are removed.

NAME

exp, expf, expl — exponential function

SYNOPSIS

```
#include <math.h>

double exp(double x);
float expf(float x);
long double expl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the base-*e* exponential of *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the exponential value of *x*.

If the correct value would cause overflow, a range error shall occur and *exp*( ), *expf*( ), and *expl*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

If the correct value would cause underflow, and is not representable, a range error may occur, MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, 1 shall be returned.

If *x* is –Inf, +0 shall be returned.

If *x* is +Inf, *x* shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions shall fail if:

Range Error The result overflows.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

Range Error The result underflows.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

Note that for IEEE Std 754-1985 **double**, $709.8 < x$ implies *exp*(x) has overflowed. The value $x < -708.4$ implies *exp*(x) has underflowed.

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

feclearexcept( ), *fetestexcept*( ), *isnan*( ), *log*( ), the Base Definitions volume of IEEE Std 1003.1-200x, Section 4.18, Treatment of Error Conditions for Mathematical Functions, **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *expf*( ) and *expl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

exp2, exp2f, exp2l — exponential base 2 functions

SYNOPSIS

```
#include <math.h>

double exp2(double x);
float exp2f(float x);
long double exp2l(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the base-2 exponential of *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return 2^x.

If the correct value would cause overflow, a range error shall occur and *exp2*( ), *exp2f*( ), and *exp2l*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

If the correct value would cause underflow, and is not representable, a range error may occur, MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, 1 shall be returned.

If *x* is –Inf, +0 shall be returned.

If *x* is +Inf, *x* shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions shall fail if:

Range Error	The result overflows. If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

Range Error	The result underflows. If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

For IEEE Std 754-1985 **double**, 1024 <= *x* implies *exp2*(*x*) has overflowed. The value *x* < −1022 implies *exp*(*x*) has underflowed.

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

NAME

expm1, expm1f, expm1l — compute exponential functions

SYNOPSIS

```
#include <math.h>

double expm1(double x);
float expm1f(float x);
long double expm1l(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute $e^{x}-1.0$.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions return $e^{x}-1.0$.

If the correct value would cause overflow, a range error shall occur and *expm1*( ), *expm1f*( ), and *expm1l*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, ±0 shall be returned.

If *x* is –Inf, –1 shall be returned.

If *x* is +Inf, *x* shall be returned.

If *x* is subnormal, a range error may occur and *x* should be returned.

ERRORS

These functions shall fail if:

Range Error	The result overflows. If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

MX Range Error	The value of *x* is subnormal. If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

The value of *expm1*(x) may be more accurate than *exp*(x)–1.0 for small values of x.

The *expm1*( ) and *log1p*( ) functions are useful for financial calculations of $((1+x)^n-1)/x$, namely:

```
expm1(n * log1p(x))/x
```

when x is very small (for example, when calculating small daily interest rates). These functions also simplify writing accurate inverse hyperbolic functions.

For IEEE Std 754-1985 **double**, $709.8 < x$ implies *expm1*(x) has overflowed.

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 6

The *expm1f*( ) and *expm1l*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The *expm1*( ) function is no longer marked as an extension. |

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard. |

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

fabs, fabsf, fabsl — absolute value function

SYNOPSIS

```
#include <math.h>

double fabs(double x);
float fabsf(float x);
long double fabsl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the absolute value of their argument *x*, |*x*|.

RETURN VALUE

Upon successful completion, these functions shall return the absolute value of *x*.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, +0 shall be returned.

If *x* is ±Inf, +Inf shall be returned.

ERRORS

No errors are defined.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *fabsf*( ) and *fabsl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

fattach — attach a STREAMS-based file descriptor to a file in the file system name space (**STREAMS**)

SYNOPSIS

XSR

```
#include <stropts.h>

int fattach(int fildes, const char *path);
```

DESCRIPTION

The *fattach*( ) function shall attach a STREAMS-based file descriptor to a file, effectively associating a pathname with *fildes*. The application shall ensure that the *fildes* argument is a valid open file descriptor associated with a STREAMS file. The *path* argument points to a pathname of an existing file. The application shall have the appropriate privileges, or is the owner of the file named by *path* and has write permission. A successful call to *fattach*( ) shall cause all pathnames that name the file named by *path* to name the STREAMS file associated with *fildes*, until the STREAMS file is detached from the file. A STREAMS file can be attached to more than one file and can have several pathnames associated with it.

The attributes of the named STREAMS file shall be initialized as follows: the permissions, user ID, group ID, and times are set to those of the file named by *path*, the number of links is set to 1, and the size and device identifier are set to those of the STREAMS file associated with *fildes*. If any attributes of the named STREAMS file are subsequently changed (for example, by *chmod*( )), neither the attributes of the underlying file nor the attributes of the STREAMS file to which *fildes* refers shall be affected.

File descriptors referring to the underlying file, opened prior to an *fattach*( ) call, shall continue to refer to the underlying file.

RETURN VALUE

Upon successful completion, *fattach*( ) shall return 0. Otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *fattach*( ) function shall fail if:

[EACCES]	Search permission is denied for a component of the path prefix, or the process is the owner of *path* but does not have write permissions on the file named by *path*.
[EBADF]	The *fildes* argument is not a valid open file descriptor.
[EBUSY]	The file named by *path* is currently a mount point or has a STREAMS file attached to it.
[ELOOP]	A loop exists in symbolic links encountered during resolution of the *path* argument.
[ENAMETOOLONG]	The size of *path* exceeds {PATH_MAX} or a component of *path* is longer than {NAME_MAX}.
[ENOENT]	A component of *path* does not name an existing file or *path* is an empty string.
[ENOTDIR]	A component of the path prefix is not a directory.
[EPERM]	The effective user ID of the process is not the owner of the file named by *path* and the process does not have appropriate privilege.

The *fattach*( ) function may fail if:

[EINVAL] The *fildes* argument does not refer to a STREAMS file.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG] Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}. |

[EXDEV] A link to a file on another file system was attempted.

EXAMPLES

Attaching a File Descriptor to a File

In the following example, *fd* refers to an open STREAMS file. The call to *fattach*( ) associates this STREAM with the file **/tmp/named-STREAM**, such that any future calls to open **/tmp/named-STREAM**, prior to breaking the attachment via a call to *fdetach*( ), will instead create a new file handle referring to the STREAMS file associated with *fd*.

```
#include <stropts.h>
...
    int fd;
    char *filename = "/tmp/named-STREAM";
    int ret;

    ret = fattach(fd, filename);
```

APPLICATION USAGE

The *fattach*( ) function behaves similarly to the traditional *mount*( ) function in the way a file is temporarily replaced by the root directory of the mounted file system. In the case of *fattach*( ), the replaced file need not be a directory and the replacing file is a STREAMS file.

RATIONALE

The file attributes of a file which has been the subject of an *fattach*( ) call are specifically set because of an artefact of the original implementation. The internal mechanism was the same as for the *mount*( ) function. Since *mount*( ) is typically only applied to directories, the effects when applied to a regular file are a little surprising, especially as regards the link count which rigidly remains one, even if there were several links originally and despite the fact that all original links refer to the STREAM as long as the *fattach*( ) remains in effect. |

FUTURE DIRECTIONS

None.

SEE ALSO

fdetach( ), *isastream*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stropts.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The [EXDEV] error is added to the list of optional errors in the ERRORS section.

Issue 6

This function is marked as part of the XSI STREAMS Option Group.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

NAME

fchdir — change working directory

SYNOPSIS

XSI

```
#include <unistd.h>

int fchdir(int fildes);
```

DESCRIPTION

The *fchdir*( ) function shall be equivalent to *chdir*( ) except that the directory that is to be the new current working directory is specified by the file descriptor *fildes*.

A conforming application can obtain a file descriptor for a file of type directory using *open*( ), provided that the file status flags and access modes do not contain O_WRONLY or O_RDWR.

RETURN VALUE

Upon successful completion, *fchdir*( ) shall return 0. Otherwise, it shall return −1 and set *errno* to indicate the error. On failure the current working directory shall remain unchanged.

ERRORS

The *fchdir*( ) function shall fail if:

[EACCES]	Search permission is denied for the directory referenced by *fildes*.
[EBADF]	The *fildes* argument is not an open file descriptor.
[ENOTDIR]	The open file descriptor *fildes* does not refer to a directory.

The *fchdir*( ) may fail if:

[EINTR]	A signal was caught during the execution of *fchdir*( ).
[EIO]	An I/O error occurred while reading from or writing to the file system.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

NAME

fchmod — change mode of a file

SYNOPSIS

```
#include <sys/stat.h>

int fchmod(int fildes, mode_t mode);
```

DESCRIPTION

The *fchmod*( ) function shall be equivalent to *chmod*( ) except that the file whose permissions are changed is specified by the file descriptor *fildes*.

SHM If *fildes* references a shared memory object, the *fchmod*( ) function need only affect the S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits.

TYM If *fildes* references a typed memory object, the behavior of *fchmod*( ) is unspecified.

If *fildes* refers to a socket, the behavior of *fchmod*( ) is unspecified.

XSR If *fildes* refers to a STREAM (which is *fattach*( )-ed into the file system name space) the call returns successfully, doing nothing.

RETURN VALUE

Upon successful completion, *fchmod*( ) shall return 0. Otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *fchmod*( ) function shall fail if:

[EBADF]	The *fildes* argument is not an open file descriptor.
[EPERM]	The effective user ID does not match the owner of the file and the process does not have appropriate privilege.
[EROFS]	The file referred to by *fildes* resides on a read-only file system.

The *fchmod*( ) function may fail if:

XSI	[EINTR]	The *fchmod*( ) function was interrupted by a signal.
XSI	[EINVAL]	The value of the *mode* argument is invalid.
	[EINVAL]	The *fildes* argument refers to a pipe and the implementation disallows execution of *fchmod*( ) on a pipe.

EXAMPLES

Changing the Current Permissions for a File

The following example shows how to change the permissions for a file named **/home/cnd/mod1** so that the owner and group have read/write/execute permissions, but the world only has read/write permissions.

```
#include <sys/stat.h>
#include <fcntl.h>

mode_t mode;
int    fildes;
...
fildes = open("/home/cnd/mod1", O_RDWR);
fchmod(fildes, S_IRWXU | S_IRWXG | S_IROTH | S_IWOTH);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

chmod( ), *chown*( ), *creat*( ), *fcntl*( ), *fstatvfs*( ), *mknod*( ), *open*( ), *read*( ), *stat*( ), *write*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/stat.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE and aligned with *fchmod*( ) in the POSIX Realtime Extension. Specifically, the second paragraph of the DESCRIPTION is added and a second instance of [EINVAL] is defined in the list of optional errors.

Issue 6

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by stating that *fchmod*( ) behavior is unspecified for typed memory objects.

NAME

fchown — change owner and group of a file

SYNOPSIS

```
#include <unistd.h>

int fchown(int fildes, uid_t owner, gid_t group);
```

DESCRIPTION

The *fchown*( ) function shall be equivalent to *chown*( ) except that the file whose owner and group are changed is specified by the file descriptor *fildes*.

RETURN VALUE

Upon successful completion, *fchown*( ) shall return 0. Otherwise, it shall return −1 and set *errno* to indicate the error.

ERRORS

The *fchown*( ) function shall fail if:

[EBADF]	The *fildes* argument is not an open file descriptor.
[EPERM]	The effective user ID does not match the owner of the file or the process does not have appropriate privilege and _POSIX_CHOWN_RESTRICTED indicates that such privilege is required.
[EROFS]	The file referred to by *fildes* resides on a read-only file system.

The *fchown*( ) function may fail if:

[EINVAL]	The owner or group ID is not a value supported by the implementation. The *fildes* argument refers to a pipe or socket or an *fattach*( )-ed STREAM and the implementation disallows execution of *fchown*( ) on a pipe. (XSR)
[EIO]	A physical I/O error has occurred.
[EINTR]	The *fchown*( ) function was interrupted by a signal which was caught.

EXAMPLES

Changing the Current Owner of a File

The following example shows how to change the owner of a file named **/home/cnd/mod1** to ‘‘jones’’ and the group to ‘‘cnd’’.

The numeric value for the user ID is obtained by extracting the user ID from the user database entry associated with ‘‘jones’’. Similarly, the numeric value for the group ID is obtained by extracting the group ID from the group database entry associated with ‘‘cnd’’. This example assumes the calling program has appropriate privileges.

```
#include <sys/types.h>
#include <unistd.h>
#include <fcntl.h>
#include <pwd.h>
#include <grp.h>

struct passwd *pwd;
struct group  *grp;
int            fildes;
...
fildes = open("/home/cnd/mod1", O_RDWR);
pwd = getpwnam("jones");
```

```
    grp = getgrnam("cnd");
    fchown(fildes, pwd->pw_uid, grp->gr_gid);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

chown( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<unistd.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that a call to *fchown*( ) may not be allowed on a pipe.

The *fchown*( ) function is now defined as mandatory.

NAME

fclose — close a stream

SYNOPSIS

```
#include <stdio.h>

int fclose(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fclose*( ) function shall cause the stream pointed to by *stream* to be flushed and the associated file to be closed. Any unwritten buffered data for the stream shall be written to the file; any unread buffered data shall be discarded. Whether or not the call succeeds, the stream shall be disassociated from the file and any buffer set by the *setbuf*( ) or *setvbuf*( ) function shall be disassociated from the stream. If the associated buffer was automatically allocated, it shall be deallocated.

CX The *fclose*( ) function shall mark for update the *st_ctime* and *st_mtime* fields of the underlying file, if the stream was writable, and if buffered data remains that has not yet been written to the file. The *fclose*( ) function shall perform the equivalent of a *close*( ) on the file descriptor that is associated with the stream pointed to by *stream*.

After the call to *fclose*( ), any use of *stream* results in undefined behavior.

RETURN VALUE

CX Upon successful completion, *fclose*( ) shall return 0; otherwise, it shall return EOF and set *errno* to indicate the error.

ERRORS

The *fclose*( ) function shall fail if:

CX	[EAGAIN]	The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the process would be delayed in the write operation.
CX	[EBADF]	The file descriptor underlying stream is not valid.
CX	[EFBIG]	An attempt was made to write a file that exceeds the maximum file size.
XSI	[EFBIG]	An attempt was made to write a file that exceeds the process' file size limit.
CX	[EFBIG]	The file is a regular file and an attempt was made to write at or beyond the offset maximum associated with the corresponding stream.
CX	[EINTR]	The *fclose*( ) function was interrupted by a signal.
CX	[EIO]	The process is a member of a background process group attempting to write to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.
CX	[ENOSPC]	There was no free space remaining on the device containing the file.
CX	[EPIPE]	An attempt is made to write to a pipe or FIFO that is not open for reading by any process. A SIGPIPE signal shall also be sent to the thread.

The *fclose*( ) function may fail if:

CX	[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

close( ), *fopen*( ), *getrlimit*( ), *ulimit*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EFBIG] error is added as part of the large file support extensions.
- The [ENXIO] optional error condition is added.

The DESCRIPTION is updated to note that the stream and any buffer are disassociated whether or not the call succeeds. This is for alignment with the ISO / IEC 9899: 1999 standard.

NAME

fcntl — file control

SYNOPSIS

OH
```
#include <unistd.h>
#include <fcntl.h>

int fcntl(int fildes, int cmd, ...);
```

DESCRIPTION

The *fcntl*( ) function shall perform the operations described below on open files. The *fildes* argument is a file descriptor.

The available values for *cmd* are defined in **<fcntl.h>** and are as follows:

F_DUPFD	Return a new file descriptor which shall be the lowest numbered available (that is, not already open) file descriptor greater than or equal to the third argument, *arg*, taken as an integer of type **int**. The new file descriptor shall refer to the same open file description as the original file descriptor, and shall share any locks. The FD_CLOEXEC flag associated with the new file descriptor shall be cleared to keep the file open across calls to one of the *exec* functions.
F_GETFD	Get the file descriptor flags defined in **<fcntl.h>** that are associated with the file descriptor *fildes*. File descriptor flags are associated with a single file descriptor and do not affect other file descriptors that refer to the same file.
F_SETFD	Set the file descriptor flags defined in **<fcntl.h>**, that are associated with *fildes*, to the third argument, *arg*, taken as type **int**. If the FD_CLOEXEC flag in the third argument is 0, the file shall remain open across the *exec* functions; otherwise, the file shall be closed upon successful execution of one of the *exec* functions.
F_GETFL	Get the file status flags and file access modes, defined in **<fcntl.h>**, for the file description associated with *fildes*. The file access modes can be extracted from the return value using the mask O_ACCMODE, which is defined in **<fcntl.h>**. File status flags and file access modes are associated with the file description and do not affect other file descriptors that refer to the same file with different open file descriptions.
F_SETFL	Set the file status flags, defined in **<fcntl.h>**, for the file description associated with *fildes* from the corresponding bits in the third argument, *arg*, taken as type **int**. Bits corresponding to the file access mode and the file creation flags, as defined in **<fcntl.h>**, that are set in *arg* shall be ignored. If any bits in *arg* other than those mentioned here are changed by the application, the result is unspecified.
F_GETOWN	If *fildes* refers to a socket, get the process or process group ID specified to receive SIGURG signals when out-of-band data is available. Positive values indicate a process ID; negative values, other than −1, indicate a process group ID. If *fildes* does not refer to a socket, the results are unspecified.
F_SETOWN	If *fildes* refers to a socket, set the process or process group ID specified to receive SIGURG signals when out-of-band data is available, using the value of the third argument, *arg*, taken as type **int**. Positive values indicate a process ID; negative values, other than −1, indicate a process group ID. If *fildes* does not refer to a socket, the results are unspecified.

The following values for *cmd* are available for advisory record locking. Record locking shall be supported for regular files, and may be supported for other files.

F_GETLK	Get the first lock which blocks the lock description pointed to by the third argument, *arg*, taken as a pointer to type **struct flock**, defined in **<fcntl.h>**. The information retrieved shall overwrite the information passed to *fcntl*( ) in the structure **flock**. If no lock is found that would prevent this lock from being created, then the structure shall be left unchanged except for the lock type which shall be set to F_UNLCK.
F_SETLK	Set or clear a file segment lock according to the lock description pointed to by the third argument, *arg*, taken as a pointer to type **struct flock**, defined in **<fcntl.h>**. F_SETLK can establish shared (or read) locks (F_RDLCK) or exclusive (or write) locks (F_WRLCK), as well as to remove either type of lock (F_UNLCK). F_RDLCK, F_WRLCK, and F_UNLCK are defined in **<fcntl.h>**. If a shared or exclusive lock cannot be set, *fcntl*( ) shall return immediately with a return value of –1.
F_SETLKW	This command shall be equivalent to F_SETLK except that if a shared or exclusive lock is blocked by other locks, the thread shall wait until the request can be satisfied. If a signal that is to be caught is received while *fcntl*( ) is waiting for a region, *fcntl*( ) shall be interrupted. Upon return from the signal handler, *fcntl*( ) shall return –1 with *errno* set to [EINTR], and the lock operation shall not be done.

Additional implementation-defined values for *cmd* may be defined in **<fcntl.h>**. Their names shall start with F_.

When a shared lock is set on a segment of a file, other processes shall be able to set shared locks on that segment or a portion of it. A shared lock prevents any other process from setting an exclusive lock on any portion of the protected area. A request for a shared lock shall fail if the file descriptor was not opened with read access.

An exclusive lock shall prevent any other process from setting a shared lock or an exclusive lock on any portion of the protected area. A request for an exclusive lock shall fail if the file descriptor was not opened with write access.

The structure **flock** describes the type (*l_type*), starting offset (*l_whence*), relative offset (*l_start*), size (*l_len*), and process ID (*l_pid*) of the segment of the file to be affected.

The value of *l_whence* is SEEK_SET, SEEK_CUR, or SEEK_END, to indicate that the relative offset *l_start* bytes shall be measured from the start of the file, current position, or end of the file, respectively. The value of *l_len* is the number of consecutive bytes to be locked. The value of *l_len* may be negative (where the definition of **off_t** permits negative values of *l_len*). The *l_pid* field is only used with F_GETLK to return the process ID of the process holding a blocking lock. After a successful F_GETLK request, when a blocking lock is found, the values returned in the **flock** structure shall be as follows:

l_type	Type of blocking lock found.
l_whence	SEEK_SET.
l_start	Start of the blocking lock.
l_len	Length of the blocking lock.
l_pid	Process ID of the process that holds the blocking lock.

If the command is F_SETLKW and the process must wait for another process to release a lock, then the range of bytes to be locked shall be determined before the *fcntl*( ) function blocks. If the file size or file descriptor seek offset change while *fcntl*( ) is blocked, this shall not affect the range of bytes locked.

If *l_len* is positive, the area affected shall start at *l_start* and end at $l\_start+l\_len-1$. If *l_len* is negative, the area affected shall start at $l\_start+l\_len$ and end at $l\_start-1$. Locks may start and extend beyond the current end of a file, but shall not extend before the beginning of the file. A lock shall be set to extend to the largest possible value of the file offset for that file by setting *l_len* to 0. If such a lock also has *l_start* set to 0 and *l_whence* is set to SEEK_SET, the whole file shall be locked.

There shall be at most one type of lock set for each byte in the file. Before a successful return from an F_SETLK or an F_SETLKW request when the calling process has previously existing locks on bytes in the region specified by the request, the previous lock type for each byte in the specified region shall be replaced by the new lock type. As specified above under the descriptions of shared locks and exclusive locks, an F_SETLK or an F_SETLKW request (respectively) shall fail or block when another process has existing locks on bytes in the specified region and the type of any of those locks conflicts with the type specified in the request.

All locks associated with a file for a given process shall be removed when a file descriptor for that file is closed by that process or the process holding that file descriptor terminates. Locks are not inherited by a child process.

A potential for deadlock occurs if a process controlling a locked region is put to sleep by attempting to lock another process' locked region. If the system detects that sleeping until a locked region is unlocked would cause a deadlock, *fcntl*( ) shall fail with an [EDEADLK] error.

An unlock (F_UNLCK) request in which *l_len* is non-zero and the offset of the last byte of the requested segment is the maximum value for an object of type **off_t**, when the process has an existing lock in which *l_len* is 0 and which includes the last byte of the requested segment, shall be treated as a request to unlock from the start of the requested segment with an *l_len* equal to 0. Otherwise, an unlock (F_UNLCK) request shall attempt to unlock only the requested segment.

SHM When the file descriptor *fildes* refers to a shared memory object, the behavior of *fcntl*( ) shall be the same as for a regular file except the effect of the following values for the argument *cmd* shall be unspecified: F_SETFL, F_GETLK, F_SETLK, and F_SETLKW.

TYM If *fildes* refers to a typed memory object, the result of the *fcntl*( ) function is unspecified.

RETURN VALUE

Upon successful completion, the value returned shall depend on *cmd* as follows:

F_DUPFD	A new file descriptor.
F_GETFD	Value of flags defined in **<fcntl.h>**. The return value shall not be negative.
F_SETFD	Value other than −1.
F_GETFL	Value of file status flags and access modes. The return value is not negative.
F_SETFL	Value other than −1.
F_GETLK	Value other than −1.
F_SETLK	Value other than −1.
F_SETLKW	Value other than −1.
F_GETOWN	Value of the socket owner process or process group; this will not be −1.

F_SETOWN	Value other than –1.

Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *fcntl*( ) function shall fail if:

[EACCES] or [EAGAIN]
The *cmd* argument is F_SETLK; the type of lock (*l_type*) is a shared (F_RDLCK) or exclusive (F_WRLCK) lock and the segment of a file to be locked is already exclusive-locked by another process, or the type is an exclusive lock and some portion of the segment of a file to be locked is already shared-locked or exclusive-locked by another process.

[EBADF]	The *fildes* argument is not a valid open file descriptor, or the argument *cmd* is F_SETLK or F_SETLKW, the type of lock, *l_type*, is a shared lock (F_RDLCK), and *fildes* is not a valid file descriptor open for reading, or the type of lock *l_type*, is an exclusive lock (F_WRLCK), and *fildes* is not a valid file descriptor open for writing.
[EINTR]	The *cmd* argument is F_SETLKW and the function was interrupted by a signal.
[EINVAL]	The *cmd* argument is invalid, or the *cmd* argument is F_DUPFD and *arg* is negative or greater than or equal to {OPEN_MAX}, or the *cmd* argument is F_GETLK, F_SETLK, or F_SETLKW and the data pointed to by *arg* is not valid, or *fildes* refers to a file that does not support locking.
[EMFILE]	The argument *cmd* is F_DUPFD and {OPEN_MAX} file descriptors are currently open in the calling process, or no file descriptors greater than or equal to *arg* are available.
[ENOLCK]	The argument *cmd* is F_SETLK or F_SETLKW and satisfying the lock or unlock request would result in the number of locked regions in the system exceeding a system-imposed limit.
[EOVERFLOW]	One of the values to be returned cannot be represented correctly.
[EOVERFLOW]	The *cmd* argument is F_GETLK, F_SETLK, or F_SETLKW and the smallest or, if *l_len* is non-zero, the largest offset of any byte in the requested segment cannot be represented correctly in an object of type **off_t**.

The *fcntl*( ) function may fail if:

[EDEADLK]	The *cmd* argument is F_SETLKW, the lock is blocked by some lock from another process and putting the calling process to sleep, waiting for that lock to become free would cause a deadlock.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The ellipsis in the SYNOPSIS is the syntax specified by the ISO C standard for a variable number of arguments. It is used because System V uses pointers for the implementation of file locking functions.

The *arg* values to F_GETFD, F_SETFD, F_GETFL, and F_SETFL all represent flag values to allow for future growth. Applications using these functions should do a read-modify-write operation on them, rather than assuming that only the values defined by this volume of IEEE Std 1003.1-200x are valid. It is a common error to forget this, particularly in the case of F_SETFD.

This volume of IEEE Std 1003.1-200x permits concurrent read and write access to file data using the *fcntl*( ) function; this is a change from the 1984 /usr/group standard and early proposals. Without concurrency controls, this feature may not be fully utilized without occasional loss of data.

Data losses occur in several ways. One case occurs when several processes try to update the same record, without sequencing controls; several updates may occur in parallel and the last writer ‘‘wins’’. Another case is a bit-tree or other internal list-based database that is undergoing reorganization. Without exclusive use to the tree segment by the updating process, other reading processes chance getting lost in the database when the index blocks are split, condensed, inserted, or deleted. While *fcntl*( ) is useful for many applications, it is not intended to be overly general and does not handle the bit-tree example well.

This facility is only required for regular files because it is not appropriate for many devices such as terminals and network connections.

Since *fcntl*( ) works with ‘‘any file descriptor associated with that file, however it is obtained’’, the file descriptor may have been inherited through a *fork*( ) or *exec* operation and thus may affect a file that another process also has open.

The use of the open file description to identify what to lock requires extra calls and presents problems if several processes are sharing an open file description, but there are too many implementations of the existing mechanism for this volume of IEEE Std 1003.1-200x to use different specifications.

Another consequence of this model is that closing any file descriptor for a given file (whether or not it is the same open file description that created the lock) causes the locks on that file to be relinquished for that process. Equivalently, any close for any file/process pair relinquishes the locks owned on that file for that process. But note that while an open file description may be shared through *fork*( ), locks are not inherited through *fork*( ). Yet locks may be inherited through one of the *exec* functions.

The identification of a machine in a network environment is outside of the scope of this volume of IEEE Std 1003.1-200x. Thus, an *l_sysid* member, such as found in System V, is not included in the locking structure.

Changing of lock types can result in a previously locked region being split into smaller regions.

Mandatory locking was a major feature of the 1984 /usr/group standard.

For advisory file record locking to be effective, all processes that have access to a file must cooperate and use the advisory mechanism before doing I/O on the file. Enforcement-mode record locking is important when it cannot be assumed that all processes are cooperating. For example, if one user uses an editor to update a file at the same time that a second user executes another process that updates the same file and if only one of the two processes is using advisory locking, the processes are not cooperating. Enforcement-mode record locking would protect against accidental collisions.

Secondly, advisory record locking requires a process using locking to bracket each I/O operation with lock (or test) and unlock operations. With enforcement-mode file and record locking, a process can lock the file once and unlock when all I/O operations have been completed. Enforcement-mode record locking provides a base that can be enhanced; for example, with sharable locks. That is, the mechanism could be enhanced to allow a process to lock a file so other processes could read it, but none of them could write it.

Mandatory locks were omitted for several reasons:

1. Mandatory lock setting was done by multiplexing the set-group-ID bit in most implementations; this was confusing, at best.
2. The relationship to file truncation as supported in 4.2 BSD was not well specified.
3. Any publicly readable file could be locked by anyone. Many historical implementations keep the password database in a publicly readable file. A malicious user could thus prohibit logins. Another possibility would be to hold open a long-distance telephone line.
4. Some demand-paged historical implementations offer memory mapped files, and enforcement cannot be done on that type of file.

Since sleeping on a region is interrupted with any signal, *alarm*( ) may be used to provide a timeout facility in applications requiring it. This is useful in deadlock detection. Since implementation of full deadlock detection is not always feasible, the [EDEADLK] error was made optional.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the DESCRIPTION, sentences describing behavior when *l_len* is negative are now mandated, and the description of unlock (F_UNLOCK) when *l_len* is non-negative is mandated.
- In the ERRORS section, the [EINVAL] error condition has the case mandated when the *cmd* is invalid, and two [EOVERFLOW] error conditions are added.

The F_GETOWN and F_SETOWN values are added for sockets.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that the extent of the bytes locked is determined prior to the blocking action.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *fcntl*( ) results are unspecified for typed memory objects.

The DESCRIPTION is updated to avoid use of the term ''must'' for application requirements.

NAME

fcvt — convert a floating-point number to a string (**LEGACY**)

SYNOPSIS

XSI

```
#include <stdlib.h>

char *fcvt(double value, int ndigit, int *restrict decpt,
    int *restrict sign);
```

DESCRIPTION

Refer to *ecvt*( ).

NAME

fdatasync — synchronize the data of a file (**REALTIME**)

SYNOPSIS

SIO

```
#include <unistd.h>

int fdatasync(int fildes);
```

DESCRIPTION

The *fdatasync*( ) function shall force all currently queued I/O operations associated with the file indicated by file descriptor *fildes* to the synchronized I/O completion state.

The functionality shall be equivalent to *fsync*( ) with the symbol _POSIX_SYNCHRONIZED_IO defined, with the exception that all I/O operations shall be completed as defined for synchronized I/O data integrity completion. |

RETURN VALUE

If successful, the *fdatasync*( ) function shall return the value 0; otherwise, the function shall return the value −1 and set *errno* to indicate the error. If the *fdatasync*( ) function fails, outstanding I/O operations are not guaranteed to have been completed.

ERRORS

The *fdatasync*( ) function shall fail if:

[EBADF]	The *fildes* argument is not a valid file descriptor open for writing.
[EINVAL]	This implementation does not support synchronized I/O for this file.

In the event that any of the queued I/O operations fail, *fdatasync*( ) shall return the error conditions defined for *read*( ) and *write*( ).

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

aio_fsync( ), *fcntl*( ), *fsync*( ), *open*( ), *read*( ), *write*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<unistd.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Synchronized Input and Output option.

The *fdatasync*( ) function is marked as part of the Synchronized Input and Output option.

NAME

fdetach — detach a name from a STREAMS-based file descriptor (**STREAMS**)

SYNOPSIS

XSR

```
#include <stropts.h>

int fdetach(const char *path);
```

DESCRIPTION

The *fdetach*( ) function shall detach a STREAMS-based file from the file to which it was attached by a previous call to *fattach*( ). The *path* argument points to the pathname of the attached STREAMS file. The process shall have appropriate privileges or be the owner of the file. A successful call to *fdetach*( ) shall cause all pathnames that named the attached STREAMS file to again name the file to which the STREAMS file was attached. All subsequent operations on *path* shall operate on the underlying file and not on the STREAMS file.

All open file descriptions established while the STREAMS file was attached to the file referenced by *path* shall still refer to the STREAMS file after the *fdetach*( ) has taken effect.

If there are no open file descriptors or other references to the STREAMS file, then a successful call to *fdetach*( ) shall have be equivalent to performing the last *close*( ) on the attached file.

RETURN VALUE

Upon successful completion, *fdetach*( ) shall return 0; otherwise, it shall return −1 and set *errno* to indicate the error.

ERRORS

The *fdetach*( ) function shall fail if:

[EACCES]	Search permission is denied on a component of the path prefix.
[EINVAL]	The *path* argument names a file that is not currently attached.
[ELOOP]	A loop exists in symbolic links encountered during resolution of the *path* argument.
[ENAMETOOLONG]	The size of a pathname exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
[ENOENT]	A component of *path* does not name an existing file or *path* is an empty string.
[ENOTDIR]	A component of the path prefix is not a directory.
[EPERM]	The effective user ID is not the owner of *path* and the process does not have appropriate privileges.

The *fdetach*( ) function may fail if:

[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.
[ENAMETOOLONG]	Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.

EXAMPLES

Detaching a File

The following example detaches the STREAMS-based file **/tmp/named-STREAM** from the file to which it was attached by a previous, successful call to *fattach*( ). Subsequent calls to open this file refer to the underlying file, not to the STREAMS file.

```
#include <stropts.h>
...
    char *filename = "/tmp/named-STREAM";
    int ret;

    ret = fdetach(filename);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

NAME

fdim, fdimf, fdiml — compute positive difference between two floating-point numbers

SYNOPSIS

```
#include <math.h>

double fdim(double x, double y);
float fdimf(float x, float y);
long double fdiml(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall determine the positive difference between their arguments. If *x* is greater than *y*, $x-y$ is returned. If *x* is less than or equal to *y*, +0 is returned.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the positive difference value.

If $x-y$ is positive and overflows, a range error shall occur and *fdim*( ), *fdimf*( ), and *fdiml*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

XSI If $x-y$ is positive and underflows, a range error may occur, and either $(x-y)$ (if representable), or 0.0 (if supported), or an implementation-defined value shall be returned.

MX If *x* or *y* is NaN, a NaN shall be returned.

ERRORS

The *fdim*( ) function shall fail if:

Range Error The result overflows.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

The *fdim*( ) function may fail if:

Range Error The result underflows.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On implementations supporting IEEE Std 754-1985, $x-y$ cannot underflow, and hence the 0.0 return value is shaded as an extension for implementations supporting the XSI extension rather than an MX extension.

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

NAME

fdopen — associate a stream with a file descriptor

SYNOPSIS

CX

```
#include <stdio.h>

FILE *fdopen(int fildes, const char *mode);
```

DESCRIPTION

The *fdopen*( ) function shall associate a stream with a file descriptor.

The *mode* argument is a character string having one of the following values:

r or *rb*	Open a file for reading.
w or *wb*	Open a file for writing.
a or *ab*	Open a file for writing at end of file.
r+ or *rb*+ or *r*+*b*	Open a file for update (reading and writing).
w+ or *wb*+ or *w*+*b*	Open a file for update (reading and writing).
a+ or *ab*+ or *a*+*b*	Open a file for update (reading and writing) at end of file.

The meaning of these flags is exactly as specified in *fopen*( ), except that modes beginning with *w* shall not cause truncation of the file.

Additional values for the *mode* argument may be supported by an implementation.

The application shall ensure that the mode of the stream as expressed by the *mode* argument is allowed by the file access mode of the open file description to which *fildes* refers. The file position indicator associated with the new stream is set to the position indicated by the file offset associated with the file descriptor.

The error and end-of-file indicators for the stream shall be cleared. The *fdopen*( ) function may cause the *st_atime* field of the underlying file to be marked for update.

SHM If *fildes* refers to a shared memory object, the result of the *fdopen*( ) function is unspecified.

TYM If *fildes* refers to a typed memory object, the result of the *fdopen*( ) function is unspecified.

The *fdopen*( ) function shall preserve the offset maximum previously set for the open file description corresponding to *fildes*.

RETURN VALUE

Upon successful completion, *fdopen*( ) shall return a pointer to a stream; otherwise, a null pointer shall be returned and *errno* set to indicate the error.

ERRORS

The *fdopen*( ) function may fail if:

[EBADF]	The *fildes* argument is not a valid file descriptor.
[EINVAL]	The *mode* argument is not a valid mode.
[EMFILE]	{FOPEN_MAX} streams are currently open in the calling process.
[EMFILE]	{STREAM_MAX} streams are currently open in the calling process.
[ENOMEM]	Insufficient space to allocate a buffer.

EXAMPLES

None.

APPLICATION USAGE

File descriptors are obtained from calls like *open*( ), *dup*( ), *creat*( ), or *pipe*( ), which open files but do not return streams.

RATIONALE

The file descriptor may have been obtained from *open*( ), *creat*( ), *pipe*( ), *dup*( ), or *fcntl*( ); inherited through *fork*( ) or *exec*; or perhaps obtained by implementation-defined means, such as the 4.3 BSD *socket*( ) call.

The meanings of the *mode* arguments of *fdopen*( ) and *fopen*( ) differ. With *fdopen*( ), open for write (*w* or *w*+) does not truncate, and append (*a* or *a*+) cannot create for writing. The *mode* argument formats that include a *b* are allowed for consistency with the ISO C standard function *fopen*( ). The *b* has no effect on the resulting stream. Although not explicitly required by this volume of IEEE Std 1003.1-200x, a good implementation of append (*a*) mode would cause the O_APPEND flag to be set.

FUTURE DIRECTIONS

None.

SEE ALSO

fclose( ), *fopen*( ), *open*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**, Section 2.5.1 (on page 485)

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the use and setting of the *mode* argument are changed to include binary streams.
- In the DESCRIPTION, text is added for large file support to indicate setting of the offset maximum in the open file description.
- All errors identified in the ERRORS section are added.
- In the DESCRIPTION, text is added that the *fdopen*( ) function may cause *st_atime* to be updated.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that it is the responsibility of the application to ensure that the mode is compatible with the open file descriptor.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *fdopen*( ) results are unspecified for typed memory objects.

NAME

feclearexcept — clear floating-point exception

SYNOPSIS

```
#include <fenv.h>

int feclearexcept(int excepts);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *feclearexcept*( ) function shall attempt to clear the supported floating-point exceptions represented by *excepts*. |

RETURN VALUE

If the argument is zero or if all the specified exceptions were successfully cleared, *feclearexcept*( ) shall return zero. Otherwise, it shall return a non-zero value. |

ERRORS

No errors are defined.

NAME

fegetenv, fesetenv — get and set current floating-point environment

SYNOPSIS

```
#include <fenv.h>

int fegetenv(fenv_t *envp);
int fesetenv(const fenv_t *envp);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fegetenv*( ) function shall attempt to store the current floating-point environment in the object pointed to by *envp*. |

The *fesetenv*( ) function shall attempt to establish the floating-point environment represented by the object pointed to by *envp*. The argument *envp* shall point to an object set by a call to *fegetenv*( ) or *feholdexcept*( ), or equal a floating-point environment macro. The *fesetenv*( ) function does not raise floating-point exceptions, but only installs the state of the floating-point status flags represented through its argument. |

RETURN VALUE

If the representation was successfully stored, *fegetenv*( ) shall return zero. Otherwise, it shall return a non-zero value. If the environment was successfully established, *fesetenv*( ) shall return zero. Otherwise, it shall return a non-zero value. |

ERRORS

No errors are defined.

NAME

fegetexceptflag, fesetexceptflag — get and set floating-point status flags

SYNOPSIS

```
#include <fenv.h>

int fegetexceptflag(fexcept_t *flagp, int excepts);
int fesetexceptflag(const fexcept_t *flagp, int excepts);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fegetexceptflag*( ) function shall attempt to store an implementation-defined representation of the states of the floating-point status flags indicated by the argument *excepts* in the object pointed to by the argument *flagp*.

The *fesetexceptflag*( ) function shall attempt to set the floating-point status flags indicated by the argument excepts to the states stored in the object pointed to by *flagp*. The value pointed to by *flagp* shall have been set by a previous call to *fegetexceptflag*( ) whose second argument represented at least those floating-point exceptions represented by the argument *excepts*. This function does not raise floating-point exceptions, but only sets the state of the flags.

RETURN VALUE

If the representation was successfully stored, *fegetexceptflag*( ) shall return zero. Otherwise, it shall return a non-zero value. If the *excepts* argument is zero or if all the specified execptions were successfully set, *fesetexceptflag*( ) shall return zero. Otherwise, it shall return a non-zero value.

ERRORS

No errors are defined.

NAME

fegetround, fesetround — get and set current rounding direction

SYNOPSIS

```
#include <fenv.h>

int fegetround(void);
int fesetround(int round);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fegetround*( ) function shall get the current rounding direction.

The *fesetround*( ) function shall establish the rounding direction represented by its argument *round*. If the argument is not equal to the value of a rounding direction macro, the rounding direction is not changed.

RETURN VALUE

The *fegetround*( ) function shall return the value of the rounding direction macro representing the current rounding direction or a negative value if there is no such rounding direction macro or the current rounding direction is not determinable.

The *fesetround*( ) function shall return a zero value if and only if the requested rounding direction was established. |

ERRORS

No errors are defined.

EXAMPLES

The following example saves, sets, and restores the rounding direction, reporting an error and aborting if setting the rounding direction fails:

```
#include <fenv.h>
#include <assert.h>
void f(int round_dir)
{
    #pragma STDC FENV_ACCESS ON
    int save_round;
    int setround_ok;
    save_round = fegetround();
    setround_ok = fesetround(round_dir);
    assert(setround_ok == 0);
    /* ... */
    fesetround(save_round);
    /* ... */
}
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

feholdexcept — save current floating-point environment

SYNOPSIS

```
#include <fenv.h>

int feholdexcept(fenv_t *envp);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *feholdexcept*( ) function shall save the current floating-point environment in the object pointed to by *envp*, clear the floating-point status flags, and then install a non-stop (continue on floating-point exceptions) mode, if available, for all floating-point exceptions.

RETURN VALUE

The *feholdexcept*( ) function shall return zero if and only if non-stop floating-point exception handling was successfully installed.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *feholdexcept*( ) function should be effective on typical IEC 60559:1989 standard implementations which have the default non-stop mode and at least one other mode for trap handling or aborting. If the implementation provides only the non-stop mode, then installing the non-stop mode is trivial.

FUTURE DIRECTIONS

None.

SEE ALSO

fegetenv( ), *fesetenv*( ), *feupdateenv*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<fenv.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

NAME

feof — test end-of-file indicator on a stream

SYNOPSIS

```
#include <stdio.h>

int feof(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *feof*( ) function shall test the end-of-file indicator for the stream pointed to by *stream*.

RETURN VALUE

The *feof*( ) function shall return non-zero if and only if the end-of-file indicator is set for *stream*.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

NAME

feraiseexcept — raise floating-point exception

SYNOPSIS

```
#include <fenv.h>

int feraiseexcept(int excepts);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *feraiseexcept*( ) function shall attempt to raise the supported floating-point exceptions represented by the argument *excepts*. The order in which these floating-point exceptions are raised is unspecified. Whether the *feraiseexcept*( ) function additionally raises the inexact floating-point exception whenever it raises the overflow or underflow floating-point exception is implementation-defined. |

RETURN VALUE

If the argument is zero or if all the specified exceptions were successfully raised, *feraiseexcept*( ) shall return zero. Otherwise, it shall return a non-zero value. |

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The effect is intended to be similar to that of floating-point exceptions raised by arithmetic operations. Hence, enabled traps for floating-point exceptions raised by this function are taken.

RATIONALE

Raising overflow or underflow is allowed to also raise inexact because on some architectures the only practical way to raise an exception is to execute an instruction that has the exception as a side effect. The function is not restricted to accept only valid coincident expressions for atomic operations, so the function can be used to raise exceptions accrued over several operations.

FUTURE DIRECTIONS

None.

NAME

ferror — test error indicator on a stream

SYNOPSIS

```
#include <stdio.h>

int ferror(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *ferror*( ) function shall test the error indicator for the stream pointed to by *stream*.

RETURN VALUE

The *ferror*( ) function shall return non-zero if and only if the error indicator is set for *stream*.

ERRORS

No errors are defined.

NAME

fesetenv — set current floating-point environment

SYNOPSIS

```
#include <fenv.h>

int fesetenv(const fenv_t *envp);
```

DESCRIPTION

Refer to *fegetenv*( ).

NAME

fesetexceptflag — set floating-point status flags

SYNOPSIS

```
#include <fenv.h>

int fesetexceptflag(const fexcept_t *flagp, int excepts);
```

DESCRIPTION

Refer to *fegetexceptflag*( ).

NAME

fesetround — set current rounding direction

SYNOPSIS

```
#include <fenv.h>

int fesetround(int round);
```

DESCRIPTION

Refer to *fegetround*( ).

NAME

fetestexcept — test floating-point exception flags

SYNOPSIS

```
#include <fenv.h>

int fetestexcept(int excepts);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fetestexcept*( ) function shall determine which of a specified subset of the floating-point exception flags are currently set. The *excepts* argument specifies the floating-point status flags to be queried.

RETURN VALUE

The *fetestexcept*( ) function shall return the value of the bitwise-inclusive OR of the floating-point exception macros corresponding to the currently set floating-point exceptions included in *excepts*.

ERRORS

No errors are defined.

EXAMPLES

The following example calls function *f*( ) if an invalid exception is set, and then function *g*( ) if an overflow exception is set:

```
#include <fenv.h>
/* ... */
{
    #pragma STDC FENV_ACCESS ON
    int set_excepts;
    feclearexcept(FE_INVALID | FE_OVERFLOW);
    // maybe raise exceptions
    set_excepts = fetestexcept(FE_INVALID | FE_OVERFLOW);
    if (set_excepts & FE_INVALID) f();
    if (set_excepts & FE_OVERFLOW) g();
    /* ... */
}
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

feupdateenv — update floating-point environment

SYNOPSIS

```
#include <fenv.h>

int feupdateenv(const fenv_t *envp);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *feupdateenv*( ) function shall attempt to save the currently raised floating-point exceptions in its automatic storage, attempt to install the floating-point environment represented by the object pointed to by *envp*, and then attempt to raise the saved floating-point exceptions. The argument *envp* shall point to an object set by a call to *feholdexcept*( ) or *fegetenv*( ), or equal a floating-point environment macro.

RETURN VALUE

The *feupdateenv*( ) function shall return a zero value if and only if all the required actions were successfully carried out.

ERRORS

No errors are defined.

EXAMPLES

The following example shows sample code to hide spurious underflow floating-point exceptions:

```
#include <fenv.h>
double f(double x)
{
    #pragma STDC FENV_ACCESS ON
    double result;
    fenv_t save_env;
    feholdexcept(&save_env);
    // compute result
    if (/* test spurious underflow */)
    feclearexcept(FE_UNDERFLOW);
    feupdateenv(&save_env);
    return result;
}
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

fflush — flush a stream

SYNOPSIS

```
#include <stdio.h>

int fflush(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

CX If *stream* points to an output stream or an update stream in which the most recent operation was not input, *fflush*( ) shall cause any unwritten data for that stream to be written to the file, and the *st_ctime* and *st_mtime* fields of the underlying file shall be marked for update.

If *stream* is a null pointer, *fflush*( ) shall perform this flushing action on all streams for which the behavior is defined above.

RETURN VALUE

CX Upon successful completion, *fflush*( ) shall return 0; otherwise, it shall set the error indicator for the stream, return EOF, and set *errno* to indicate the error.

ERRORS

The *fflush*( ) function shall fail if:

CX	[EAGAIN]	The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the process would be delayed in the write operation.
CX	[EBADF]	The file descriptor underlying *stream* is not valid.
CX	[EFBIG]	An attempt was made to write a file that exceeds the maximum file size.
XSI	[EFBIG]	An attempt was made to write a file that exceeds the process' file size limit.
CX	[EFBIG]	The file is a regular file and an attempt was made to write at or beyond the offset maximum associated with the corresponding stream.
CX	[EINTR]	The *fflush*( ) function was interrupted by a signal.
CX	[EIO]	The process is a member of a background process group attempting to write to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.
CX	[ENOSPC]	There was no free space remaining on the device containing the file.
CX	[EPIPE]	An attempt is made to write to a pipe or FIFO that is not open for reading by any process. A SIGPIPE signal shall also be sent to the thread.

The *fflush*( ) function may fail if:

CX	[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.

EXAMPLES

Sending Prompts to Standard Output

The following example uses *printf*( ) calls to print a series of prompts for information the user must enter from standard input. The *fflush*( ) calls force the output to standard output. The *fflush*( ) function is used because standard output is usually buffered and the prompt may not immediately be printed on the output or terminal. The *gets*( ) calls read strings from standard input and place the results in variables, for use later in the program

```
#include <stdio.h>
...
char user[100];
char oldpasswd[100];
char newpasswd[100];
...
printf("User name: ");
fflush(stdout);
gets(user);

printf("Old password: ");
fflush(stdout);
gets(oldpasswd);

printf("New password: ");
fflush(stdout);
gets(newpasswd);
...
```

APPLICATION USAGE

None.

RATIONALE

Data buffered by the system may make determining the validity of the position of the current file descriptor impractical. Thus, enforcing the repositioning of the file descriptor after *fflush*( ) on streams open for *read*( ) is not mandated by IEEE Std 1003.1-200x.

FUTURE DIRECTIONS

None.

getrlimit( ), *ulimit*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EFBIG] error is added as part of the large file support extensions.
- The [ENXIO] optional error condition is added.

The RETURN VALUE section is updated to note that the error indicator shall be set for the stream. This is for alignment with the ISO/IEC 9899:1999 standard.

NAME

ffs — find first set bit

SYNOPSIS

XSI

```
#include <strings.h>

int ffs(int i);
```

DESCRIPTION

The *ffs*( ) function shall find the first bit set (beginning with the least significant bit) in *i*, and return the index of that bit. Bits are numbered starting at one (the least significant bit).

RETURN VALUE

The *ffs*( ) function shall return the index of the first bit set. If *i* is 0, then *ffs*( ) shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

NAME

fgetc — get a byte from a stream

SYNOPSIS

```
#include <stdio.h>

int fgetc(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

If the end-of-file indicator for the input stream pointed to by *stream* is not set and a next byte is present, the *fgetc*( ) function shall obtain the next byte as an **unsigned char** converted to an **int**, from the input stream pointed to by *stream*, and advance the associated file position indicator for the stream (if defined). Since *fgetc*( ) operates on bytes, reading a character consisting of multiple bytes (or ‘‘a multi-byte character’’) may require multiple calls to *fgetc*( ).

CX The *fgetc*( ) function may mark the *st_atime* field of the file associated with *stream* for update. The *st_atime* field shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ), *fgetwc*( ), *fgetws*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *gets*( ), or *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ) or *ungetwc*( ).

RETURN VALUE

Upon successful completion, *fgetc*( ) shall return the next byte from the input stream pointed to by *stream*. If the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and *fgetc*( ) shall return EOF. If a read error occurs, the error indicator for the stream shall be set, *fgetc*( ) shall return EOF, CX and shall set *errno* to indicate the error.

ERRORS

The *fgetc*( ) function shall fail if data needs to be read and:

CX	[EAGAIN]	The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the process would be delayed in the *fgetc*( ) operation.
CX	[EBADF]	The file descriptor underlying *stream* is not a valid file descriptor open for reading.
CX	[EINTR]	The read operation was terminated due to the receipt of a signal, and no data was transferred.
CX	[EIO]	A physical I/O error has occurred, or the process is in a background process group attempting to read from its controlling terminal, and either the process is ignoring or blocking the SIGTTIN signal or the process group is orphaned. This error may also be generated for implementation-defined reasons.
CX	[EOVERFLOW]	The file is a regular file and an attempt was made to read at or beyond the offset maximum associated with the corresponding stream.

The *fgetc*( ) function may fail if:

CX	[ENOMEM]	Insufficient storage space is available.
CX	[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.

EXAMPLES

None.

APPLICATION USAGE

If the integer value returned by *fgetc*( ) is stored into a variable of type **char** and then compared against the integer constant EOF, the comparison may never succeed, because sign-extension of a variable of type **char** on widening to integer is implementation-defined.

The *ferror*( ) or *feof*( ) functions must be used to distinguish between an error condition and an end-of-file condition.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

feof( ), *ferror*( ), *fopen*( ), *getchar*( ), *getc*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- The [ENOMEM] and [ENXIO] optional error conditions are added.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The DESCRIPTION is updated to clarify the behavior when the end-of-file indicator for the input stream is not set.
- The RETURN VALUE section is updated to note that the error indicator shall be set for the stream.

NAME

fgetpos — get current file position information

SYNOPSIS

```
#include <stdio.h>

int fgetpos(FILE *restrict stream, fpos_t *restrict pos);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fgetpos*( ) function shall store the current values of the parse state (if any) and file position indicator for the stream pointed to by *stream* in the object pointed to by *pos*. The value stored contains unspecified information usable by *fsetpos*( ) for repositioning the stream to its position at the time of the call to *fgetpos*( ).

RETURN VALUE

Upon successful completion, *fgetpos*( ) shall return 0; otherwise, it shall return a non-zero value and set *errno* to indicate the error.

ERRORS

The *fgetpos*( ) function shall fail if:

CX [EOVERFLOW]	The current value of the file position cannot be represented correctly in an object of type **fpos_t**.

The *fgetpos*( ) function may fail if:

CX [EBADF]	The file descriptor underlying *stream* is not valid.
CX [ESPIPE]	The file descriptor underlying *stream* is associated with a pipe, FIFO, or socket.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

fopen( ), *ftell*( ), *rewind*( ), *ungetc*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 4. Derived from the ISO C standard.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] mandatory error condition is added.
- The [EBADF] and [ESPIPE] optional error conditions are added.

An additional [ESPIPE] error condition is added for sockets.

The prototype for *fgetpos*( ) is changed for alignment with the ISO / IEC 9899: 1999 standard.

NAME

fgets — get a string from a stream

SYNOPSIS

```
#include <stdio.h>

char *fgets(char *restrict s, int n, FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fgets*( ) function shall read bytes from *stream* into the array pointed to by *s*, until *n*−1 bytes are read, or a <newline> is read and transferred to *s*, or an end-of-file condition is encountered. The string is then terminated with a null byte.

CX The *fgets*( ) function may mark the *st_atime* field of the file associated with *stream* for update. The *st_atime* field shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ), *fgetwc*( ), *fgetws*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *gets*( ), or *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ) or *ungetwc*( ).

RETURN VALUE

Upon successful completion, *fgets*( ) shall return *s*. If the stream is at end-of-file, the end-of-file indicator for the stream shall be set and *fgets*( ) shall return a null pointer. If a read error occurs, CX the error indicator for the stream shall be set, *fgets*( ) shall return a null pointer, and shall set *errno* to indicate the error.

ERRORS

Refer to *fgetc*( ).

EXAMPLES

Reading Input

The following example uses *fgets*( ) to read each line of input. {LINE_MAX}, which defines the maximum size of the input line, is defined in the **<limits.h>** header.

```
#include <stdio.h>
...
char line[LINE_MAX];
...
while (fgets(line, LINE_MAX, fp) != NULL) {
...
}
...
```

APPLICATION USAGE

Issue 6

Extensions beyond the ISO C standard are now marked.

The prototype for *fgets*( ) is changed for alignment with the ISO / IEC 9899: 1999 standard.

NAME

fgetwc — get a wide-character code from a stream

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

wint_t fgetwc(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fgetwc*( ) function shall obtain the next character (if present) from the input stream pointed to by *stream*, convert that to the corresponding wide-character code, and advance the associated file position indicator for the stream (if defined).

If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

CX The *fgetwc*( ) function may mark the *st_atime* field of the file associated with *stream* for update. The *st_atime* field shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ), *fgetwc*( ), *fgetws*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *gets*( ), or *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ) or *ungetwc*( ).

RETURN VALUE

Upon successful completion, the *fgetwc*( ) function shall return the wide-character code of the character read from the input stream pointed to by *stream* converted to a type **wint_t**. If the stream is at end-of-file, the end-of-file indicator for the stream shall be set and *fgetwc*( ) shall return WEOF. If a read error occurs, the error indicator for the stream shall be set, *fgetwc*( ) shall return WEOF, CX and shall set *errno* to indicate the error. If an encoding error occurs, the error indicator for the stream shall be set, *fgetwc*( ) shall return WEOF, and shall set *errno* to indicate the error.

ERRORS

The *fgetwc*( ) function shall fail if data needs to be read and:

CX	[EAGAIN]	The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the process would be delayed in the *fgetwc*( ) operation.
CX	[EBADF]	The file descriptor underlying *stream* is not a valid file descriptor open for reading.
	[EILSEQ]	The data obtained from the input stream does not form a valid character.
CX	[EINTR]	The read operation was terminated due to the receipt of a signal, and no data was transferred.
CX	[EIO]	A physical I/O error has occurred, or the process is in a background process group attempting to read from its controlling terminal, and either the process is ignoring or blocking the SIGTTIN signal or the process group is orphaned. This error may also be generated for implementation-defined reasons.
CX	[EOVERFLOW]	The file is a regular file and an attempt was made to read at or beyond the offset maximum associated with the corresponding stream.

The *fgetwc*( ) function may fail if:

CX	[ENOMEM]	Insufficient storage space is available.

CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.

EXAMPLES

None.

APPLICATION USAGE

The *ferror*( ) or *feof*( ) functions must be used to distinguish between an error condition and an end-of-file condition.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

feof( ), *ferror*( ), *fopen*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**, **<wchar.h>**

CHANGE HISTORY

First released in Issue 4. Derived from the MSE working draft.

Issue 5

The Optional Header (OH) marking is removed from **<stdio.h>**.

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- The [ENOMEM] and [ENXIO] optional error conditions are added.

NAME

fgetws — get a wide-character string from a stream

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

wchar_t *fgetws(wchar_t *restrict ws, int n,
    FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fgetws*( ) function shall read characters from the *stream*, convert these to the corresponding wide-character codes, place them in the **wchar_t** array pointed to by *ws*, until *n*−1 characters are read, or a <newline> is read, converted, and transferred to *ws*, or an end-of-file condition is encountered. The wide-character string, *ws*, shall then be terminated with a null wide-character code.

If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

CX The *fgetws*( ) function may mark the *st_atime* field of the file associated with *stream* for update. The *st_atime* field shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ), *fgetwc*( ), *fgetws*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *gets*( ), or *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ) or *ungetwc*( ).

RETURN VALUE

Upon successful completion, *fgetws*( ) shall return *ws*. If the stream is at end-of-file, the end-of-file indicator for the stream shall be set and *fgetws*( ) shall return a null pointer. If a read error occurs, the error indicator for the stream shall be set, *fgetws*( ) shall return a null pointer, CX and shall set *errno* to indicate the error.

ERRORS

Refer to *fgetwc*( ).

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

fopen( ), *fread*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**, **<wchar.h>**

CHANGE HISTORY

First released in Issue 4. Derived from the MSE working draft.

Issue 5

The Optional Header (OH) marking is removed from **<stdio.h>**.

Issue 6

Extensions beyond the ISO C standard are now marked.

The prototype for *fgetws*( ) is changed for alignment with the ISO/IEC 9899:1999 standard.

NAME

fileno — map a stream pointer to a file descriptor

SYNOPSIS

CX
```
#include <stdio.h>

int fileno(FILE *stream);
```

DESCRIPTION

The *fileno*( ) function shall return the integer file descriptor associated with the stream pointed to by *stream*.

RETURN VALUE

Upon successful completion, *fileno*( ) shall return the integer value of the file descriptor associated with *stream*. Otherwise, the value −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *fileno*( ) function may fail if:

[EBADF]	The *stream* argument is not a valid stream.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Without some specification of which file descriptors are associated with these streams, it is impossible for an application to set up the streams for another application it starts with *fork*( ) and *exec*. In particular, it would not be possible to write a portable version of the *sh* command interpreter (although there may be other constraints that would prevent that portability).

FUTURE DIRECTIONS

None.

fdopen( ), *fopen*( ), *stdin*, the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**, Section 2.5.1 (on page 485)

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EBADF] optional error condition is added.

NAME

flockfile, ftrylockfile, funlockfile — stdio locking functions

SYNOPSIS

TSF

```
#include <stdio.h>

void flockfile(FILE *file);
int ftrylockfile(FILE *file);
void funlockfile(FILE *file);
```

DESCRIPTION

These functions shall provide for explicit application-level locking of stdio (**FILE ***) objects. These functions can be used by a thread to delineate a sequence of I/O statements that are executed as a unit.

The *flockfile*( ) function shall acquire for a thread ownership of a (**FILE ***) object.

The *ftrylockfile*( ) function shall acquire for a thread ownership of a (**FILE ***) object if the object is available; *ftrylockfile*( ) is a non-blocking version of *flockfile*( ).

The *funlockfile*( ) function shall relinquish the ownership granted to the thread. The behavior is undefined if a thread other than the current owner calls the *funlockfile*( ) function.

The functions shall behave as if there is a lock count associated with each (**FILE ***) object. This count is implicitly initialized to zero when the (**FILE ***) object is created. The (**FILE ***) object is unlocked when the count is zero. When the count is positive, a single thread owns the (**FILE ***) object. When the *flockfile*( ) function is called, if the count is zero or if the count is positive and the caller owns the (**FILE ***) object, the count shall be incremented. Otherwise, the calling thread shall be suspended, waiting for the count to return to zero. Each call to *funlockfile*( ) shall decrement the count. This allows matching calls to *flockfile*( ) (or successful calls to *ftrylockfile*( )) and *funlockfile*( ) to be nested.

All functions that reference (**FILE ***) objects shall behave as if they use *flockfile*( ) and *funlockfile*( ) internally to obtain ownership of these (**FILE ***) objects.

RETURN VALUE

None for *flockfile*( ) and *funlockfile*( ). The *ftrylockfile*( ) function shall return zero for success and non-zero to indicate that the lock cannot be acquired.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Applications using these functions may be subject to priority inversion, as discussed in the Base Definitions volume of IEEE Std 1003.1-200x, Section 3.285, Priority Inversion.

RATIONALE

The *flockfile*( ) and *funlockfile*( ) functions provide an orthogonal mutual exclusion lock for each **FILE**. The *ftrylockfile*( ) function provides a non-blocking attempt to acquire a file lock, analogous to *pthread_mutex_trylock*( ).

These locks behave as if they are the same as those used internally by *stdio* for thread-safety. This both provides thread-safety of these functions without requiring a second level of internal locking and allows functions in *stdio* to be implemented in terms of other *stdio* functions.

Application writers and implementors should be aware that there are potential deadlock problems on **FILE** objects. For example, the line-buffered flushing semantics of *stdio* (requested via {_IOLBF}) require that certain input operations sometimes cause the buffered contents of implementation-defined line-buffered output streams to be flushed. If two threads each hold the lock on the other's **FILE**, deadlock ensues. This type of deadlock can be avoided by acquiring **FILE** locks in a consistent order. In particular, the line-buffered output stream deadlock can typically be avoided by acquiring locks on input streams before locks on output streams if a thread would be acquiring both.

In summary, threads sharing *stdio* streams with other threads can use *flockfile*( ) and *funlockfile*( ) to cause sequences of I/O performed by a single thread to be kept bundled. The only case where the use of *flockfile*( ) and *funlockfile*( ) is required is to provide a scope protecting uses of the *_unlocked*( ) functions/macros. This moves the cost/performance tradeoff to the optimal point.

FUTURE DIRECTIONS

None.

SEE ALSO

getc_unlocked( ), *putc_unlocked*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

These functions are marked as part of the Thread-Safe Functions option.

NAME

floor, floorf, floorl — floor function

SYNOPSIS

```
#include <math.h>

double floor(double x);
float floorf(float x);
long double floorl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the largest integral value not greater than *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the largest integral value not greater than *x*, expressed as a **double**, **float**, or **long double**, as appropriate for the return type of the function.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0 or ±Inf, *x* shall be returned.

XSI If the correct value would cause overflow, a range error shall occur and *floor*( ), *floorf*( ), and *floorl*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

ERRORS

These functions shall fail if:

XSI Range Error The result would cause an overflow.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

The integral value returned by these functions might not be expressible as an **int** or **long**. The return value should be tested before assigning it to an integer type to avoid the undefined results of an integer overflow.

The *floor*( ) function can only overflow when the floating-point representation has DBL_MANT_DIG > DBL_MAX_EXP.

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

ceil( ), *feclearexcept*( ), *fetestexcept*( ), *isnan*( ), the Base Definitions volume of IEEE Std 1003.1-200x, Section 4.18, Treatment of Error Conditions for Mathematical Functions, **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *floorf*( ) and *floorl*( ) functions are added for alignment with the ISO/IEC 9899: 1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are marked.

NAME

fma, fmaf, fmal — floating-point multiply-add

SYNOPSIS

```
#include <math.h>

double fma(double x, double y, double z);
float fmaf(float x, float y, float z);
long double fmal(long double x, long double y, long double z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute $(x * y) + z$, rounded as one ternary operation: they shall compute the value (as if) to infinite precision and round once to the result format, according to the rounding mode characterized by the value of FLT_ROUNDS.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return $(x * y) + z$, rounded as one ternary operation.

MX If *x* or *y* are NaN, a NaN shall be returned.

If *x* multiplied by *y* is an exact infinity and *z* is also an infinity but with the opposite sign, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If one of *x* and *y* is infinite, the other is zero, and *z* is not a NaN, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If one of *x* and *y* is infinite, the other is zero, and *z* is a NaN, a NaN shall be returned and a domain error may occur.

If $x*y$ is not 0*Inf nor Inf*0 and *z* is a NaN, a NaN shall be returned.

ERRORS

These functions shall fail if:

MX Domain Error	The value of $x*y+z$ is invalid, or the value $x*y$ is invalid and *z* is not a NaN.
	If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.
MX Range Error	The result overflows.
	If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

MX	Domain Error	The value *x***y* is invalid and *z* is a NaN. If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.
MX	Range Error	The result underflows. If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

In many cases, clever use of floating (*fused*) multiply-add leads to much improved code; but its unexpected use by the compiler can undermine carefully written code. The FP_CONTRACT macro can be used to disallow use of floating multiply-add; and the *fma*( ) function guarantees its use where desired. Many current machines provide hardware floating multiply-add instructions; software implementation can be used for others.

FUTURE DIRECTIONS

None.

NAME

fmax, fmaxf, fmaxl — determine maximum numeric value of two floating-point numbers

SYNOPSIS

```
#include <math.h>

double fmax(double x, double y);
float fmaxf(float x, float y);
long double fmaxl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall determine the maximum numeric value of their arguments. NaN arguments shall be treated as missing data: if one argument is a NaN and the other numeric, then these functions shall choose the numeric value.

RETURN VALUE

Upon successful completion, these functions shall return the maximum numeric value of their arguments.

If just one argument is a NaN, the other argument shall be returned.

MX If *x* and *y* are NaN, a NaN shall be returned.

ERRORS

No errors are defined.

NAME

fmod, fmodf, fmodl — floating-point remainder value function

SYNOPSIS

```
#include <math.h>

double fmod(double x, double y);
float fmodf(float x, float y);
long double fmodl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall return the floating-point remainder of the division of *x* by *y*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

These functions shall return the value $x-i*y$, for some integer *i* such that, if *y* is non-zero, the result has the same sign as *x* and magnitude less than the magnitude of *y*.

If the correct value would cause underflow, and is not representable, a range error may occur, MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

MX If *x* or *y* is NaN, a NaN shall be returned.

If *y* is zero, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If *x* is infinite, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If *x* is ±0 and *y* is not zero, ±0 shall be returned.

If *x* is not infinite and *y* is ±Inf, *x* shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions shall fail if:

MX Domain Error	The *x* argument is infinite or *y* is zero.
	If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Range Error	The result underflows.
	If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

NAME

fmtmsg — display a message in the specified format on standard error and/or a system console

SYNOPSIS

XSI

```
#include <fmtmsg.h>

int fmtmsg(long classification, const char *label, int severity,
    const char *text, const char *action, const char *tag);
```

DESCRIPTION

The *fmtmsg*( ) function shall display messages in a specified format instead of the traditional *printf*( ) function.

Based on a message's classification component, *fmtmsg*( ) shall write a formatted message either to standard error, to the console, or to both.

A formatted message consists of up to five components as defined below. The component *classification* is not part of a message displayed to the user, but defines the source of the message and directs the display of the formatted message.

classification Contains the sum of identifying values constructed from the constants defined below. Any one identifier from a subclass may be used in combination with a single identifier from a different subclass. Two or more identifiers from the same subclass should not be used together, with the exception of identifiers from the display subclass. (Both display subclass identifiers may be used so that messages can be displayed to both standard error and the system console).

Major Classifications
Identifies the source of the condition. Identifiers are: MM_HARD (hardware), MM_SOFT (software), and MM_FIRM (firmware).

Message Source Subclassifications
Identifies the type of software in which the problem is detected. Identifiers are: MM_APPL (application), MM_UTIL (utility), and MM_OPSYS (operating system).

Display Subclassifications
Indicates where the message is to be displayed. Identifiers are: MM_PRINT to display the message on the standard error stream, MM_CONSOLE to display the message on the system console. One or both identifiers may be used.

Status Subclassifications
Indicates whether the application can recover from the condition. Identifiers are: MM_RECOVER (recoverable) and MM_NRECOV (non-recoverable).

An additional identifier, MM_NULLMC, indicates that no classification component is supplied for the message.

label Identifies the source of the message. The format is two fields separated by a colon. The first field is up to 10 bytes, the second is up to 14 bytes.

severity Indicates the seriousness of the condition. Identifiers for the levels of *severity* are:

MM_HALT	Indicates that the application has encountered a severe fault and is halting. Produces the string `"HALT"`.
MM_ERROR	Indicates that the application has detected a fault. Produces the string `"ERROR"`.
MM_WARNING	Indicates a condition that is out of the ordinary, that might be a problem, and should be watched. Produces the string `"WARNING"`.
MM_INFO	Provides information about a condition that is not in error. Produces the string `"INFO"`.
MM_NOSEV	Indicates that no severity level is supplied for the message.

text	Describes the error condition that produced the message. The character string is not limited to a specific size. If the character string is empty, then the text produced is unspecified.
action	Describes the first step to be taken in the error-recovery process. The *fmtmsg*( ) function precedes the action string with the prefix: `"TO FIX:"`. The *action* string is not limited to a specific size.
tag	An identifier that references on-line documentation for the message. Suggested usage is that *tag* includes the *label* and a unique identifying number. A sample *tag* is `"XSI:cat:146"`.

The *MSGVERB* environment variable (for message verbosity) shall determine for *fmtmsg*( ) which message components it is to select when writing messages to standard error. The value of *MSGVERB* shall be a colon-separated list of optional keywords. Valid *keywords* are: *label*, *severity*, *text*, *action*, and *tag*. If *MSGVERB* contains a keyword for a component and the component's value is not the component's null value, *fmtmsg*( ) shall include that component in the message when writing the message to standard error. If *MSGVERB* does not include a keyword for a message component, that component is shall not be included in the display of the message. The keywords may appear in any order. If *MSGVERB* is not defined, if its value is the null string, if its value is not of the correct format, or if it contains keywords other than the valid ones listed above, *fmtmsg*( ) shall select all components.

MSGVERB shall determine which components are selected for display to standard error. All message components shall be included in console messages.

RETURN VALUE

The *fmtmsg*( ) function shall return one of the following values:

MM_OK	The function succeeded.
MM_NOTOK	The function failed completely.
MM_NOMSG	The function was unable to generate a message on standard error, but otherwise succeeded.
MM_NOCON	The function was unable to generate a console message, but otherwise succeeded.

ERRORS

None.

EXAMPLES

1. The following example of *fmtmsg*( ):

   ```
   fmtmsg(MM_PRINT, "XSI:cat", MM_ERROR, "illegal option",
   "refer to cat in user’s reference manual", "XSI:cat:001")
   ```

   produces a complete message in the specified message format:

   ```
   XSI:cat: ERROR: illegal option
   TO FIX: refer to cat in user’s reference manual XSI:cat:001
   ```

2. When the environment variable *MSGVERB* is set as follows:

   ```
   MSGVERB=severity:text:action
   ```

   and Example 1 is used, *fmtmsg*( ) produces:

   ```
   ERROR: illegal option
   TO FIX: refer to cat in user’s reference manual
   ```

APPLICATION USAGE

One or more message components may be systematically omitted from messages generated by an application by using the null value of the argument for that component.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

NAME

fnmatch — match a filename or a pathname

SYNOPSIS

```
#include <fnmatch.h>

int fnmatch(const char *pattern, const char *string, int flags);
```

DESCRIPTION

The *fnmatch*( ) function shall match patterns as described in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.13.1, Patterns Matching a Single Character, and Section 2.13.2, Patterns Matching Multiple Characters. It checks the string specified by the *string* argument to see if it matches the pattern specified by the *pattern* argument.

The *flags* argument shall modify the interpretation of *pattern* and *string*. It is the bitwise-inclusive OR of zero or more of the flags defined in **<fnmatch.h>**. If the FNM_PATHNAME flag is set in *flags*, then a slash character (`'/'`) in *string* shall be explicitly matched by a slash in *pattern*; it shall not be matched by either the asterisk or question-mark special characters, nor by a bracket expression. If the FNM_PATHNAME flag is not set, the slash character shall be treated as an ordinary character.

If FNM_NOESCAPE is not set in *flags*, a backslash character (`'\'`) in *pattern* followed by any other character shall match that second character in *string*. In particular, `"\\"` shall match a backslash in *string*. If FNM_NOESCAPE is set, a backslash character shall be treated as an ordinary character.

If FNM_PERIOD is set in *flags*, then a leading period (`'.'`) in *string* shall match a period in *pattern*; as described by rule 2 in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.13.3, Patterns Used for Filename Expansion where the location of ‘‘leading’’ is indicated by the value of FNM_PATHNAME:

- If FNM_PATHNAME is set, a period is ‘‘leading’’ if it is the first character in *string* or if it immediately follows a slash.
- If FNM_PATHNAME is not set, a period is ‘‘leading’’ only if it is the first character of *string*.

If FNM_PERIOD is not set, then no special restrictions are placed on matching a period.

RETURN VALUE

If *string* matches the pattern specified by *pattern*, then *fnmatch*( ) shall return 0. If there is no match, *fnmatch*( ) shall return FNM_NOMATCH, which is defined in **<fnmatch.h>**. If an error occurs, *fnmatch*( ) shall return another non-zero value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *fnmatch*( ) function has two major uses. It could be used by an application or utility that needs to read a directory and apply a pattern against each entry. The *find* utility is an example of this. It can also be used by the *pax* utility to process its *pattern* operands, or by applications that need to match strings in a similar manner.

The name *fnmatch*( ) is intended to imply *filename* match, rather than *pathname* match. The default action of this function is to match filenames, rather than pathnames, since it gives no special significance to the slash character. With the FNM_PATHNAME flag, *fnmatch*( ) does match pathnames, but without tilde expansion, parameter expansion, or special treatment for a period at the beginning of a filename.

RATIONALE

This function replaced the REG_FILENAME flag of *regcomp*( ) in early proposals of this volume of IEEE Std 1003.1-200x. It provides virtually the same functionality as the *regcomp*( ) and *regexec*( ) functions using the REG_FILENAME and REG_FSLASH flags (the REG_FSLASH flag was proposed for *regcomp*( ), and would have had the opposite effect from FNM_PATHNAME), but with a simpler function and less system overhead.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

Moved from POSIX2 C-language Binding to BASE.

NAME

fopen — open a stream

SYNOPSIS

```
#include <stdio.h>

FILE *fopen(const char *restrict filename, const char *restrict mode);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fopen*( ) function shall open the file whose pathname is the string pointed to by *filename*, and associates a stream with it.

The *mode* argument points to a string. If the string is one of the following, the file shall be opened in the indicated mode. Otherwise, the behavior is undefined.

r or *rb*	Open file for reading.
w or *wb*	Truncate to zero length or create file for writing.
a or *ab*	Append; open or create file for writing at end-of-file.
r+ or *rb*+ or *r*+*b*	Open file for update (reading and writing).
w+ or *wb*+ or *w*+*b*	Truncate to zero length or create file for update.
a+ or *ab*+ or *a*+*b*	Append; open or create file for update, writing at end-of-file.

CX The character `'b'` shall have no effect, but is allowed for ISO C standard conformance. Opening a file with read mode (*r* as the first character in the *mode* argument) shall fail if the file does not exist or cannot be read.

Opening a file with append mode (*a* as the first character in the *mode* argument) shall cause all subsequent writes to the file to be forced to the then current end-of-file, regardless of intervening calls to *fseek*( ).

When a file is opened with update mode (`'+'` as the second or third character in the *mode* argument), both input and output may be performed on the associated stream. However, the application shall ensure that output is not directly followed by input without an intervening call to *fflush*( ) or to a file positioning function (*fseek*( ), *fsetpos*( ), or *rewind*( )), and input is not directly followed by output without an intervening call to a file positioning function, unless the input operation encounters end-of-file.

When opened, a stream is fully buffered if and only if it can be determined not to refer to an interactive device. The error and end-of-file indicators for the stream shall be cleared.

CX If *mode* is *w*, *wb*, *a*, *ab*, *w*+, *wb*+, *w*+*b*, *a*+, *ab*+, or *a*+*b*, and the file did not previously exist, upon successful completion, *fopen*( ) function shall mark for update the *st_atime*, *st_ctime*, and *st_mtime* fields of the file and the *st_ctime* and *st_mtime* fields of the parent directory.

If *mode* is *w*, *wb*, *w*+, *wb*+, or *w*+*b*, and the file did previously exist, upon successful completion, *fopen*( ) shall mark for update the *st_ctime* and *st_mtime* fields of the file. The *fopen*( ) function shall allocate a file descriptor as *open*( ) does.

XSI After a successful call to the *fopen*( ) function, the orientation of the stream shall be cleared, the encoding rule shall be cleared, and the associated **mbstate_t** object shall be set to describe an initial conversion state.

CX The largest value that can be represented correctly in an object of type **off_t** shall be established as the offset maximum in the open file description.

RETURN VALUE

Upon successful completion, *fopen*( ) shall return a pointer to the object controlling the stream. Otherwise, a null pointer shall be returned, CX and *errno* shall be set to indicate the error.

ERRORS

The *fopen*( ) function shall fail if:

CX	[EACCES]	Search permission is denied on a component of the path prefix, or the file exists and the permissions specified by *mode* are denied, or the file does not exist and write permission is denied for the parent directory of the file to be created.
CX	[EINTR]	A signal was caught during *fopen*( ).
CX	[EISDIR]	The named file is a directory and *mode* requires write access.
CX	[ELOOP]	A loop exists in symbolic links encountered during resolution of the *path* argument.
CX	[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
CX	[ENAMETOOLONG]	The length of the *filename* argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
CX	[ENFILE]	The maximum allowable number of files is currently open in the system.
CX	[ENOENT]	A component of *filename* does not name an existing file or *filename* is an empty string.
CX	[ENOSPC]	The directory or file system that would contain the new file cannot be expanded, the file does not exist, and it was to be created.
CX	[ENOTDIR]	A component of the path prefix is not a directory.
CX	[ENXIO]	The named file is a character special or block special file, and the device associated with this special file does not exist.
CX	[EOVERFLOW]	The named file is a regular file and the size of the file cannot be represented correctly in an object of type **off_t**.
CX	[EROFS]	The named file resides on a read-only file system and *mode* requires write access.

The *fopen*( ) function may fail if:

CX	[EINVAL]	The value of the *mode* argument is not valid.
CX	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.
CX	[EMFILE]	{FOPEN_MAX} streams are currently open in the calling process.
CX	[EMFILE]	{STREAM_MAX} streams are currently open in the calling process.
CX	[ENAMETOOLONG]	Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.

CX	[ENOMEM]	Insufficient storage space is available.
CX	[ETXTBSY]	The file is a pure procedure (shared text) file that is being executed and *mode* requires write access.

EXAMPLES

Opening a File

The following example tries to open the file named **file** for reading. The *fopen*( ) function returns a file pointer that is used in subsequent *fgets*( ) and *fclose*( ) calls. If the program cannot open the file, it just ignores it.

```
#include <stdio.h>
...
FILE *fp;
...
void rgrep(const char *file)
{
...
    if ((fp = fopen(file, "r")) == NULL)
        return;
...
}
```

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support large files.
- The [ELOOP] mandatory error condition is added.
- The [EINVAL], [EMFILE], [ENAMETOOLONG], [ENOMEM], and [ETXTBSY] optional error conditions are added.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The prototype for *fopen*( ) is updated.
- The DESCRIPTION is updated to note that if the argument *mode* points to a string other than those listed, then the behavior is undefined.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

NAME

fork — create a new process

SYNOPSIS

```
#include <unistd.h>

pid_t fork(void);
```

DESCRIPTION

The *fork*( ) function shall create a new process. The new process (child process) shall be an exact copy of the calling process (parent process) except as detailed below:

- The child process shall have a unique process ID.
- The child process ID also shall not match any active process group ID.
- The child process shall have a different parent process ID, which shall be the process ID of the calling process.
- The child process shall have its own copy of the parent's file descriptors. Each of the child's file descriptors shall refer to the same open file description with the corresponding file descriptor of the parent.
- The child process shall have its own copy of the parent's open directory streams. Each open directory stream in the child process may share directory stream positioning with the corresponding directory stream of the parent.
- XSI The child process shall have its own copy of the parent's message catalog descriptors.
- The child process' values of *tms_utime*, *tms_stime*, *tms_cutime*, and *tms_cstime* shall be set to 0.
- The time left until an alarm clock signal shall be reset to zero, and the alarm, if any, shall be canceled; see *alarm*( ).
- XSI All *semadj* values shall be cleared.
- File locks set by the parent process shall not be inherited by the child process.
- The set of signals pending for the child process shall be initialized to the empty set.
- XSI Interval timers shall be reset in the child process.
- SEM Any semaphores that are open in the parent process shall also be open in the child process.
- ML The child process shall not inherit any address space memory locks established by the parent process via calls to *mlockall*( ) or *mlock*( ).
- MF|SHM Memory mappings created in the parent shall be retained in the child process. MAP_PRIVATE mappings inherited from the parent shall also be MAP_PRIVATE mappings in the child, and any modifications to the data in these mappings made by the parent prior to calling *fork*( ) shall be visible to the child. Any modifications to the data in MAP_PRIVATE mappings made by the parent after *fork*( ) returns shall be visible only to the parent. Modifications to the data in MAP_PRIVATE mappings made by the child shall be visible only to the child.
- PS For the SCHED_FIFO and SCHED_RR scheduling policies, the child process shall inherit the policy and priority settings of the parent process during a *fork*( ) function. For other scheduling policies, the policy and priority settings on *fork*( ) are implementation-defined.
- TMR Per-process timers created by the parent shall not be inherited by the child process.
- MSG The child process shall have its own copy of the message queue descriptors of the parent. Each of the message descriptors of the child shall refer to the same open message queue

description as the corresponding message descriptor of the parent.

- AIO No asynchronous input or asynchronous output operations shall be inherited by the child process.
- A process shall be created with a single thread. If a multi-threaded process calls *fork*( ), the new process shall contain a replica of the calling thread and its entire address space, possibly including the states of mutexes and other resources. Consequently, to avoid errors, the child process may only execute async-signal-safe operations until such time as one of the *exec* functions is called. THR Fork handlers may be established by means of the *pthread_atfork*( ) function in order to maintain application invariants across *fork*( ) calls.
- TRC TRI If the Trace option and the Trace Inherit option are both supported:

  If the calling process was being traced in a trace stream that had its inheritance policy set to POSIX_TRACE_INHERITED, the child process shall be traced into that trace stream, and the child process shall inherit the parent's mapping of trace event names to trace event type identifiers. If the trace stream in which the calling process was being traced had its inheritance policy set to POSIX_TRACE_CLOSE_FOR_CHILD, the child process shall not be traced into that trace stream. The inheritance policy is set by a call to the *posix_trace_attr_setinherited*( ) function.
- TRC If the Trace option is supported, but the Trace Inherit option is not supported:

  The child process shall not be traced into any of the trace streams of its parent process.
- TRC If the Trace option is supported, the child process of a trace controller process shall not control the trace streams controlled by its parent process.
- CPT The initial value of the CPU-time clock of the child process shall be set to zero.
- TCT The initial value of the CPU-time clock of the single thread of the child process shall be set to zero.

All other process characteristics defined by IEEE Std 1003.1-200x shall be the same in the parent and child processes. The inheritance of process characteristics not defined by IEEE Std 1003.1-200x is unspecified by IEEE Std 1003.1-200x.

After *fork*( ), both the parent and the child processes shall be capable of executing independently before either one terminates.

RETURN VALUE

Upon successful completion, *fork*( ) shall return 0 to the child process and shall return the process ID of the child process to the parent process. Both processes shall continue to execute from the *fork*( ) function. Otherwise, −1 shall be returned to the parent process, no child process shall be created, and *errno* shall be set to indicate the error.

ERRORS

The *fork*( ) function shall fail if:

[EAGAIN]	The system lacked the necessary resources to create another process, or the system-imposed limit on the total number of processes under execution system-wide or by a single user {CHILD_MAX} would be exceeded.

The *fork*( ) function may fail if:

[ENOMEM]	Insufficient storage space is available.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Many historical implementations have timing windows where a signal sent to a process group (for example, an interactive SIGINT) just prior to or during execution of *fork*( ) is delivered to the parent following the *fork*( ) but not to the child because the *fork*( ) code clears the child's set of pending signals. This volume of IEEE Std 1003.1-200x does not require, or even permit, this behavior. However, it is pragmatic to expect that problems of this nature may continue to exist in implementations that appear to conform to this volume of IEEE Std 1003.1-200x and pass available verification suites. This behavior is only a consequence of the implementation failing to make the interval between signal generation and delivery totally invisible. From the application's perspective, a *fork*( ) call should appear atomic. A signal that is generated prior to the *fork*( ) should be delivered prior to the *fork*( ). A signal sent to the process group after the *fork*( ) should be delivered to both parent and child. The implementation may actually initialize internal data structures corresponding to the child's set of pending signals to include signals sent to the process group during the *fork*( ). Since the *fork*( ) call can be considered as atomic from the application's perspective, the set would be initialized as empty and such signals would have arrived after the *fork*( ); see also **<signal.h>**.

One approach that has been suggested to address the problem of signal inheritance across *fork*( ) is to add an [EINTR] error, which would be returned when a signal is detected during the call. While this is preferable to losing signals, it was not considered an optimal solution. Although it is not recommended for this purpose, such an error would be an allowable extension for an implementation.

The [ENOMEM] error value is reserved for those implementations that detect and distinguish such a condition. This condition occurs when an implementation detects that there is not enough memory to create the process. This is intended to be returned when [EAGAIN] is inappropriate because there can never be enough memory (either primary or secondary storage) to perform the operation. Since *fork*( ) duplicates an existing process, this must be a condition where there is sufficient memory for one such process, but not for two. Many historical implementations actually return [ENOMEM] due to temporary lack of memory, a case that is not generally distinct from [EAGAIN] from the perspective of a conforming application.

Part of the reason for including the optional error [ENOMEM] is because the SVID specifies it and it should be reserved for the error condition specified there. The condition is not applicable on many implementations.

IEEE Std 1003.1-1988 neglected to require concurrent execution of the parent and child of *fork*( ). A system that single-threads processes was clearly not intended and is considered an unacceptable "toy implementation" of this volume of IEEE Std 1003.1-200x. The only objection anticipated to the phrase "executing independently" is testability, but this assertion should be testable. Such tests require that both the parent and child can block on a detectable action of the other, such as a write to a pipe or a signal. An interactive exchange of such actions should be possible for the system to conform to the intent of this volume of IEEE Std 1003.1-200x.

The [EAGAIN] error exists to warn applications that such a condition might occur. Whether it occurs or not is not in any practical sense under the control of the application because the condition is usually a consequence of the user's use of the system, not of the application's code. Thus, no application can or should rely upon its occurrence under any circumstances, nor should the exact semantics of what concept of "user" is used be of concern to the application writer. Validation writers should be cognizant of this limitation.

There are two reasons why POSIX programmers call *fork*( ). One reason is to create a new thread of control within the same program (which was originally only possible in POSIX by creating a new process); the other is to create a new process running a different program. In the latter case, the call to *fork*( ) is soon followed by a call to one of the *exec* functions.

The general problem with making *fork*( ) work in a multi-threaded world is what to do with all of the threads. There are two alternatives. One is to copy all of the threads into the new process. This causes the programmer or implementation to deal with threads that are suspended on system calls or that might be about to execute system calls that should not be executed in the new process. The other alternative is to copy only the thread that calls *fork*( ). This creates the difficulty that the state of process-local resources is usually held in process memory. If a thread that is not calling *fork*( ) holds a resource, that resource is never released in the child process because the thread whose job it is to release the resource does not exist in the child process.

When a programmer is writing a multi-threaded program, the first described use of *fork*( ), creating new threads in the same program, is provided by the *pthread_create*( ) function. The *fork*( ) function is thus used only to run new programs, and the effects of calling functions that require certain resources between the call to *fork*( ) and the call to an *exec* function are undefined.

The addition of the *forkall*( ) function to the standard was considered and rejected. The *forkall*( ) function lets all the threads in the parent be duplicated in the child. This essentially duplicates the state of the parent in the child. This allows threads in the child to continue processing and allows locks and the state to be preserved without explicit *pthread_atfork*( ) code. The calling process has to ensure that the threads processing state that is shared between the parent and child (that is, file descriptors or MAP_SHARED memory) behaves properly after *forkall*( ). For example, if a thread is reading a file descriptor in the parent when *forkall*( ) is called, then two threads (one in the parent and one in the child) are reading the file descriptor after the *forkall*( ). If this is not desired behavior, the parent process has to synchronize with such threads before calling *forkall*( ).

When *forkall*( ) is called, threads, other than the calling thread, that are in POSIX System Interfaces functions that can return with an [EINTR] error may have those functions return [EINTR] if the implementation cannot ensure that the function behaves correctly in the parent and child. In particular, *pthread_cond_wait*( ) and *pthread_cond_timedwait*( ) need to return in order to ensure that the condition has not changed. These functions can be awakened by a spurious condition wakeup rather than returning [EINTR].

FUTURE DIRECTIONS

None.

alarm( ), *exec*, *fcntl*( ), *posix_trace_attr_getinherited*( ), *posix_trace_trid_eventid_open*( ), *semop*( ), *signal*( ), *times*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is changed for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The effect of *fork*( ) on a pending alarm call in the child process is clarified.

The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

NAME

fpathconf, pathconf — get configurable pathname variables

SYNOPSIS

```
#include <unistd.h>

long fpathconf(int fildes, int name);
long pathconf(const char *path, int name);
```

DESCRIPTION

The *fpathconf*( ) and *pathconf*( ) functions shall determine the current value of a configurable limit or option (*variable*) that is associated with a file or directory.

For *pathconf*( ), the *path* argument points to the pathname of a file or directory.

For *fpathconf*( ), the *fildes* argument is an open file descriptor.

The *name* argument represents the variable to be queried relative to that file or directory. Implementations shall support all of the variables listed in the following table and may support others. The variables in the following table come from **<limits.h>** or **<unistd.h>** and the symbolic constants, defined in **<unistd.h>**, are the corresponding values used for *name*. Support for some pathname configuration variables is dependent on implementation options (see shading and margin codes in the table below). Where an implementation option is not supported, the variable need not be supported.

	Variable	Value of *name*	Requirements
	{FILESIZEBITS}	_PC_FILESIZEBITS	3, 4
	{LINK_MAX}	_PC_LINK_MAX	1
	{MAX_CANON}	_PC_MAX_CANON	2
	{MAX_INPUT}	_PC_MAX_INPUT	2
	{NAME_MAX}	_PC_NAME_MAX	3, 4
	{PATH_MAX}	_PC_PATH_MAX	4, 5
	{PIPE_BUF}	_PC_PIPE_BUF	6
ADV	{POSIX_ALLOC_SIZE_MIN}	_PC_ALLOC_SIZE_MIN	
ADV	{POSIX_REC_INCR_XFER_SIZE}	_PC_REC_INCR_XFER_SIZE	
ADV	{POSIX_REC_MAX_XFER_SIZE}	_PC_REC_MAX_XFER_SIZE	
ADV	{POSIX_REC_MIN_XFER_SIZE}	_PC_REC_MIN_XFER_SIZE	
ADV	{POSIX_REC_XFER_ALIGN}	_PC_REC_XFER_ALIGN	
	{SYMLINK_MAX}	_PC_SYMLINK_MAX	4, 9
	_POSIX_CHOWN_RESTRICTED	_PC_CHOWN_RESTRICTED	7
	_POSIX_NO_TRUNC	_PC_NO_TRUNC	3, 4
	_POSIX_VDISABLE	_PC_VDISABLE	2
	_POSIX_ASYNC_IO	_PC_ASYNC_IO	8
	_POSIX_PRIO_IO	_PC_PRIO_IO	8
	_POSIX_SYNC_IO	_PC_SYNC_IO	8

Requirements

1. If *path* or *fildes* refers to a directory, the value returned shall apply to the directory itself.
2. If *path* or *fildes* does not refer to a terminal file, it is unspecified whether an implementation supports an association of the variable name with the specified file.
3. If *path* or *fildes* refers to a directory, the value returned shall apply to filenames within the directory.
4. If *path* or *fildes* does not refer to a directory, it is unspecified whether an implementation supports an association of the variable name with the specified file.
5. If *path* or *fildes* refers to a directory, the value returned shall be the maximum length of a relative pathname when the specified directory is the working directory.
6. If *path* refers to a FIFO, or *fildes* refers to a pipe or FIFO, the value returned shall apply to the referenced object. If *path* or *fildes* refers to a directory, the value returned shall apply to any FIFO that exists or can be created within the directory. If *path* or *fildes* refers to any other type of file, it is unspecified whether an implementation supports an association of the variable name with the specified file.
7. If *path* or *fildes* refers to a directory, the value returned shall apply to any files, other than directories, that exist or can be created within the directory.
8. If *path* or *fildes* refers to a directory, it is unspecified whether an implementation supports an association of the variable name with the specified file.
9. If *path* or *fildes* refers to a directory, the value returned shall be the maximum length of the string that a symbolic link in that directory can contain.

RETURN VALUE

If *name* is an invalid value, both *pathconf*( ) and *fpathconf*( ) shall return −1 and set *errno* to indicate the error.

If the variable corresponding to *name* has no limit for the *path* or file descriptor, both *pathconf*( ) and *fpathconf*( ) shall return −1 without changing *errno*. If the implementation needs to use *path* to determine the value of *name* and the implementation does not support the association of *name* with the file specified by *path*, or if the process did not have appropriate privileges to query the file specified by *path*, or *path* does not exist, *pathconf*( ) shall return −1 and set *errno* to indicate the error.

If the implementation needs to use *fildes* to determine the value of *name* and the implementation does not support the association of *name* with the file specified by *fildes*, or if *fildes* is an invalid file descriptor, *fpathconf*( ) shall return −1 and set *errno* to indicate the error.

Otherwise, *pathconf*( ) or *fpathconf*( ) shall return the current variable value for the file or directory without changing *errno*. The value returned shall not be more restrictive than the corresponding value available to the application when it was compiled with the implementation's **<limits.h>** or **<unistd.h>**.

ERRORS

The *pathconf*( ) function shall fail if:

[EINVAL]	The value of *name* is not valid.
[ELOOP]	A loop exists in symbolic links encountered during resolution of the *path* argument.

The *pathconf*( ) function may fail if:

[EACCES]	Search permission is denied for a component of the path prefix.
[EINVAL]	The implementation does not support an association of the variable *name* with the specified file.
[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.
[ENAMETOOLONG]	The length of the *path* argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
[ENAMETOOLONG]	As a result of encountering a symbolic link in resolution of the *path* argument, the length of the substituted pathname string exceeded {PATH_MAX}.
[ENOENT]	A component of *path* does not name an existing file or *path* is an empty string.
[ENOTDIR]	A component of the path prefix is not a directory.

The *fpathconf*( ) function shall fail if:

[EINVAL]	The value of *name* is not valid.

The *fpathconf*( ) function may fail if:

[EBADF]	The *fildes* argument is not a valid file descriptor.
[EINVAL]	The implementation does not support an association of the variable *name* with the specified file.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *pathconf*( ) function was proposed immediately after the *sysconf*( ) function when it was realized that some configurable values may differ across file system, directory, or device boundaries.

For example, {NAME_MAX} frequently changes between System V and BSD-based file systems; System V uses a maximum of 14, BSD 255. On an implementation that provides both types of file systems, an application would be forced to limit all pathname components to 14 bytes, as this would be the value specified in **<limits.h>** on such a system.

Therefore, various useful values can be queried on any pathname or file descriptor, assuming that the appropriate permissions are in place.

The value returned for the variable {PATH_MAX} indicates the longest relative pathname that could be given if the specified directory is the process' current working directory. A process may not always be able to generate a name that long and use it if a subdirectory in the pathname crosses into a more restrictive file system.

The value returned for the variable _POSIX_CHOWN_RESTRICTED also applies to directories that do not have file systems mounted on them. The value may change when crossing a mount point, so applications that need to know should check for each directory. (An even easier check is to try the *chown*( ) function and look for an error in case it happens.)

Unlike the values returned by *sysconf*( ), the pathname-oriented variables are potentially more volatile and are not guaranteed to remain constant throughout the process' lifetime. For example, in between two calls to *pathconf*( ), the file system in question may have been unmounted and remounted with different characteristics.

Also note that most of the errors are optional. If one of the variables always has the same value on an implementation, the implementation need not look at *path* or *fildes* to return that value and is, therefore, not required to detect any of the errors except the meaning of [EINVAL] that indicates that the value of *name* is not valid for that variable.

If the value of any of the limits are unspecified (logically infinite), they will not be defined in **<limits.h>** and the *pathconf*( ) and *fpathconf*( ) functions return −1 without changing *errno*. This can be distinguished from the case of giving an unrecognized *name* argument because *errno* is set to [EINVAL] in this case.

Since −1 is a valid return value for the *pathconf*( ) and *fpathconf*( ) functions, applications should set *errno* to zero before calling them and check *errno* only if the return value is −1.

For the case of {SYMLINK_MAX}, since both *pathconf*( ) and *open*( ) follow symbolic links, there is no way that *path* or *fildes* could refer to a symbolic link.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3.

Entry included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to include {FILESIZEBITS}.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The _PC_SYMLINK_MAX entry is added to the table in the DESCRIPTION.

The *pathconf*( ) variables {POSIX_ALLOC_SIZE_MIN}, {POSIX_REC_INCR_XFER_SIZE}, {POSIX_REC_MAX_XFER_SIZE}, {POSIX_REC_MIN_XFER_SIZE}, {POSIX_REC_XFER_ALIGN} and their associated names are added for alignment with IEEE Std 1003.1d-1999.

fpclassify — classify real floating type

SYNOPSIS

```
#include <math.h>

int fpclassify(real-floating x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fpclassify*( ) macro shall classify its argument value as NaN, infinite, normal, subnormal, zero, or into another implementation-defined category. First, an argument represented in a format wider than its semantic type is converted to its semantic type. Then classification is based on the type of the argument.

RETURN VALUE

The *fpclassify*( ) macro shall return the value of the number classification macro appropriate to the value of its argument.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

NAME

fprintf, printf, snprintf, sprintf — print formatted output

SYNOPSIS

```
#include <stdio.h>

int fprintf(FILE *restrict stream, const char *restrict format, ...);
int printf(const char *restrict format, ...);
int snprintf(char *restrict s, size_t n,
    const char *restrict format, ...);
int sprintf(char *restrict s, const char *restrict format, ...);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fprintf*( ) function shall place output on the named output *stream*. The *printf*( ) function shall place output on the standard output stream *stdout*. The *sprintf*( ) function shall place output followed by the null byte, `'\0'`, in consecutive bytes starting at **s*; it is the user's responsibility to ensure that enough space is available.

The *snprintf*( ) function shall be equivalent to *sprintf*( ), with the addition of the *n* argument which states the size of the buffer referred to by *s*. If *n* is zero, nothing shall be written and *s* may be a null pointer. Otherwise, output bytes beyond the *n*-1st shall be discarded instead of being written to the array, and a null byte is written at the end of the bytes actually written into the array.

If copying takes place between objects that overlap as a result of a call to *sprintf*( ) or *snprintf*( ), the results are undefined.

Each of these functions converts, formats, and prints its arguments under control of the *format*. The *format* is a character string, beginning and ending in its initial shift state, if any. The *format* is composed of zero or more directives: *ordinary characters*, which are simply copied to the output stream, and *conversion specifications*, each of which shall result in the fetching of zero or more arguments. The results are undefined if there are insufficient arguments for the *format*. If the *format* is exhausted while arguments remain, the excess arguments shall be evaluated but are otherwise ignored.

XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than to the next unused argument. In this case, the conversion specifier character `%` (see below) is replaced by the sequence `"%n$"`, where *n* is a decimal integer in the range [1,{NL_ARGMAX}], giving the position of the argument in the argument list. This feature provides for the definition of format strings that select arguments in an order appropriate to specific languages (see the EXAMPLES section).

The *format* can contain either numbered argument conversion specifications (that is, `"%n$"` and `"*m$"`), or unnumbered argument conversion specifications (that is, `%` and `*`), but not both. The only exception to this is that `%%` can be mixed with the `"%n$"` form. The results of mixing numbered and unnumbered argument specifications in a *format* string are undefined. When numbered argument specifications are used, specifying the *N*th argument requires that all the leading arguments, from the first to the (*N*–*1*)th, are specified in the format string.

In format strings containing the `"%n$"` form of conversion specification, numbered arguments in the argument list can be referenced from the format string as many times as required.

In format strings containing the `%` form of conversion specification, each argument in the argument list is used exactly once.

CX All forms of the *fprintf*( ) functions allow for the insertion of a language-dependent radix character in the output string. The radix character is defined in the program's locale (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a period (`'.'`).

XSI Each conversion specification is introduced by the `'%'` character or by the character sequence `"%n$"`, after which the following appear in sequence:

- Zero or more *flags* (in any order), which modify the meaning of the conversion specification.
- An optional minimum *field width*. If the converted value has fewer bytes than the field width, it shall be padded with spaces by default on the left; it shall be padded on the right if the left-adjustment flag (`'−'`), described below, is given to the field width. The field width takes the form of an asterisk (`'*'`), described below, or a decimal integer.
- An optional *precision* that gives the minimum number of digits to appear for the `d`, `i`, `o`, `u`, `x`, and `X` conversion specifiers; the number of digits to appear after the radix character for the `a`, `A`, `e`, `E`, `f`, and `F` conversion specifiers; the maximum number of significant digits for the `g` and `G` conversion specifiers; or the maximum number of bytes to be printed from a string in `s` XSI and `S` conversion specifiers. The precision takes the form of a period (`'.'`) followed either by an asterisk (`'*'`), described below, or an optional decimal digit string, where a null digit string is treated as zero. If a precision appears with any other conversion specifier, the behavior is undefined.
- An optional length modifier that specifies the size of the argument.
- A *conversion specifier* character that indicates the type of conversion to be applied.

A field width, or precision, or both, may be indicated by an asterisk (`'*'`). In this case an argument of type **int** supplies the field width or precision. Applications shall ensure that arguments specifying field width, or precision, or both appear in that order before the argument, if any, to be converted. A negative field width is taken as a `'−'` flag followed by a positive field XSI width. A negative precision is taken as if the precision were omitted. In format strings containing the `"%n$"` form of a conversion specification, a field width or precision may be indicated by the sequence `"*m$"`, where *m* is a decimal integer in the range [1,{NL_ARGMAX}] giving the position in the argument list (after the format argument) of an integer argument containing the field width or precision, for example:

```
printf("%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```

The flag characters and their meanings are:

XSI `'`	The integer portion of the result of a decimal conversion (`%i`, `%d`, `%u`, `%f`, `%F`, `%g`, or `%G`) shall be formatted with thousands' grouping characters. For other conversions the behavior is undefined. The non-monetary grouping character is used.
−	The result of the conversion shall be left-justified within the field. The conversion is right-justified if this flag is not specified.
+	The result of a signed conversion shall always begin with a sign (`'+'` or `'−'`). The conversion shall begin with a sign only when a negative value is converted if this flag is not specified.
<space>	If the first character of a signed conversion is not a sign or if a signed conversion results in no characters, a <space> shall be prefixed to the result. This means that if the <space> and `'+'` flags both appear, the <space> flag shall be ignored.
#	Specifies that the value is to be converted to an alternative form. For `o` conversion, it increases the precision (if necessary) to force the first digit of the result to be zero. For `x`

or `X` conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For `a`, `A`, `e`, `E`, `f`, `F`, `g`, and `G` conversion specifiers, the result shall always contain a radix character, even if no digits follow the radix character. Without this flag, a radix character appears in the result of these conversions only if a digit follows it. For `g` and `G` conversion specifiers, trailing zeros shall *not* be removed from the result as they normally are. For other conversion specifiers, the behavior is undefined.

`0` For `d`, `i`, `o`, `u`, `x`, `X`, `a`, `A`, `e`, `E`, `f`, `F`, `g`, and `G` conversion specifiers, leading zeros (following any indication of sign or base) are used to pad to the field width; no space padding is performed. If the `'0'` and `'−'` flags both appear, the `'0'` flag is ignored. For `d`, `i`, `o`, `u`, `x`, and `X` conversion specifiers, if a precision is specified, the `'0'` flag is ignored. XSI If the `'0'` and `'\''` flags both appear, the grouping characters are inserted before zero padding. For other conversions, the behavior is undefined.

The length modifiers and their meanings are:

`hh` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **signed char** or **unsigned char** argument (the argument will have been promoted according to the integer promotions, but its value shall be converted to **signed char** or **unsigned char** before printing); or that a following `n` conversion specifier applies to a pointer to a **signed char** argument.

`h` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **short** or **unsigned short** argument (the argument will have been promoted according to the integer promotions, but its value shall be converted to **short** or **unsigned short** before printing); or that a following `n` conversion specifier applies to a pointer to a **short** argument.

`l` (ell) Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **long** or **unsigned long** argument; that a following `n` conversion specifier applies to a pointer to a **long** argument; that a following `c` conversion specifier applies to a **wint_t** argument; that a following `s` conversion specifier applies to a pointer to a **wchar_t** argument; or has no effect on a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier.

`ll` (ell-ell)
Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **long long** or **unsigned long long** argument; or that a following `n` conversion specifier applies to a pointer to a **long long** argument.

`j` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to an **intmax_t** or **uintmax_t** argument; or that a following `n` conversion specifier applies to a pointer to an **intmax_t** argument.

`z` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **size_t** or the corresponding signed integer type argument; or that a following `n` conversion specifier applies to a pointer to a signed integer type corresponding to **size_t** argument.

`t` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **ptrdiff_t** or the corresponding **unsigned** type argument; or that a following `n` conversion specifier applies to a pointer to a **ptrdiff_t** argument.

`L` Specifies that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier applies to a **long double** argument.

If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.

The conversion specifiers and their meanings are:

`d`, `i`	The **int** argument shall be converted to a signed decimal in the style `"[−]dddd"`. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision is 1. The result of converting zero with an explicit precision of zero shall be no characters.
`o`	The **unsigned** argument shall be converted to unsigned octal format in the style `"dddd"`. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision is 1. The result of converting zero with an explicit precision of zero shall be no characters.
`u`	The **unsigned** argument shall be converted to unsigned decimal format in the style `"dddd"`. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision is 1. The result of converting zero with an explicit precision of zero shall be no characters.
`x`	The **unsigned** argument shall be converted to unsigned hexadecimal format in the style `"dddd"`; the letters `"abcdef"` are used. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision is 1. The result of converting zero with an explicit precision of zero shall be no characters.
`X`	Equivalent to the `x` conversion specifier, except that letters `"ABCDEF"` are used instead of `"abcdef"`.
`f`, `F`	The **double** argument shall be converted to decimal notation in the style `"[−]ddd.ddd"`, where the number of digits after the radix character is equal to the precision specification. If the precision is missing, it shall be taken as 6; if the precision is explicitly zero and no `'#'` flag is present, no radix character shall appear. If a radix character appears, at least one digit appears before it. The low-order digit shall be rounded in an implementation-defined manner. A **double** argument representing an infinity shall be converted in one of the styles `"[−]inf"` or `"[−]infinity"`; which style is implementation-defined. A **double** argument representing a NaN shall be converted in one of the styles `"[−]nan(n-char-sequence)"`; or `"[−]nan"` which style, and the meaning of any *n-char-sequence*, is implementation-defined. The `F` conversion specifier produces `"INF"`, `"INFINITY"`, or `"NAN"` instead of `"inf"`, `"infinity"`, or `"nan"`, respectively.
`e`, `E`	The **double** argument shall be converted in the style `"[−]d.ddde±dd"`, where there is one digit before the radix character (which is non-zero if the argument is non-zero) and the number of digits after it is equal to the precision; if the precision is missing, it shall be taken as 6; if the precision is zero and no `'#'` flag is present, no radix character shall appear. The low-order digit shall be rounded in an implementation-defined manner. The `E` conversion specifier shall produce a number with `'E'` instead of `'e'` introducing the exponent. The exponent shall always contain at least two digits. If the value is zero, the exponent shall be zero. A **double** argument representing an infinity or NaN shall be converted in the style of an `f` or `F` conversion specifier.
`g`, `G`	The **double** argument shall be converted in the style `f` or `e` (or in the style `E` in the case of a `G` conversion specifier), with the precision specifying the number of significant

digits. If an explicit precision is zero, it shall be taken as 1. The style used depends on the value converted; style `e` (or `E`) shall be used only if the exponent resulting from such a conversion is less than −4 or greater than or equal to the precision. Trailing zeros shall be removed from the fractional portion of the result; a radix character shall appear only if it is followed by a digit.

A **double** argument representing an infinity or NaN shall be converted in the style of an `f` or `F` conversion specifier.

`a`, `A` A **double** argument representing a floating-point number shall be converted in the style `"[−]0x`*h.hhhh*`p±`*d*`"`, where there is one hexadecimal digit (which shall be non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point character and the number of hexadecimal digits after it is equal to the precision; if the precision is missing and FLT_RADIX is a power of 2, then the precision shall be sufficient for an exact representation of the value; if the precision is missing and FLT_RADIX is not a power of 2, then the precision shall be sufficient to distinguish values of type **double**, except that trailing zeros may be omitted; if the precision is zero and the `'#'` flag is not specified, no decimal-point character shall appear. The letters `"abcdef"` shall be used for `a` conversion and the letters `"ABCDEF"` for `A` conversion. The `A` conversion specifier produces a number with `'X'` and `'P'` instead of `'x'` and `'p'`. The exponent shall always contain at least one digit, and only as many more digits as necessary to represent the decimal exponent of 2. If the value is zero, the exponent shall be zero.

A **double** argument representing an infinity or NaN shall be converted in the style of an `f` or `F` conversion specifier.

`c` The **int** argument shall be converted to an **unsigned char**, and the resulting byte shall be written.

If an `l` (ell) qualifier is present, the **wint_t** argument shall be converted as if by an `ls` conversion specification with no precision and an argument that points to a two-element array of type **wchar_t**, the first element of which contains the **wint_t** argument to the `ls` conversion specification and the second element contains a null wide character.

`s` The argument shall be a pointer to an array of **char**. Bytes from the array shall be written up to (but not including) any terminating null byte. If the precision is specified, no more than that many bytes shall be written. If the precision is not specified or is greater than the size of the array, the application shall ensure that the array contains a null byte.

If an `l` (ell) qualifier is present, the argument shall be a pointer to an array of type **wchar_t**. Wide characters from the array shall be converted to characters (each as if by a call to the *wcrtomb*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first wide character is converted) up to and including a terminating null wide character. The resulting characters shall be written up to (but not including) the terminating null character (byte). If no precision is specified, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many characters (bytes) shall be written (including shift sequences, if any), and the array shall contain a null wide character if, to equal the character sequence length given by the precision, the function would need to access a wide character one past the end of the array. In no case shall a partial character written.

	`p`	The argument shall be a pointer to **void**. The value of the pointer is converted to a sequence of printable characters, in an implementation-defined manner.
	`n`	The argument shall be a pointer to an integer into which is written the number of bytes written to the output so far by this call to one of the *fprintf*( ) functions. No argument is converted.
XSI	`C`	Equivalent to `lc`.
XSI	`S`	Equivalent to `ls`.
	`%`	Print a `'%'` character; no argument is converted. The complete conversion specification shall be `%%`.

If a conversion specification does not match one of the above forms, the behavior is undefined. If any argument is not the correct type for the corresponding conversion specification, the behavior is undefined.

In no case shall a nonexistent or small field width cause truncation of a field; if the result of a conversion is wider than the field width, the field shall be expanded to contain the conversion result. Characters generated by *fprintf*( ) and *printf*( ) are printed as if *fputc*( ) had been called.

For the `a` and `A` conversion specifiers, if FLT_RADIX is a power of 2, the value shall be correctly rounded to a hexadecimal floating number with the given precision.

For `a` and `A` conversions, if FLT_RADIX is not a power of 2 and the result is not exactly representable in the given precision, the result should be one of the two adjacent numbers in hexadecimal floating style with the given precision, with the extra stipulation that the error should have a correct sign for the current rounding direction.

For the `e`, `E`, `f`, `F`, `g`, and `G` conversion specifiers, if the number of significant decimal digits is at most DECIMAL_DIG, then the result should be correctly rounded. If the number of significant decimal digits is more than DECIMAL_DIG but the source value is exactly representable with DECIMAL_DIG digits, then the result should be an exact representation with trailing zeros. Otherwise, the source value is bounded by two adjacent decimal strings $L < U$, both having DECIMAL_DIG significant digits; the value of the resultant decimal string D should satisfy $L <= D <= U$, with the extra stipulation that the error should have a correct sign for the current rounding direction.

CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the call to a successful execution of *fprintf*( ) or *printf*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream or a call to *exit*( ) or *abort*( ).

RETURN VALUE

Upon successful completion, the *fprintf*( ) and *printf*( ) functions shall return the number of bytes transmitted.

Upon successful completion, the *sprintf*( ) function shall return the number of bytes written to *s*, excluding the terminating null byte.

Upon successful completion, the *snprintf*( ) function shall return the number of bytes that would be written to *s* had *n* been sufficiently large excluding the terminating null byte.

If an output error was encountered, these functions shall return a negative value.

If the value of *n* is zero on a call to *snprintf*( ), nothing shall be written, the number of bytes that would have been written had *n* been sufficiently large excluding the terminating null shall be returned, and *s* may be a null pointer.

ERRORS

For the conditions under which *fprintf*( ) and *printf*( ) fail and may fail, refer to *fputc*( ) or *fputwc*( ).

In addition, all forms of *fprintf*( ) may fail if:

XSI [EILSEQ] A wide-character code that does not correspond to a valid character has been detected.

XSI [EINVAL] There are insufficient arguments.

The *printf*( ) and *fprintf*( ) functions may fail if:

XSI [ENOMEM] Insufficient storage space is available.

The *snprintf*( ) function shall fail if:

XSI [EOVERFLOW] The value of *n* is greater than {INT_MAX} or the number of bytes needed to hold the output excluding the terminating null is greater than {INT_MAX}.

EXAMPLES

Printing Language-Independent Date and Time

The following statement can be used to print date and time using a language-independent format:

```
printf(format, weekday, month, day, hour, min);
```

For American usage, *format* could be a pointer to the following string:

```
"%s, %s %d, %d:%.2d\n"
```

This example would produce the following message:

```
Sunday, July 3, 10:02
```

For German usage, *format* could be a pointer to the following string:

```
"%1$s, %3$d. %2$s, %4$d:%5$.2d\n"
```

This definition of *format* would produce the following message:

```
Sonntag, 3. Juli, 10:02
```

Printing File Information

The following example prints information about the type, permissions, and number of links of a specific file in a directory.

The first two calls to *printf*( ) use data decoded from a previous *stat*( ) call. The user-defined *strperm*( ) function shall return a string similar to the one at the beginning of the output for the following command:

```
ls −l
```

The next call to *printf*( ) outputs the owner's name if it is found using *getpwuid*( ); the *getpwuid*( ) function shall return a **passwd** structure from which the name of the user is extracted. If the user name is not found, the program instead prints out the numeric value of the user ID.

The next call prints out the group name if it is found using *getgrgid*( ); *getgrgid*( ) is very similar to *getpwuid*( ) except that it shall return group information based on the group number. Once again, if the group is not found, the program prints the numeric value of the group for the entry.

The final call to *printf*( ) prints the size of the file.

```
#include <stdio.h>
#include <sys/types.h>
#include <pwd.h>
#include <grp.h>

char *strperm (mode_t);
...
struct stat statbuf;
struct passwd *pwd;
struct group *grp;
...
printf("%10.10s", strperm (statbuf.st_mode));
printf("%4d", statbuf.st_nlink);

if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
    printf(" %-8.8s", pwd->pw_name);
else
    printf(" %-8ld", (long) statbuf.st_uid);

if ((grp = getgrgid(statbuf.st_gid)) != NULL)
    printf(" %-8.8s", grp->gr_name);
else
    printf(" %-8ld", (long) statbuf.st_gid);

printf("%9jd", (intmax_t) statbuf.st_size);
...
```

Printing a Localized Date String

The following example gets a localized date string. The *nl_langinfo*( ) function shall return the localized date string, which specifies the order and layout of the date. The *strftime*( ) function takes this information and, using the **tm** structure for values, places the date and time information into *datestring*. The *printf*( ) function then outputs *datestring* and the name of the entry.

```
#include <stdio.h>
#include <time.h>
#include <langinfo.h>
...
struct dirent *dp;
struct tm *tm;
char datestring[256];
...
strftime(datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);

printf(" %s %s\n", datestring, dp->d_name);
...
```

Printing Error Information

The following example uses *fprintf*( ) to write error information to standard error.

In the first group of calls, the program tries to open the password lock file named **LOCKFILE**. If the file already exists, this is an error, as indicated by the O_EXCL flag on the *open*( ) function. If the call fails, the program assumes that someone else is updating the password file, and the program exits.

The next group of calls saves a new password file as the current password file by creating a link between **LOCKFILE** and the new password file **PASSWDFILE**.

```
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <string.h>
#include <errno.h>

#define LOCKFILE "/etc/ptmp"
#define PASSWDFILE "/etc/passwd"
...
int pfd;
...
if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
    S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == −1)
{
    fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
    exit(1);
}
...
if (link(LOCKFILE,PASSWDFILE) == -1) {
    fprintf(stderr, "Link error: %s\n", strerror(errno));
    exit(1);
}
...
```

Printing Usage Information

The following example checks to make sure the program has the necessary arguments, and uses *fprintf*( ) to print usage information if the expected number of arguments is not present.

```
#include <stdio.h>
#include <stdlib.h>
...
char *Options = "hdbtl";
...
if (argc < 2) {
    fprintf(stderr, "Usage: %s -%s <file\n", argv[0], Options); exit(1);
}
...
```

Formatting a Decimal String

The following example prints a key and data pair on *stdout*. Note use of the `'*'` (asterisk) in the format string; this ensures the correct number of decimal places for the element based on the number of elements requested.

```
#include <stdio.h>
...
long i;
char *keystr;
int elementlen, len;
...
while (len < elementlen) {
...
    printf("%s Element%0*ld\n", keystr, elementlen, i);
...
}
```

Creating a Filename

The following example creates a filename using information from a previous *getpwnam*( ) function that returned the HOME directory of the user.

```
#include <stdio.h>
#include <sys/types.h>
#include <unistd.h>
...
char filename[PATH_MAX+1];
struct passwd *pw;
...
sprintf(filename, "%s/%d.out", pw->pw_dir, getpid());
...
```

Reporting an Event

The following example loops until an event has timed out. The *pause*( ) function waits forever unless it receives a signal. The *fprintf*( ) statement should never occur due to the possible return values of *pause*( ).

```
#include <stdio.h>
#include <unistd.h>
#include <string.h>
#include <errno.h>
...
while (!event_complete) {
...
    if (pause() != −1 || errno != EINTR)
        fprintf(stderr, "pause: unknown error: %s\n", strerror(errno));
}
...
```

Printing Monetary Information

The following example uses *strfmon*( ) to convert a number and store it as a formatted monetary string named *convbuf*. If the first number is printed, the program prints the format and the description; otherwise, it just prints the number.

```
#include <monetary.h>
#include <stdio.h>
...
struct tblfmt {
    char *format;
    char *description;
};

struct tblfmt table[] = {
    { "%n", "default formatting" },
    { "%11n", "right align within an 11 character field" },
    { "%#5n", "aligned columns for values up to 99,999" },
    { "%=*#5n", "specify a fill character" },
    { "%=0#5n", "fill characters do not use grouping" },
    { "%^#5n", "disable the grouping separator" },
    { "%^#5.0n", "round off to whole units" },
    { "%^#5.4n", "increase the precision" },
    { "%(#5n", "use an alternative pos/neg style" },
    { "%!(#5n", "disable the currency symbol" },
};
...
float input[3];
int i, j;
char convbuf[100];
...
strfmon(convbuf, sizeof(convbuf), table[i].format, input[j]);

if (j == 0) {
    printf("%s%s%s\n", table[i].format,
        convbuf, table[i].description);
}
else {
    printf("%s\n", convbuf);
}
...
```

APPLICATION USAGE

If the application calling *fprintf*( ) has any objects of type **wint_t** or **wchar_t**, it must also include the **<wchar.h>** header to have these objects defined.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the `l` (ell) qualifier can now be used with `c` and `s` conversion specifiers.

The *snprintf*( ) function is new in Issue 5.

Issue 6

Extensions beyond the ISO C standard are now marked.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototypes for *fprintf*( ), *printf*( ), *snprintf*( ), and *sprintf*( ) are updated, and the XSI shading is removed from *snprintf*( ).
- The description of *snprintf*( ) is aligned with the ISO C standard. Note that this supersedes the *snprintf*( ) description in The Open Group Base Resolution bwg98-006, which changed the behavior from Issue 5.
- The DESCRIPTION is updated.

The DESCRIPTION is updated to use the terms ‘‘conversion specifier’’ and ‘‘conversion specification’’ consistently.

ISO/IEC 9899:1999 standard, Technical Corrigendum No. 1 is incorporated.

NAME

fputc — put a byte on a stream

SYNOPSIS

```
#include <stdio.h>

int fputc(int c, FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fputc*( ) function shall write the byte specified by *c* (converted to an **unsigned char**) to the output stream pointed to by *stream*, at the position indicated by the associated file-position indicator for the stream (if defined), and shall advance the indicator appropriately. If the file cannot support positioning requests, or if the stream was opened with append mode, the byte shall be appended to the output stream.

CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful execution of *fputc*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream or a call to *exit*( ) or *abort*( ).

RETURN VALUE

Upon successful completion, *fputc*( ) shall return the value it has written. Otherwise, it shall return EOF, the error indicator for the stream shall be set, CX and *errno* shall be set to indicate the error.

ERRORS

The *fputc*( ) function shall fail if either the *stream* is unbuffered or the *stream*'s buffer needs to be flushed, and:

CX	[EAGAIN]	The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the process would be delayed in the write operation.
CX	[EBADF]	The file descriptor underlying *stream* is not a valid file descriptor open for writing.
CX	[EFBIG]	An attempt was made to write to a file that exceeds the maximum file size.
XSI	[EFBIG]	An attempt was made to write to a file that exceeds the process' file size limit.
CX	[EFBIG]	The file is a regular file and an attempt was made to write at or beyond the offset maximum.
CX	[EINTR]	The write operation was terminated due to the receipt of a signal, and no data was transferred.
CX	[EIO]	A physical I/O error has occurred, or the process is a member of a background process group attempting to write to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.
CX	[ENOSPC]	There was no free space remaining on the device containing the file.
CX	[EPIPE]	An attempt is made to write to a pipe or FIFO that is not open for reading by any process. A SIGPIPE signal shall also be sent to the thread.

The *fputc*( ) function may fail if:

CX [ENOMEM] Insufficient storage space is available.

CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] and [EFBIG] mandatory error conditions are added.
- The [ENOMEM] and [ENXIO] optional error conditions are added.

NAME

fputs — put a string on a stream

SYNOPSIS

```
#include <stdio.h>

int fputs(const char *restrict s, FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fputs*( ) function shall write the null-terminated string pointed to by *s* to the stream pointed to by *stream*. The terminating null byte shall not be written.

CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful execution of *fputs*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream or a call to *exit*( ) or *abort*( ).

RETURN VALUE

Upon successful completion, *fputs*( ) shall return a non-negative number. Otherwise, it shall return EOF, set an error indicator for the stream, CX and set *errno* to indicate the error.

ERRORS

Refer to *fputc*( ).

EXAMPLES

Printing to Standard Output

The following example gets the current time, converts it to a string using *localtime*( ) and *asctime*( ), and prints it to standard output using *fputs*( ). It then prints the number of minutes to an event for which it is waiting.

```
#include <time.h>
#include <stdio.h>
...
time_t now;
int minutes_to_event;
...
time(&now);
printf("The time is ");
fputs(asctime(localtime(&now)), stdout);
printf("There are still %d minutes to the event.\n",
    minutes_to_event);
...
```

APPLICATION USAGE

The *puts*( ) function appends a <newline> while *fputs*( ) does not.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 6

Extensions beyond the ISO C standard are now marked.

The *fputs*( ) prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

NAME

fputwc — put a wide-character code on a stream

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

wint_t fputwc(wchar_t wc, FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fputwc*( ) function shall write the character corresponding to the wide-character code *wc* to the output stream pointed to by *stream*, at the position indicated by the associated file-position indicator for the stream (if defined), and advances the indicator appropriately. If the file cannot support positioning requests, or if the stream was opened with append mode, the character is appended to the output stream. If an error occurs while writing the character, the shift state of the output file is left in an undefined state.

CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful execution of *fputwc*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream or a call to *exit*( ) or *abort*( ).

RETURN VALUE

Upon successful completion, *fputwc*( ) shall return *wc*. Otherwise, it shall return WEOF, the error indicator for the stream shall be set set, CX and *errno* shall be set to indicate the error.

ERRORS

The *fputwc*( ) function shall fail if either the stream is unbuffered or data in the *stream*'s buffer needs to be written, and:

CX	[EAGAIN]	The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the process would be delayed in the write operation.
CX	[EBADF]	The file descriptor underlying *stream* is not a valid file descriptor open for writing.
CX	[EFBIG]	An attempt was made to write to a file that exceeds the maximum file size or the process' file size limit.
CX	[EFBIG]	The file is a regular file and an attempt was made to write at or beyond the offset maximum associated with the corresponding stream.
	[EILSEQ]	The wide-character code *wc* does not correspond to a valid character.
CX	[EINTR]	The write operation was terminated due to the receipt of a signal, and no data was transferred.
CX	[EIO]	A physical I/O error has occurred, or the process is a member of a background process group attempting to write to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.
CX	[ENOSPC]	There was no free space remaining on the device containing the file.
CX	[EPIPE]	An attempt is made to write to a pipe or FIFO that is not open for reading by any process. A SIGPIPE signal shall also be sent to the thread.

The *fputwc*( ) function may fail if:

CX [ENOMEM] Insufficient storage space is available.

CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.

CHANGE HISTORY

First released in Issue 4. Derived from the MSE working draft.

Issue 5

Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc* is changed from **wint_t** to **wchar_t**.

The Optional Header (OH) marking is removed from **<stdio.h>**.

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EFBIG] and [EIO] mandatory error conditions are added.
- The [ENOMEM] and [ENXIO] optional error conditions are addd.

NAME

fputws — put a wide-character string on a stream

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

int fputws(const wchar_t *restrict ws, FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fputws*( ) function shall write a character string corresponding to the (null-terminated) wide-character string pointed to by *ws* to the stream pointed to by *stream*. No character corresponding to the terminating null wide-character code shall be written.

CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful execution of *fputws*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream or a call to *exit*( ) or *abort*( ).

RETURN VALUE

Upon successful completion, *fputws*( ) shall return a non-negative number. Otherwise, it shall CX return −1, set an error indicator for the stream, and set *errno* to indicate the error.

ERRORS

Refer to *fputwc*( ).

EXAMPLES

None.

APPLICATION USAGE

The *fputws*( ) function does not append a <newline>.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

fopen( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**, **<wchar.h>**

CHANGE HISTORY

First released in Issue 4. Derived from the MSE working draft.

Issue 5

The Optional Header (OH) marking is removed from **<stdio.h>**.

Issue 6

Extensions beyond the ISO C standard are now marked.

The *fputws*( ) prototype is updated for alignment with the ISO / IEC 9899: 1999 standard.

NAME

fread — binary input

SYNOPSIS

```
#include <stdio.h>

size_t fread(void *restrict ptr, size_t size, size_t nitems,
    FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fread*( ) function shall read into the array pointed to by *ptr* up to *nitems* elements whose size is specified by *size* in bytes, from the stream pointed to by *stream*. For each object, *size* calls shall be made to the *fgetc*( ) function and the results stored, in the order read, in an array of **unsigned char** exactly overlaying the object. The file position indicator for the stream (if defined) shall be advanced by the number of bytes successfully read. If an error occurs, the resulting value of the file position indicator for the stream is unspecified. If a partial element is read, its value is unspecified.

CX The *fread*( ) function may mark the *st_atime* field of the file associated with *stream* for update. The *st_atime* field shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ), *fgetwc*( ), *fgetws*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *gets*( ), or *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ) or *ungetwc*( ).

RETURN VALUE

Upon successful completion, *fread*( ) shall return the number of elements successfully read which is less than *nitems* only if a read error or end-of-file is encountered. If *size* or *nitems* is 0, *fread*( ) shall return 0 and the contents of the array and the state of the stream remain unchanged. CX Otherwise, if a read error occurs, the error indicator for the stream shall be set, and *errno* shall be set to indicate the error.

ERRORS

Refer to *fgetc*( ).

EXAMPLES

Reading from a Stream

The following example reads a single element from the *fp* stream into the array pointed to by *buf*.

```
#include <stdio.h>
...
size_t bytes_read;
char buf[100];
FILE *fp;
...
bytes_read = fread(buf, sizeof(buf), 1, fp);
...
```

APPLICATION USAGE

The *ferror*( ) or *feof*( ) functions must be used to distinguish between an error condition and an end-of-file condition.

Because of possible differences in element length and byte ordering, files written using *fwrite*( ) are application-dependent, and possibly cannot be read using *fread*( ) by a different application or by the same application on a different processor.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

feof( ), *ferror*( ), *fgetc*( ), *fopen*( ), *getc*( ), *gets*( ), *scanf*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The *fread*( ) prototype is updated.
- The DESCRIPTION is updated to describe how the bytes from a call to *fgetc*( ) are stored.

NAME

free — free allocated memory

SYNOPSIS

```
#include <stdlib.h>

void free(void *ptr);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *free*( ) function shall cause the space pointed to by *ptr* to be deallocated; that is, made available for further allocation. If *ptr* is a null pointer, no action shall occur. Otherwise, if the ADV argument does not match a pointer earlier returned by the *calloc*( ), *malloc*( ), *posix_memalign*( ), XSI *realloc*( ), or *strdup*( ), function, or if the space has been deallocated by a call to *free*( ) or *realloc*( ), the behavior is undefined.

Any use of a pointer that refers to freed space results in undefined behavior.

RETURN VALUE

The *free*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

There is now no requirement for the implementation to support the inclusion of **<malloc.h>**.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

calloc( ), *malloc*( ), *realloc*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdlib.h>**

CHANGE HISTORY

Issue 6

Reference to the *valloc*( ) function is removed.

NAME

freeaddrinfo, getaddrinfo — get address information

SYNOPSIS

```
#include <sys/socket.h>
#include <netdb.h>

void freeaddrinfo(struct addrinfo *ai);
int getaddrinfo(const char *restrict nodename,
    const char *restrict servname,
    const struct addrinfo *restrict hints,
    struct addrinfo **restrict res);
```

DESCRIPTION

The *freeaddrinfo*( ) function shall free one or more **addrinfo** structures returned by *getaddrinfo*( ), along with any additional storage associated with those structures. If the *ai_next* field of the structure is not null, the entire list of structures shall be freed. The *freeaddrinfo*( ) function shall support the freeing of arbitrary sublists of an **addrinfo** list originally returned by *getaddrinfo*( ).

The *getaddrinfo*( ) function shall translate the name of a service location (for example, a host name) and/or a service name and shall return a set of socket addresses and associated information to be used in creating a socket with which to address the specified service.

The *freeaddrinfo*( ) and *getaddrinfo*( ) functions shall be thread-safe.

The *nodename* and *servname* arguments are either null pointers or pointers to null-terminated strings. One or both of these two arguments shall be supplied by the application as a non-null pointer.

The format of a valid name depends on the address family or families. If a specific family is not given and the name could be interpreted as valid within multiple supported families, the implementation shall attempt to resolve the name in all supported families and, in absence of errors, one or more results shall be returned.

If the *nodename* argument is not null, it can be a descriptive name or can be an address string. If the specified address family is AF_INET, AF_INET6, or AF_UNSPEC, valid descriptive names include host names. If the specified address family is AF_INET or AF_UNSPEC, address strings using Internet standard dot notation as specified in *inet_addr*( ) are valid.

If the specified address family is AF_INET6 or AF_UNSPEC, standard IPv6 text forms described in *inet_ntop*( ) are valid.

If *nodename* is not null, the requested service location is named by *nodename*; otherwise, the requested service location is local to the caller.

If *servname* is null, the call shall return network-level addresses for the specified *nodename*. If *servname* is not null, it is a null-terminated character string identifying the requested service. This can be either a descriptive name or a numeric representation suitable for use with the address family or families. If the specified address family is AF_INET, AF_INET6, or AF_UNSPEC, the service can be specified as a string specifying a decimal port number.

If the *hints* argument is not null, it refers to a structure containing input values that may direct the operation by providing options and by limiting the returned information to a specific socket type, address family and/or protocol. In this *hints* structure every member other than *ai_flags*, *ai_family*, *ai_socktype*, and *ai_protocol* shall be set to zero or a null pointer. A value of AF_UNSPEC for *ai_family* means that the caller shall accept any address family. A value of zero for *ai_socktype* means that the caller shall accept any socket type. A value of zero for *ai_protocol* means that the caller shall accept any protocol. If *hints* is a null pointer, the behavior shall be as if it referred to a structure containing the value zero for the *ai_flags*, *ai_socktype*, and *ai_protocol* fields, and AF_UNSPEC for the *ai_family* field.

The *ai_flags* field to which the *hints* parameter points shall be set to zero or be the bitwise-inclusive OR of one or more of the values AI_PASSIVE, AI_CANONNAME, AI_NUMERICHOST, and AI_NUMERICSERV.

If the AI_PASSIVE flag is specified, the returned address information shall be suitable for use in binding a socket for accepting incoming connections for the specified service. In this case, if the *nodename* argument is null, then the IP address portion of the socket address structure shall be set to INADDR_ANY for an IPv4 address or IN6ADDR_ANY_INIT for an IPv6 address. If the AI_PASSIVE flag is not specified, the returned address information shall be suitable for a call to *connect*( ) (for a connection-mode protocol) or for a call to *connect*( ), *sendto*( ), or *sendmsg*( ) (for a connectionless protocol). In this case, if the *nodename* argument is null, then the IP address portion of the socket address structure shall be set to the loopback address.

If the AI_CANONNAME flag is specified and the *nodename* argument is not null, the function shall attempt to determine the canonical name corresponding to *nodename* (for example, if *nodename* is an alias or shorthand notation for a complete name).

If the AI_NUMERICHOST flag is specified, then a non-null *nodename* string supplied shall be a numeric host address string. Otherwise, an [EAI_NONAME] error is returned. This flag shall prevent any type of name resolution service (for example, the DNS) from being invoked.

If the AI_NUMERICSERV flag is specified, then a non-null *servname* string supplied shall be a numeric port string. Otherwise, an [EAI_NONAME] error shall be returned. This flag shall prevent any type of name resolution service (for example, NIS+) from being invoked.

IP6 If the AI_V4MAPPED flag is specified along with an *ai_family* of AF_INET6, then *getaddrinfo*( ) shall return IPv4-mapped IPv6 addresses on finding no matching IPv6 addresses (*ai_addrlen* shall be 16). The AI_V4MAPPED flag shall be ignored unless *ai_family* equals AF_INET6. If the AI_ALL flag is used with the AI_V4MAPPED flag, then *getaddrinfo*( ) shall return all matching IPv6 and IPv4 addresses. The AI_ALL flag without the AI_V4MAPPED flag is ignored.

The *ai_socktype* field to which argument *hints* points specifies the socket type for the service, as defined in *socket*( ). If a specific socket type is not given (for example, a value of zero) and the service name could be interpreted as valid with multiple supported socket types, the implementation shall attempt to resolve the service name for all supported socket types and, in the absence of errors, all possible results shall be returned. A non-zero socket type value shall limit the returned information to values with the specified socket type.

If the *ai_family* field to which *hints* points has the value AF_UNSPEC, addresses shall be returned for use with any address family that can be used with the specified *nodename* and/or *servname*. Otherwise, addresses shall be returned for use only with the specified address family. If *ai_family* is not AF_UNSPEC and *ai_protocol* is not zero, then addresses are returned for use only with the specified address family and protocol; the value of *ai_protocol* shall be interpreted as in a call to the *socket*( ) function with the corresponding values of *ai_family* and *ai_protocol*.

RETURN VALUE

A zero return value for *getaddrinfo*( ) indicates successful completion; a non-zero return value indicates failure. The possible values for the failures are listed in the ERRORS section.

Upon successful return of *getaddrinfo*( ), the location to which *res* points shall refer to a linked list of **addrinfo** structures, each of which shall specify a socket address and information for use in creating a socket with which to use that socket address. The list shall include at least one **addrinfo** structure. The *ai_next* field of each structure contains a pointer to the next structure on the list, or a null pointer if it is the last structure on the list. Each structure on the list shall include values for use with a call to the *socket*( ) function, and a socket address for use with the *connect*( ) function or, if the AI_PASSIVE flag was specified, for use with the *bind*( ) function. The fields *ai_family*, *ai_socktype*, and *ai_protocol* shall be usable as the arguments to the *socket*( ) function to create a socket suitable for use with the returned address. The fields *ai_addr* and *ai_addrlen* are usable as the arguments to the *connect*( ) or *bind*( ) functions with such a socket, according to the AI_PASSIVE flag.

If *nodename* is not null, and if requested by the AI_CANONNAME flag, the *ai_canonname* field of the first returned **addrinfo** structure shall point to a null-terminated string containing the canonical name corresponding to the input *nodename*; if the canonical name is not available, then *ai_canonname* shall refer to the *nodename* argument or a string with the same contents. The contents of the *ai_flags* field of the returned structures are undefined.

All fields in socket address structures returned by *getaddrinfo*( ) that are not filled in through an explicit argument (for example, *sin6_flowinfo*) shall be set to zero.

Note: This makes it easier to compare socket address structures.

ERRORS

The *getaddrinfo*( ) function shall fail and return the corresponding value if:

[EAI_AGAIN]	The name could not be resolved at this time. Future attempts may succeed.
[EAI_BADFLAGS]	The *flags* parameter had an invalid value.
[EAI_FAIL]	A non-recoverable error occurred when attempting to resolve the name.
[EAI_FAMILY]	The address family was not recognized.
[EAI_MEMORY]	There was a memory allocation failure when trying to allocate storage for the return value.
[EAI_NONAME]	The name does not resolve for the supplied parameters. Neither *nodename* nor *servname* were supplied. At least one of these shall be supplied.
[EAI_SERVICE]	The service passed was not recognized for the specified socket type.
[EAI_SOCKTYPE]	The intended socket type was not recognized.
[EAI_SYSTEM]	A system error occurred; the error code can be found in *errno*.
[EAI_OVERFLOW]	An argument buffer overflowed.

EXAMPLES

None.

APPLICATION USAGE

If the caller handles only TCP and not UDP, for example, then the *ai_protocol* member of the *hints* structure should be set to IPPROTO_TCP when *getaddrinfo*( ) is called.

If the caller handles only IPv4 and not IPv6, then the *ai_family* member of the *hints* structure should be set to AF_INET when *getaddrinfo*( ) is called.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

connect( ), *gai_strerror*( ), *gethostbyname*( ), *getnameinfo*( ), *getservbyname*( ), *socket*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<netdb.h>**, **<sys/socket.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getaddrinfo*( ) prototype for alignment with the ISO / IEC 9899: 1999 standard.

NAME

freopen — open a stream

SYNOPSIS

```
#include <stdio.h>

FILE *freopen(const char *restrict filename, const char *restrict mode,
    FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *freopen*( ) function shall first attempt to flush the stream and close any file descriptor associated with *stream*. Failure to flush or close the file descriptor successfully shall be ignored. The error and end-of-file indicators for the stream shall be cleared.

The *freopen*( ) function shall open the file whose pathname is the string pointed to by *filename* and associate the stream pointed to by *stream* with it. The *mode* argument shall be used just as in *fopen*( ).

The original stream shall be closed regardless of whether the subsequent open succeeds.

If *filename* is a null pointer, the *freopen*( ) function shall attempt to change the mode of the stream to that specified by *mode*, as if the name of the file currently associated with the stream had been used. It is implementation-defined which changes of mode are permitted (if any), and under what circumstances.

XSI After a successful call to the *freopen*( ) function, the orientation of the stream shall be cleared, the encoding rule shall be cleared, and the associated **mbstate_t** object shall be set to describe an initial conversion state.

CX The largest value that can be represented correctly in an object of type **off_t** shall be established as the offset maximum in the open file description.

RETURN VALUE

Upon successful completion, *freopen*( ) shall return the value of *stream*. Otherwise, a null pointer shall be returned, CX and *errno* shall be set to indicate the error.

ERRORS

The *freopen*( ) function shall fail if:

CX	[EACCES]	Search permission is denied on a component of the path prefix, or the file exists and the permissions specified by *mode* are denied, or the file does not exist and write permission is denied for the parent directory of the file to be created.
CX	[EINTR]	A signal was caught during *freopen*( ).
CX	[EISDIR]	The named file is a directory and *mode* requires write access.
CX	[ELOOP]	A loop exists in symbolic links encountered during resolution of the *path* argument.
CX	[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
CX	[ENAMETOOLONG]	The length of the *filename* argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.

CX	[ENFILE]	The maximum allowable number of files is currently open in the system.
CX	[ENOENT]	A component of *filename* does not name an existing file or *filename* is an empty string.
CX	[ENOSPC]	The directory or file system that would contain the new file cannot be expanded, the file does not exist, and it was to be created.
CX	[ENOTDIR]	A component of the path prefix is not a directory.
CX	[ENXIO]	The named file is a character special or block special file, and the device associated with this special file does not exist.
CX	[EOVERFLOW]	The named file is a regular file and the size of the file cannot be represented correctly in an object of type **off_t**.
CX	[EROFS]	The named file resides on a read-only file system and *mode* requires write access.

The *freopen*( ) function may fail if:

CX	[EINVAL]	The value of the *mode* argument is not valid.
CX	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.
CX	[ENAMETOOLONG]	Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.
CX	[ENOMEM]	Insufficient storage space is available.
CX	[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.
CX	[ETXTBSY]	The file is a pure procedure (shared text) file that is being executed and *mode* requires write access.

EXAMPLES

Directing Standard Output to a File

The following example logs all standard output to the **/tmp/logfile** file.

```
#include <stdio.h>
...
FILE *fp;
...
fp = freopen ("/tmp/logfile", "a+", stdout);
...
```

APPLICATION USAGE

The *freopen*( ) function is typically used to attach the preopened *streams* associated with *stdin*, *stdout*, and *stderr* to other files.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

fclose( ), *fopen*( ), *fdopen*( ), *mbsinit*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate that the orientation of the stream is cleared and the conversion state of the stream is set to an initial conversion state by a successful call to the *freopen*( ) function.

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification: |

- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support large files.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [EINVAL], [ENOMEM], [ENXIO], and [ETXTBSY] optional error conditions are added.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The *freopen*( ) prototype is updated.
- The DESCRIPTION is updated.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

The DESCRIPTION is updated regarding failure to close, changing the ‘‘file’’ to ‘‘file descriptor’’.

NAME

frexp, frexpf, frexpl — extract mantissa and exponent from a double precision number

SYNOPSIS

```
#include <math.h>

double frexp(double num, int *exp);
float frexpf(float num, int *exp);
long double frexpl(long double num, int *exp);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall break a floating-point number *num* into a normalized fraction and an integral power of 2. The integer exponent shall be stored in the **int** object pointed to by *exp*.

RETURN VALUE

For finite arguments, these functions shall return the value *x*, such that *x* has a magnitude in the interval [½,1) or 0, and *num* equals *x* times 2 raised to the power **exp*.

MX If *num* is NaN, a NaN shall be returned, and the value of **exp* is unspecified.

If *num* is ±0, ±0 shall be returned, and the value of **exp* shall be 0.

If *num* is ±Inf, *num* shall be returned, and the value of **exp* is unspecified.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *frexpf*( ) and *frexpl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

fscanf, scanf, sscanf — convert formatted input

SYNOPSIS

```
#include <stdio.h>

int fscanf(FILE *restrict stream, const char *restrict format, ... );
int scanf(const char *restrict format, ... );
int sscanf(const char *restrict s, const char *restrict format, ... );
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fscanf*( ) function shall read from the named input *stream*. The *scanf*( ) function shall read from the standard input stream *stdin*. The *sscanf*( ) function shall read from the string *s*. Each function reads bytes, interprets them according to a format, and stores the results in its arguments. Each expects, as arguments, a control string *format* described below, and a set of *pointer* arguments indicating where the converted input should be stored. The result is undefined if there are insufficient arguments for the format. If the format is exhausted while arguments remain, the excess arguments shall be evaluated but otherwise ignored. |

XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than to the next unused argument. In this case, the conversion specifier character `%` (see below) is replaced by the sequence `"%n$"`, where *n* is a decimal integer in the range [1,{NL_ARGMAX}]. This feature provides for the definition of format strings that select arguments in an order appropriate to specific languages. In format strings containing the `"%n$"` form of conversion specifications, it is unspecified whether numbered arguments in the argument list can be referenced from the format string more than once.

The *format* can contain either form of a conversion specification—that is, `%` or `"%n$"`—but the two forms cannot be mixed within a single *format* string. The only exception to this is that `%%` or `%*` can be mixed with the `"%n$"` form. When numbered argument specifications are used, specifying the *N*th argument requires that all the leading arguments, from the first to the (*N*−1)th, are pointers. |

CX The *fscanf*( ) function in all its forms shall allow detection of a language-dependent radix character in the input string. The radix character is defined in the program's locale (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a period (`'.'`). |

The format is a character string, beginning and ending in its initial shift state, if any, composed of zero or more directives. Each directive is composed of one of the following: one or more white-space characters (<space>s, <tab>s, <newline>s, <vertical-tab>s, or <form-feed>s); an ordinary character (neither `'%'` nor a white-space character); or a conversion specification. Each conversion specification is introduced by the character `'%'` XSI or the character sequence `"%n$"`, after which the following appear in sequence:

- An optional assignment-suppressing character `'*'`.
- An optional non-zero decimal integer that specifies the maximum field width.
- An option length modifier that specifies the size of the receiving object.
- A *conversion specifier* character that specifies the type of conversion to be applied. The valid conversion specifiers are described below.

The *fscanf*( ) functions shall execute each directive of the format in turn. If a directive fails, as detailed below, the function shall return. Failures are described as input failures (due to the unavailability of input bytes) or matching failures (due to inappropriate input).

A directive composed of one or more white-space characters shall be executed by reading input until no more valid input can be read, or up to the first byte which is not a white-space character, which remains unread.

A directive that is an ordinary character shall be executed as follows: the next byte shall be read from the input and compared with the byte that comprises the directive; if the comparison shows that they are not equivalent, the directive shall fail, and the differing and subsequent bytes shall remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a character from being read, the directive shall fail.

A directive that is a conversion specification defines a set of matching input sequences, as described below for each conversion character. A conversion specification shall be executed in the following steps.

Input white-space characters (as specified by *isspace*( )) shall be skipped, unless the conversion specification includes a `[`, `c`, `C`, or `n` conversion specifier.

An item shall be read from the input, unless the conversion specification includes an `n` conversion specifier. An input item shall be defined as the longest sequence of input bytes (up to any specified maximum field width, which may be measured in characters or bytes dependent on the conversion specifier) which is an initial subsequence of a matching sequence. The first byte, if any, after the input item shall remain unread. If the length of the input item is 0, the execution of the conversion specification shall fail; this condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is an input failure.

Except in the case of a `%` conversion specifier, the input item (or, in the case of a `%n` conversion specification, the count of input bytes) shall be converted to a type appropriate to the conversion character. If the input item is not a matching sequence, the execution of the conversion specification fails; this condition is a matching failure. Unless assignment suppression was indicated by a `'*'`, the result of the conversion shall be placed in the object pointed to by the first argument following the *format* argument that has not already received a conversion result if the conversion specification is introduced by `%`, or in the *n*th argument if introduced by the character sequence `"%n$"`. If this object does not have an appropriate type, or if the result of the conversion cannot be represented in the space provided, the behavior is undefined.

The length modifiers and their meanings are:

`hh`	Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **signed char** or **unsigned char**.
`h`	Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **short** or **unsigned short**.
`l` (ell)	Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **long** or **unsigned long**; that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier applies to an argument with type pointer to **double**; or that a following `c`, `s`, or `[` conversion specifier applies to an argument with type pointer to **wchar_t**.
`ll` (ell-ell)	Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **long long** or **unsigned long long**.

`j` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **intmax_t** or **uintmax_t**.

`z` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **size_t** or the corresponding signed integer type.

`t` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **ptrdiff_t** or the corresponding **unsigned** type.

`L` Specifies that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier applies to an argument with type pointer to **long double**.

If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.

The following conversion specifiers are valid:

`d` Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of *strtol*( ) with the value 10 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **int**.

`i` Matches an optionally signed integer, whose format is the same as expected for the subject sequence of *strtol*( ) with 0 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **int**.

`o` Matches an optionally signed octal integer, whose format is the same as expected for the subject sequence of *strtoul*( ) with the value 8 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

`u` Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of *strtoul*( ) with the value 10 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

`x` Matches an optionally signed hexadecimal integer, whose format is the same as expected for the subject sequence of *strtoul*( ) with the value 16 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

`a`, `e`, `f`, `g`

Matches an optionally signed floating-point number, infinity, or NaN, whose format is the same as expected for the subject sequence of *strtod*( ). In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **float**.

If the *fprintf*( ) family of functions generates character string representations for infinity and NaN (a symbolic entity encoded in floating-point format) to support IEEE Std 754-1985, the *fscanf*( ) family of functions shall recognize them as input.

`s` Matches a sequence of bytes that are not white-space characters. The application shall ensure that the corresponding argument is a pointer to the initial byte of an array of **char**, **signed char**, or **unsigned char** large enough to accept the sequence and a terminating null character code, which shall be added automatically.

If an `l` (ell) qualifier is present, the input is a sequence of characters that begins in the initial shift state. Each character shall be converted to a wide character as if by a call to the *mbrtowc*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first character is converted. The application shall ensure that the corresponding argument is a pointer to an array of **wchar_t** large enough to accept the sequence and the terminating null wide character, which shall be added automatically.

`[` Matches a non-empty sequence of bytes from a set of expected bytes (the *scanset*). The normal skip over white-space characters shall be suppressed in this case. The application shall ensure that the corresponding argument is a pointer to the initial byte of an array of **char**, **signed char**, or **unsigned char** large enough to accept the sequence and a terminating null byte, which shall be added automatically.

If an `l` (ell) qualifier is present, the input is a sequence of characters that begins in the initial shift state. Each character in the sequence shall be converted to a wide character as if by a call to the *mbrtowc*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first character is converted. The application shall ensure that the corresponding argument is a pointer to an array of **wchar_t** large enough to accept the sequence and the terminating null wide character, which shall be added automatically.

The conversion specification includes all subsequent bytes in the *format* string up to and including the matching right square bracket (`']'`). The bytes between the square brackets (the *scanlist*) comprise the scanset, unless the byte after the left square bracket is a circumflex (`'^'`), in which case the scanset contains all bytes that do not appear in the scanlist between the circumflex and the right square bracket. If the conversion specification begins with `"[]"` or `"[^]"`, the right square bracket is included in the scanlist and the next right square bracket is the matching right square bracket that ends the conversion specification; otherwise, the first right square bracket is the one that ends the conversion specification. If a `'−'` is in the scanlist and is not the first character, nor the second where the first character is a `'^'`, nor the last character, the behavior is implementation-defined.

`c` Matches a sequence of bytes of the number specified by the field width (1 if no field width is present in the conversion specification). The application shall ensure that the corresponding argument is a pointer to the initial byte of an array of **char**, **signed char**, or **unsigned char** large enough to accept the sequence. No null byte is added. The normal skip over white-space characters shall be suppressed in this case.

If an `l` (ell) qualifier is present, the input shall be a sequence of characters that begins in the initial shift state. Each character in the sequence is converted to a wide character as if by a call to the *mbrtowc*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first character is converted. The application shall ensure that the corresponding argument is a pointer to an array of **wchar_t** large enough to accept the resulting sequence of wide characters. No null wide character is added.

`p` Matches an implementation-defined set of sequences, which shall be the same as the set of sequences that is produced by the `%p` conversion specification of the corresponding *fprintf*( ) functions. The application shall ensure that the corresponding argument is a pointer to a pointer to **void**. The interpretation of the input item is implementation-defined. If the input item is a value converted earlier during the same program execution, the pointer that results shall compare equal to that value; otherwise, the behavior of the `%p` conversion specification is undefined.

`n` No input is consumed. The application shall ensure that the corresponding argument is a pointer to the integer into which shall be written the number of bytes read from the input so far by this call to the *fscanf*( ) functions. Execution of a `%n` conversion specification shall not increment the assignment count returned at the completion of execution of the function. No argument shall be converted, but one shall be consumed. If the conversion specification includes an assignment-suppressing character or a field width, the behavior is undefined.

XSI `C` Equivalent to `lc`.

XSI `S` Equivalent to `ls`.

`%` Matches a single `'%'` character; no conversion or assignment occurs. The complete conversion specification shall be `%%`.

If a conversion specification is invalid, the behavior is undefined.

The conversion specifiers `A`, `E`, `F`, `G`, and `X` are also valid and shall be equivalent to `a`, `e`, `f`, `g`, and `x`, respectively.

If end-of-file is encountered during input, conversion shall be terminated. If end-of-file occurs before any bytes matching the current conversion specification (except for `%n`) have been read (other than leading white-space characters, where permitted), execution of the current conversion specification shall terminate with an input failure. Otherwise, unless execution of the current conversion specification is terminated with a matching failure, execution of the following conversion specification (if any) shall be terminated with an input failure.

Reaching the end of the string in *sscanf*( ) shall be equivalent to encountering end-of-file for *fscanf*( ).

If conversion terminates on a conflicting input, the offending input is left unread in the input. Any trailing white space (including <newline>s) shall be left unread unless matched by a conversion specification. The success of literal matches and suppressed assignments is only directly determinable via the `%n` conversion specification.

CX The *fscanf*( ) and *scanf*( ) functions may mark the *st_atime* field of the file associated with *stream* for update. The *st_atime* field shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ), *fread*( ), *getc*( ), *getchar*( ), *gets*( ), *fscanf*( ), or *fscanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ).

RETURN VALUE

Upon successful completion, these functions shall return the number of successfully matched and assigned input items; this number can be zero in the event of an early matching failure. If the input ends before the first matching failure or conversion, EOF shall be returned. If a read error occurs, the error indicator for the stream is set, EOF shall be returned, CX and *errno* shall be set to indicate the error.

ERRORS

For the conditions under which the *fscanf*( ) functions fail and may fail, refer to *fgetc*( ) or *fgetwc*( ).

In addition, *fscanf*( ) may fail if:

XSI [EILSEQ] Input byte sequence does not form a valid character.

XSI [EINVAL] There are insufficient arguments.

EXAMPLES

The call:

```
int i, n; float x; char name[50];
n = scanf("%d%f%s", &i, &x, name);
```

with the input line:

```
25 54.32E-1 Hamster
```

assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string `"Hamster"`.

The call:

```
int i; float x; char name[50];
(void) scanf("%2d%f%*d %[0123456789]", &i, &x, name);
```

with input:

```
56789 0123 56a72
```

assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string `"56\0"` in *name*. The next call to *getchar*( ) shall return the character `'a'`.

Reading Data into an Array

The following call uses *fscanf*( ) to read three floating-point numbers from standard input into the *input* array.

```
float input[3]; fscanf (stdin, "%f %f %f", input, input+1, input+2);
```

APPLICATION USAGE

If the application calling *fscanf*( ) has any objects of type **wint_t** or **wchar_t**, it must also include the **<wchar.h>** header to have these objects defined.

RATIONALE

This function is aligned with the ISO/IEC 9899:1999 standard, and in doing so a few ‘‘obvious’’ things were not included. Specifically, the set of characters allowed in a scanset is limited to single-byte characters. In other similar places, multi-byte characters have been permitted, but for alignment with the ISO/IEC 9899:1999 standard, it has not been done here. Applications needing this could use the corresponding wide-character functions to achieve the desired results.

FUTURE DIRECTIONS

None.

SEE ALSO

getc( ), *printf*( ), *setlocale*( ), *strtod*( ), *strtol*( ), *strtoul*( ), *wcrtomb*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<langinfo.h>**, **<stdio.h>**, **<wchar.h>**, the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 7, Locale

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the `l` (ell) qualifier is now defined for the `c`, `s`, and `[` conversion specifiers.

The DESCRIPTION is updated to indicate that if infinity and NaN can be generated by the *fprintf*( ) family of functions, then they are recognized by the *fscanf*( ) family.

Issue 6

The Open Group Corrigendum U021/7 and U028/10 are applied. These correct several occurrences of ‘‘characters’’ in the text which have been replaced with the term ‘‘bytes’’.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototypes for *fscanf*( ), *scanf*( ), and *sscanf*( ) are updated.
- The DESCRIPTION is updated. |
- The `hh`, `ll`, `j`, `t`, and `z` length modifiers are added. |
- The `a`, `A`, and `F` conversion characters are added. |

The DESCRIPTION is updated to use the terms ‘‘conversion specifier’’ and ‘‘conversion specification’’ consistently.

NAME

fseek, fseeko — reposition a file-position indicator in a stream

SYNOPSIS

```
#include <stdio.h>

int fseek(FILE *stream, long offset, int whence);
CX int fseeko(FILE *stream, off_t offset, int whence);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fseek*( ) function shall set the file-position indicator for the stream pointed to by *stream*. If a read or write error occurs, the error indicator for the stream shall be set and *fseek*( ) fails.

The new position, measured in bytes from the beginning of the file, shall be obtained by adding *offset* to the position specified by *whence*. The specified point is the beginning of the file for SEEK_SET, the current value of the file-position indicator for SEEK_CUR, or end-of-file for SEEK_END.

If the stream is to be used with wide-character input/output functions, the application shall ensure that *offset* is either 0 or a value returned by an earlier call to *ftell*( ) on the same stream and *whence* is SEEK_SET.

A successful call to *fseek*( ) shall clear the end-of-file indicator for the stream and undo any effects of *ungetc*( ) and *ungetwc*( ) on the same stream. After an *fseek*( ) call, the next operation on an update stream may be either input or output.

CX If the most recent operation, other than *ftell*( ), on a given stream is *fflush*( ), the file offset in the underlying open file description shall be adjusted to reflect the location specified by *fseek*( ).

The *fseek*( ) function shall allow the file-position indicator to be set beyond the end of existing data in the file. If data is later written at this point, subsequent reads of data in the gap shall return bytes with the value 0 until data is actually written into the gap.

The behavior of *fseek*( ) on devices which are incapable of seeking is implementation-defined. The value of the file offset associated with such a device is undefined.

If the stream is writable and buffered data had not been written to the underlying file, *fseek*( ) shall cause the unwritten data to be written to the file and shall mark the *st_ctime* and *st_mtime* fields of the file for update.

In a locale with state-dependent encoding, whether *fseek*( ) restores the stream's shift state is implementation-defined.

The *fseeko*( ) function shall be equivalent to the *fseek*( ) function except that the *offset* argument is of type **off_t**.

RETURN VALUE

CX The *fseek*( ) and *fseeko*( ) functions shall return 0 if they succeed.

CX Otherwise, they shall return −1 and set *errno* to indicate the error.

ERRORS

CX The *fseek*( ) and *fseeko*( ) functions shall fail if, either the *stream* is unbuffered or the *stream*'s buffer needed to be flushed, and the call to *fseek*( ) or *fseeko*( ) causes an underlying *lseek*( ) or *write*( ) to be invoked, and:

CX	[EAGAIN]	The O_NONBLOCK flag is set for the file descriptor and the process would be delayed in the write operation.
CX	[EBADF]	The file descriptor underlying the stream file is not open for writing or the stream's buffer needed to be flushed and the file is not open.
CX	[EFBIG]	An attempt was made to write a file that exceeds the maximum file size.
XSI	[EFBIG]	An attempt was made to write a file that exceeds the process' file size limit.
CX	[EFBIG]	The file is a regular file and an attempt was made to write at or beyond the offset maximum associated with the corresponding stream.
CX	[EINTR]	The write operation was terminated due to the receipt of a signal, and no data was transferred.
CX	[EINVAL]	The *whence* argument is invalid. The resulting file-position indicator would be set to a negative value.
CX	[EIO]	A physical I/O error has occurred, or the process is a member of a background process group attempting to perform a *write*( ) to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.
CX	[ENOSPC]	There was no free space remaining on the device containing the file.
CX	[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.
CX	[EOVERFLOW]	For *fseek*( ), the resulting file offset would be a value which cannot be represented correctly in an object of type **long**.
CX	[EOVERFLOW]	For *fseeko*( ), the resulting file offset would be a value which cannot be represented correctly in an object of type **off_t**.
CX	[EPIPE]	An attempt was made to write to a pipe or FIFO that is not open for reading by any process; a SIGPIPE signal shall also be sent to the thread.
CX	[ESPIPE]	The file descriptor underlying *stream* is associated with a pipe or FIFO.

SEE ALSO

fopen( ), *fsetpos*( ), *ftell*( ), *getrlimit*( ), *lseek*( ), *rewind*( ), *ulimit*( ), *ungetc*( ), *write*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The *fseeko*( ) function is added.
- The [EFBIG], [EOVERFLOW], and [ENXIO] mandatory error conditions are added.

The following change is incorporated for alignment with the FIPS requirements:

- The [EINTR] error is no longer an indication that the implementation does not report partial transfers.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The DESCRIPTION is updated to explicitly state that *fseek*( ) sets the file-position indicator, and then on error the error indicator is set and *fseek*( ) fails. This is for alignment with the ISO/IEC 9899: 1999 standard.

NAME

fsetpos — set current file position

SYNOPSIS

```
#include <stdio.h>

int fsetpos(FILE *stream, const fpos_t *pos);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fsetpos*( ) function shall set the file position and state indicators for the stream pointed to by *stream* according to the value of the object pointed to by *pos*, which the application shall ensure is a value obtained from an earlier call to *fgetpos*( ) on the same stream. If a read or write error occurs, the error indicator for the stream shall be set and *fsetpos*( ) fails.

A successful call to the *fsetpos*( ) function shall clear the end-of-file indicator for the stream and undo any effects of *ungetc*( ) on the same stream. After an *fsetpos*( ) call, the next operation on an update stream may be either input or output.

CX The behavior of *fsetpos*( ) on devices which are incapable of seeking is implementation-defined. The value of the file offset associated with such a device is undefined.

RETURN VALUE

The *fsetpos*( ) function shall return 0 if it succeeds; otherwise, it shall return a non-zero value and set *errno* to indicate the error.

ERRORS

CX The *fsetpos*( ) function shall fail if, either the *stream* is unbuffered or the *stream*'s buffer needed to be flushed, and the call to *fsetpos*( ) causes an underlying *lseek*( ) or *write*( ) to be invoked, and:

CX	[EAGAIN]	The O_NONBLOCK flag is set for the file descriptor and the process would be delayed in the write operation.
CX	[EBADF]	The file descriptor underlying the stream file is not open for writing or the stream's buffer needed to be flushed and the file is not open.
CX	[EFBIG]	An attempt was made to write a file that exceeds the maximum file size.
XSI	[EFBIG]	An attempt was made to write a file that exceeds the process' file size limit.
CX	[EFBIG]	The file is a regular file and an attempt was made to write at or beyond the offset maximum associated with the corresponding stream.
CX	[EINTR]	The write operation was terminated due to the receipt of a signal, and no data was transferred.
CX	[EINVAL]	The *whence* argument is invalid. The resulting file-position indicator would be set to a negative value.
CX	[EIO]	A physical I/O error has occurred, or the process is a member of a background process group attempting to perform a *write*( ) to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.
CX	[ENOSPC]	There was no free space remaining on the device containing the file.

CX	[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.
CX	[EPIPE]	The file descriptor underlying *stream* is associated with a pipe or FIFO.
CX	[EPIPE]	An attempt was made to write to a pipe or FIFO that is not open for reading by any process; a SIGPIPE signal shall also be sent to the thread.

EXAMPLES

fopen( ), *ftell*( ), *lseek*( ), *rewind*( ), *ungetc*( ), *write*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 4. Derived from the ISO C standard.

Issue 6

Extensions beyond the ISO C standard are now marked.

An additional [ESPIPE] error condition is added for sockets.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The DESCRIPTION is updated to clarify that the error indicator is set for the stream on a read or write error. This is for alignment with the ISO / IEC 9899: 1999 standard.

NAME

fstat — get file status

SYNOPSIS

```
#include <sys/stat.h>

int fstat(int fildes, struct stat *buf);
```

DESCRIPTION

The *fstat*( ) function shall obtain information about an open file associated with the file descriptor *fildes*, and shall write it to the area pointed to by *buf*.

SHM If *fildes* references a shared memory object, the implementation shall update in the **stat** structure pointed to by the *buf* argument only the *st_uid*, *st_gid*, *st_size*, and *st_mode* fields, and only the S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits need be valid. The implementation may update other fields and flags.

TYM If *fildes* references a typed memory object, the implementation shall update in the **stat** structure pointed to by the *buf* argument only the *st_uid*, *st_gid*, *st_size*, and *st_mode* fields, and only the S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits need be valid. The implementation may update other fields and flags.

The *buf* argument is a pointer to a **stat** structure, as defined in **<sys/stat.h>**, into which information is placed concerning the file.

The structure members *st_mode*, *st_ino*, *st_dev*, *st_uid*, *st_gid*, *st_atime*, *st_ctime*, and *st_mtime* shall have meaningful values for all other file types defined in this volume of IEEE Std 1003.1-200x. The value of the member *st_nlink* shall be set to the number of links to the file.

An implementation that provides additional or alternative file access control mechanisms may, under implementation-defined conditions, cause *fstat*( ) to fail.

The *fstat*( ) function shall update any time-related fields as described in the Base Definitions volume of IEEE Std 1003.1-200x, Section 4.7, File Times Update, before writing into the **stat** structure.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *fstat*( ) function shall fail if:

[EBADF]	The *fildes* argument is not a valid file descriptor.
[EIO]	An I/O error occurred while reading from the file system.
[EOVERFLOW]	The file size in bytes or the number of blocks allocated to the file or the file serial number cannot be represented correctly in the structure pointed to by *buf*.

The *fstat*( ) function may fail if:

[EOVERFLOW]	One of the values is too large to store into the structure pointed to by the *buf* argument.

EXAMPLES

Obtaining File Status Information

The following example shows how to obtain file status information for a file named **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure. The **/home/cnd/mod1** file is opened with read/write privileges and is passed to the open file descriptor *fildes*.

```
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>

struct stat buffer;
int         status;
...
fildes = open("/home/cnd/mod1", O_RDWR);
status = fstat(fildes, &buffer);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

lstat( ), *stat*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/stat.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EIO] mandatory error condition is added.
- The [EOVERFLOW] mandatory error condition is added. This change is to support large files.
- The [EOVERFLOW] optional error condition is added.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that shared memory object semantics apply to typed memory objects.

NAME

fstatvfs, statvfs — get file system information

SYNOPSIS

XSI

```
#include <sys/statvfs.h>

int fstatvfs(int fildes, struct statvfs *buf);
int statvfs(const char *restrict path, struct statvfs *restrict buf);
```

DESCRIPTION

The *fstatvfs*( ) function shall obtain information about the file system containing the file referenced by *fildes*.

The *statvfs*( ) function shall obtain information about the file system containing the file named by *path*.

For both functions, the *buf* argument is a pointer to a **statvfs** structure that shall be filled. Read, write, or execute permission of the named file is not required.

The following flags can be returned in the *f_flag* member:

ST_RDONLY	Read-only file system.
ST_NOSUID	Setuid/setgid bits ignored by *exec*.

It is unspecified whether all members of the **statvfs** structure have meaningful values on all file systems.

RETURN VALUE

Upon successful completion, *statvfs*( ) shall return 0. Otherwise, it shall return −1 and set *errno* to indicate the error.

ERRORS

The *fstatvfs*( ) and *statvfs*( ) functions shall fail if:

[EIO]	An I/O error occurred while reading the file system.
[EINTR]	A signal was caught during execution of the function.
[EOVERFLOW]	One of the values to be returned cannot be represented correctly in the structure pointed to by *buf*.

The *fstatvfs*( ) function shall fail if:

[EBADF]	The *fildes* argument is not an open file descriptor.

The *statvfs*( ) function shall fail if:

[EACCES]	Search permission is denied on a component of the path prefix.
[ELOOP]	A loop exists in symbolic links encountered during resolution of the *path* argument.
[ENAMETOOLONG]	The length of a pathname exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
[ENOENT]	A component of *path* does not name an existing file or *path* is an empty string.
[ENOTDIR]	A component of the path prefix of *path* is not a directory.

The *statvfs*( ) function may fail if:

[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.
[ENAMETOOLONG]	Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.

EXAMPLES

Obtaining File System Information Using fstatvfs( )

The following example shows how to obtain file system information for the file system upon which the file named **/home/cnd/mod1** resides, using the *fstatvfs*( ) function. The **/home/cnd/mod1** file is opened with read/write privileges and the open file descriptor is passed to the *fstatvfs*( ) function.

```
#include <statvfs.h>
#include <fcntl.h>

struct statvfs buffer;
int            status;
...
fildes = open("/home/cnd/mod1", O_RDWR);
status  = fstatvfs(fildes, &buffer);
```

Obtaining File System Information Using statvfs( )

The following example shows how to obtain file system information for the file system upon which the file named **/home/cnd/mod1** resides, using the *statvfs*( ) function.

```
#include <statvfs.h>

struct statvfs buffer;
int            status;
...
status = statvfs("/home/cnd/mod1", &buffer);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

chmod( ), *chown*( ), *creat*( ), *dup*( ), *exec*, *fcntl*( ), *link*( ), *mknod*( ), *open*( ), *pipe*( ), *read*( ), *time*( ), *unlink*( ), *utime*( ), *write*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/statvfs.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Large File Summit extensions are added.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The **restrict** keyword is added to the *statvfs*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

NAME

fsync — synchronize changes to a file

SYNOPSIS

FSC
```
#include <unistd.h>

int fsync(int fildes);
```

DESCRIPTION

The *fsync*( ) function shall request that all data for the open file descriptor named by *fildes* is to be transferred to the storage device associated with the file described by *fildes* in an implementation-defined manner. The *fsync*( ) function shall not return until the system has completed that action or until an error is detected.

SIO If _POSIX_SYNCHRONIZED_IO is defined, the *fsync*( ) function shall force all currently queued I/O operations associated with the file indicated by file descriptor *fildes* to the synchronized I/O completion state. All I/O operations shall be completed as defined for synchronized I/O file integrity completion.

RETURN VALUE

Upon successful completion, *fsync*( ) shall return 0. Otherwise, −1 shall be returned and *errno* set to indicate the error. If the *fsync*( ) function fails, outstanding I/O operations are not guaranteed to have been completed.

ERRORS

The *fsync*( ) function shall fail if:

[EBADF]	The *fildes* argument is not a valid descriptor.
[EINTR]	The *fsync*( ) function was interrupted by a signal.
[EINVAL]	The *fildes* argument does not refer to a file on which this operation is possible.
[EIO]	An I/O error occurred while reading from or writing to the file system.

In the event that any of the queued I/O operations fail, *fsync*( ) shall return the error conditions defined for *read*( ) and *write*( ).

EXAMPLES

None.

APPLICATION USAGE

The *fsync*( ) function should be used by programs which require modifications to a file to be completed before continuing; for example, a program which contains a simple transaction facility might use it to ensure that all modifications to a file or files caused by a transaction are recorded.

RATIONALE

The *fsync*( ) function is intended to force a physical write of data from the buffer cache, and to assure that after a system crash or other failure that all data up to the time of the *fsync*( ) call is recorded on the disk. Since the concepts of ‘‘buffer cache’’, ‘‘system crash’’, ‘‘physical write’’, and ‘‘non-volatile storage’’ are not defined here, the wording has to be more abstract.

If _POSIX_SYNCHRONIZED_IO is not defined, the wording relies heavily on the conformance document to tell the user what can be expected from the system. It is explicitly intended that a null implementation is permitted. This could be valid in the case where the system cannot assure non-volatile storage under any circumstances or when the system is highly fault-tolerant and the functionality is not required. In the middle ground between these extremes, *fsync*( ) might or might not actually cause data to be written where it is safe from a power failure. The conformance document should identify at least that one configuration exists (and how to obtain that configuration) where this can be assured for at least some files that the user can select to use for critical data. It is not intended that an exhaustive list is required, but rather sufficient information is provided to let the user determine that if he or she has critical data he or she can configure her system to allow it to be written to non-volatile storage.

It is reasonable to assert that the key aspects of *fsync*( ) are unreasonable to test in a test suite. That does not make the function any less valuable, just more difficult to test. A formal conformance test should probably force a system crash (power shutdown) during the test for this condition, but it needs to be done in such a way that automated testing does not require this to be done except when a formal record of the results is being made. It would also not be unreasonable to omit testing for *fsync*( ), allowing it to be treated as a quality-of-implementation issue.

FUTURE DIRECTIONS

None.

SEE ALSO

sync( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<unistd.h>**

CHANGE HISTORY

First released in Issue 3.

Issue 5

Aligned with *fsync*( ) in the POSIX Realtime Extension. Specifically, the DESCRIPTION and RETURN VALUE sections are much expanded, and the ERRORS section is updated to indicate that *fsync*( ) can return the error conditions defined for *read*( ) and *write*( ).

Issue 6

This function is marked as part of the File Synchronization option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EINVAL] and [EIO] mandatory error conditions are added.

NAME

ftell, ftello — return a file offset in a stream

SYNOPSIS

```
#include <stdio.h>

long ftell(FILE *stream);
CX off_t ftello(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *ftell*( ) function shall obtain the current value of the file-position indicator for the stream pointed to by *stream*.

CX The *ftello*( ) function shall be equivalent to *ftell*( ), except that the return value is of type **off_t**. |

RETURN VALUE

CX Upon successful completion, *ftell*( ) and *ftello*( ) shall return the current value of the file-position indicator for the stream measured in bytes from the beginning of the file.

CX Otherwise, *ftell*( ) and *ftello*( ) shall return –1, cast to **long** and **off_t** respectively, and set *errno* to indicate the error.

ERRORS

CX The *ftell*( ) and *ftello*( ) functions shall fail if:

CX	[EBADF]	The file descriptor underlying *stream* is not an open file descriptor.
CX	[EOVERFLOW]	For *ftell*( ), the current file offset cannot be represented correctly in an object of type **long**.
CX	[EOVERFLOW]	For *ftello*( ), the current file offset cannot be represented correctly in an object of type **off_t**.
CX	[ESPIPE]	The file descriptor underlying *stream* is associated with a pipe or FIFO.

The *ftell*( ) function may fail if:

CX	[ESPIPE]	The file descriptor underlying *stream* is associated with a socket.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The *ftello*( ) function is added.
- The [EOVERFLOW] error conditions are added.

An additional [ESPIPE] error condition is added for sockets.

NAME

ftime — get date and time (**LEGACY**)

SYNOPSIS

XSI

```
#include <sys/timeb.h>

int ftime(struct timeb *tp);
```

DESCRIPTION

The *ftime*( ) function shall set the *time* and *millitm* members of the **timeb** structure pointed to by *tp* to contain the seconds and milliseconds portions, respectively, of the current time in seconds since the Epoch. The contents of the *timezone* and *dstflag* members of *tp* after a call to *ftime*( ) are unspecified.

The system clock need not have millisecond granularity. Depending on any granularity (particularly a granularity of one) renders code non-portable.

RETURN VALUE

Upon successful completion, the *ftime*( ) function shall return 0; otherwise, −1 shall be returned.

ERRORS

No errors are defined.

EXAMPLES

Getting the Current Time and Date

The following example shows how to get the current system time values using the *ftime*( ) function. The **timeb** structure pointed to by *tp* is filled with the current system time values for *time* and *millitm*.

```
#include <sys/timeb.h>

struct timeb tp;
int          status;
...
status = ftime(&tp);
```

APPLICATION USAGE

For applications portability, the *time*( ) function should be used to determine the current time instead of *ftime*( ). Realtime applications should use *clock_gettime*( ) to determine the current time instead of *ftime*( ).

RATIONALE

None.

FUTURE DIRECTIONS

This function may be withdrawn in a future version.

SEE ALSO

clock_getres( ), *ctime*( ), *gettimeofday*( ), *time*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/timeb.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

Issue 6

This function is marked LEGACY.

The DESCRIPTION is updated to refer to ‘‘seconds since the Epoch’’ rather than ‘‘seconds since 00:00:00 UTC (Coordinated Universal Time), January 1 1970’’ for consistency with other *time* functions.

NAME

ftok — generate an IPC key

SYNOPSIS

XSI
```
#include <sys/ipc.h>

key_t ftok(const char *path, int id);
```

DESCRIPTION

The *ftok*( ) function shall return a key based on *path* and *id* that is usable in subsequent calls to *msgget*( ), *semget*( ), and *shmget*( ). The application shall ensure that the *path* argument is the pathname of an existing file that the process is able to *stat*( ). |

The *ftok*( ) function shall return the same key value for all paths that name the same file, when called with the same *id* value, and return different key values when called with different *id* values or with paths that name different files existing on the same file system at the same time. It is unspecified whether *ftok*( ) shall return the same key value when called again after the file named by *path* is removed and recreated with the same name.

Only the low order 8-bits of *id* are significant. The behavior of *ftok*( ) is unspecified if these bits are 0.

RETURN VALUE

Upon successful completion, *ftok*( ) shall return a key. Otherwise, *ftok*( ) shall return (**key_t**)−1 and set *errno* to indicate the error.

ERRORS

The *ftok*( ) function shall fail if:

[EACCES] Search permission is denied for a component of the path prefix.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of the *path* argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}. |

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix is not a directory.

The *ftok*( ) function may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}. |

EXAMPLES

Getting an IPC Key

The following example gets a unique key that can be used by the IPC functions *semget*( ), *msgget*( ), and *shmget*( ). The key returned by *ftok*( ) for this example is based on the ID value *S* and the pathname **/tmp**. |

```
#include <sys/ipc.h>
...
key_t key;
char *path = "/tmp";
int id = 'S';

key = ftok(path, id);
```

Saving an IPC Key

The following example gets a unique key based on the pathname **/tmp** and the ID value *a*. It also assigns the value of the resulting key to the *semkey* variable so that it will be available to a later call to *semget*( ), *msgget*( ), or *shmget*( ). |

```
#include <sys/ipc.h>
...
key_t semkey;

if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
    perror("IPC error: ftok"); exit(1);
}
```

APPLICATION USAGE

For maximum portability, *id* should be a single-byte character.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

msgget( ), *semget*( ), *shmget*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/ipc.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

NAME

ftruncate — truncate a file to a specified length

SYNOPSIS

```
#include <unistd.h>

int ftruncate(int fildes, off_t length);
```

DESCRIPTION

If *fildes* is not a valid file descriptor open for writing, the *ftruncate*( ) function shall fail.

If *fildes* refers to a regular file, the *ftruncate*( ) function shall cause the size of the file to be truncated to *length*. If the size of the file previously exceeded *length*, the extra data shall no longer be available to reads on the file. If the file previously was smaller than this size, *ftruncate*( ) shall either increase the size of the file or fail. XSI XSI-conformant systems shall increase the size of the file. If the file size is increased, the extended area shall appear as if it were zero-filled. The value of the seek pointer shall not be modified by a call to *ftruncate*( ).

Upon successful completion, if *fildes* refers to a regular file, the *ftruncate*( ) function shall mark for update the *st_ctime* and *st_mtime* fields of the file and the S_ISUID and S_ISGID bits of the file mode may be cleared. If the *ftruncate*( ) function is unsuccessful, the file is unaffected.

XSI If the request would cause the file size to exceed the soft file size limit for the process, the request shall fail and the implementation shall generate the SIGXFSZ signal for the thread.

If *fildes* refers to a directory, *ftruncate*( ) shall fail.

If *fildes* refers to any other file type, except a shared memory object, the result is unspecified.

SHM If *fildes* refers to a shared memory object, *ftruncate*( ) shall set the size of the shared memory object to *length*.

MF|SHM If the effect of *ftruncate*( ) is to decrease the size of a shared memory object or memory mapped file and whole pages beyond the new end were previously mapped, then the whole pages beyond the new end shall be discarded.

MPR If the Memory Protection option is supported, references to discarded pages shall result in the generation of a SIGBUS signal; otherwise, the result of such references is undefined.

MF|SHM If the effect of *ftruncate*( ) is to increase the size of a shared memory object, it is unspecified if the contents of any mapped pages between the old end-of-file and the new are flushed to the underlying object.

RETURN VALUE

Upon successful completion, *ftruncate*( ) shall return 0; otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *ftruncate*( ) function shall fail if:

[EINTR]	A signal was caught during execution.
[EINVAL]	The *length* argument was less than 0.
[EFBIG] or [EINVAL]	The *length* argument was greater than the maximum file size.
XSI [EFBIG]	The file is a regular file and *length* is greater than the offset maximum established in the open file description associated with *fildes*.
[EIO]	An I/O error occurred while reading from or writing to a file system.

[EBADF] or [EINVAL]	The *fildes* argument is not a file descriptor open for writing.
[EINVAL]	The *fildes* argument references a file that was opened without write permission.
[EROFS]	The named file resides on a read-only file system.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *ftruncate*( ) function is part of IEEE Std 1003.1-200x as it was deemed to be more useful than *truncate*( ). The *truncate*( ) function is provided as an XSI extension.

FUTURE DIRECTIONS

None.

SEE ALSO

open( ), *truncate*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<unistd.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE and aligned with *ftruncate*( ) in the POSIX Realtime Extension. Specifically, the DESCRIPTION is extensively reworded and [EROFS] is added to the list of mandatory errors that can be returned by *ftruncate*( ).

Large File Summit extensions are added.

Issue 6

The *truncate*( ) function has been split out into a separate reference page.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is change to indicate that if the file size is changed, and if the file is a regular file, the S_ISUID and S_ISGID bits in the file mode may be cleared.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The DESCRIPTION text is updated.

XSI-conformant systems are required to increase the size of the file if the file was previously smaller than the size requested.

NAME

ftrylockfile — stdio locking functions

SYNOPSIS

TSF

```
#include <stdio.h>

int ftrylockfile(FILE *file);
```

DESCRIPTION

Refer to *flockfile*( ).

NAME

ftw — traverse (walk) a file tree

SYNOPSIS

XSI

```
#include <ftw.h>

int ftw(const char *path, int (*fn)(const char *,
    const struct stat *ptr, int flag), int ndirs);
```

DESCRIPTION

The *ftw*( ) function shall recursively descend the directory hierarchy rooted in *path*. For each object in the hierarchy, *ftw*( ) shall call the function pointed to by *fn*, passing it a pointer to a null-terminated character string containing the name of the object, a pointer to a **stat** structure containing information about the object, and an integer. Possible values of the integer, defined in the **<ftw.h>** header, are:

FTW_D	For a directory.
FTW_DNR	For a directory that cannot be read.
FTW_F	For a file.
FTW_SL	For a symbolic link (but see also FTW_NS below).
FTW_NS	For an object other than a symbolic link on which *stat*( ) could not successfully be executed. If the object is a symbolic link and *stat*( ) failed, it is unspecified whether *ftw*( ) passes FTW_SL or FTW_NS to the user-supplied function.

If the integer is FTW_DNR, descendants of that directory shall not be processed. If the integer is FTW_NS, the **stat** structure contains undefined values. An example of an object that would cause FTW_NS to be passed to the function pointed to by *fn* would be a file in a directory with read but without execute (search) permission.

The *ftw*( ) function shall visit a directory before visiting any of its descendants.

The *ftw*( ) function shall use at most one file descriptor for each level in the tree.

The argument *ndirs* should be in the range of 1 to {OPEN_MAX}.

The tree traversal shall continue until either the tree is exhausted, an invocation of *fn* returns a non-zero value, or some error, other than [EACCES], is detected within *ftw*( ).

The *ndirs* argument shall specify the maximum number of directory streams or file descriptors or both available for use by *ftw*( ) while traversing the tree. When *ftw*( ) returns it shall close any directory streams and file descriptors it uses not counting any opened by the application-supplied *fn* function.

The results are unspecified if the application-supplied *fn* function does not preserve the current working directory.

The *ftw*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

If the tree is exhausted, *ftw*( ) shall return 0. If the function pointed to by *fn* returns a non-zero value, *ftw*( ) shall stop its tree traversal and return whatever value was returned by the function pointed to by *fn*. If *ftw*( ) detects an error, it shall return −1 and set *errno* to indicate the error.

If *ftw*( ) encounters an error other than [EACCES] (see FTW_DNR and FTW_NS above), it shall return −1 and set *errno* to indicate the error. The external variable *errno* may contain any error value that is possible when a directory is opened or when one of the *stat* functions is executed on a directory or file.

ERRORS

The *ftw*( ) function shall fail if:

[EACCES] Search permission is denied for any component of *path* or read permission is denied for *path*.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG] The length of the *path* argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of *path* is not a directory.

[EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current programming environment for one or more files found in the file hierarchy.

The *ftw*( ) function may fail if:

[EINVAL] The value of the *ndirs* argument is invalid.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG] Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.

In addition, if the function pointed to by *fn* encounters system errors, *errno* may be set accordingly.

EXAMPLES

Walking a Directory Structure

The following example walks the current directory structure, calling the *fn* function for every directory entry, using at most 10 file descriptors:

```
#include <ftw.h>
...
if (ftw(".", fn, 10) != 0) {
    perror("ftw"); exit(2);
}
```

APPLICATION USAGE

The *ftw*( ) function may allocate dynamic storage during its operation. If *ftw*( ) is forcibly terminated, such as by *longjmp*( ) or *siglongjmp*( ) being executed by the function pointed to by *fn* or an interrupt routine, *ftw*( ) does not have a chance to free that storage, so it remains permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next invocation.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

UX codings in the DESCRIPTION, RETURN VALUE, and ERRORS sections have been changed to EX.

Issue 6

The ERRORS section is updated as follows:

- The wording of the mandatory [ELOOP] error condition is updated.
- A second optional [ELOOP] error condition is added.
- The [EOVERFLOW] mandatory error condition is added.

Text is added to the DESCRIPTION to say that the *ftw*( ) function need not be reentrant and that the results are unspecified if the application-supplied *fn* function does not preserve the current working directory.

NAME

funlockfile — stdio locking functions

SYNOPSIS

TSF

```
#include <stdio.h>

void funlockfile(FILE *file);
```

DESCRIPTION

Refer to *flockfile*( ).

NAME

fwide — set stream orientation

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

int fwide(FILE *stream, int mode);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fwide*( ) function shall determine the orientation of the stream pointed to by *stream*. If *mode* is greater than zero, the function first attempts to make the stream wide-oriented. If *mode* is less than zero, the function first attempts to make the stream byte-oriented. Otherwise, *mode* is zero and the function does not alter the orientation of the stream.

If the orientation of the stream has already been determined, *fwide*( ) shall not change it.

CX Since no return value is reserved to indicate an error, an application wishing to check for error situations should set *errno* to 0, then call *fwide*( ), then check *errno*, and if it is non-zero, assume an error has occurred.

RETURN VALUE

The *fwide*( ) function shall return a value greater than zero if, after the call, the stream has wide-orientation, a value less than zero if the stream has byte-orientation, or zero if the stream has no orientation.

ERRORS

The *fwide*( ) function may fail if:

CX [EBADF] The *stream* argument is not a valid stream.

EXAMPLES

None.

APPLICATION USAGE

A call to *fwide*( ) with *mode* set to zero can be used to determine the current orientation of a stream.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

Extensions beyond the ISO C standard are now marked.

NAME

fwprintf, swprintf, wprintf — print formatted wide-character output

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

int fwprintf(FILE *restrict stream, const wchar_t *restrict format, ...);
int swprintf(wchar_t *restrict ws, size_t n,
    const wchar_t *restrict format, ...);
int wprintf(const wchar_t *restrict format, ...);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fwprintf*( ) function shall place output on the named output *stream*. The *wprintf*( ) function shall place output on the standard output stream *stdout*. The *swprintf*( ) function shall place output followed by the null wide character in consecutive wide characters starting at **ws*; no more than *n* wide characters shall be written, including a terminating null wide character, which is always added (unless *n* is zero).

Each of these functions shall convert, format, and print its arguments under control of the *format* wide-character string. The *format* is composed of zero or more directives: *ordinary wide-characters*, which are simply copied to the output stream, and *conversion specifications*, each of which results in the fetching of zero or more arguments. The results are undefined if there are insufficient arguments for the *format*. If the *format* is exhausted while arguments remain, the excess arguments are evaluated but are otherwise ignored.

XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than to the next unused argument. In this case, the conversion specifier wide character % (see below) is replaced by the sequence `"%n$"`, where *n* is a decimal integer in the range [1,{NL_ARGMAX}], giving the position of the argument in the argument list. This feature provides for the definition of *format* wide-character strings that select arguments in an order appropriate to specific languages (see the EXAMPLES section).

The *format* can contain either numbered argument specifications (that is, `"%n$"` and `"*m$"`), or unnumbered argument conversion specifications (that is, % and *), but not both. The only exception to this is that %% can be mixed with the `"%n$"` form. The results of mixing numbered and unnumbered argument specifications in a *format* wide-character string are undefined. When numbered argument specifications are used, specifying the *N*th argument requires that all the leading arguments, from the first to the ($N-1$)th, are specified in the format wide-character string.

In *format* wide-character strings containing the `"%n$"` form of conversion specification, numbered arguments in the argument list can be referenced from the *format* wide-character string as many times as required.

In *format* wide-character strings containing the % form of conversion specification, each argument in the argument list shall be used exactly once.

CX All forms of the *fwprintf*( ) function allow for the insertion of a locale-dependent radix character in the output string, output as a wide-character value. The radix character is defined in the program's locale (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a period (`'.'`).

XSI Each conversion specification is introduced by the `'%'` wide character or by the wide-character sequence `"%n$"`, after which the following appear in sequence:

- Zero or more *flags* (in any order), which modify the meaning of the conversion specification.
- An optional minimum *field width*. If the converted value has fewer wide characters than the field width, it shall be padded with spaces by default on the left; it shall be padded on the right, if the left-adjustment flag (`'−'`), described below, is given to the field width. The field width takes the form of an asterisk (`'*'`), described below, or a decimal integer.
- An optional *precision* that gives the minimum number of digits to appear for the `d`, `i`, `o`, `u`, `x`, and `X` conversion specifiers; the number of digits to appear after the radix character for the `a`, `A`, `e`, `E`, `f`, and `F` conversion specifiers; the maximum number of significant digits for the `g` and `G` conversion specifiers; or the maximum number of wide characters to be printed from a string in the `s` conversion specifiers. The precision takes the form of a period (`'.'`) followed either by an asterisk (`'*'`), described below, or an optional decimal digit string, where a null digit string is treated as 0. If a precision appears with any other conversion wide character, the behavior is undefined.
- An optional length modifier that specifies the size of the argument.
- A *conversion specifier* wide character that indicates the type of conversion to be applied.

A field width, or precision, or both, may be indicated by an asterisk (`'*'`). In this case an argument of type **int** supplies the field width or precision. Applications shall ensure that arguments specifying field width, or precision, or both appear in that order before the argument, if any, to be converted. A negative field width is taken as a `'−'` flag followed by a positive field width. A negative precision is taken as if the precision were omitted. XSI In format wide-character strings containing the `"%n$"` form of a conversion specification, a field width or precision may be indicated by the sequence `"*m$"`, where *m* is a decimal integer in the range [1,{NL_ARGMAX}] giving the position in the argument list (after the format argument) of an integer argument containing the field width or precision, for example:

```
wprintf(L"%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```

The flag wide characters and their meanings are:

XSI `'`	The integer portion of the result of a decimal conversion (`%i`, `%d`, `%u`, `%f`, `%F`, `%g`, or `%G`) shall be formatted with thousands' grouping wide characters. For other conversions, the behavior is undefined. The numeric grouping wide character is used.
−	The result of the conversion shall be left-justified within the field. The conversion shall be right-justified if this flag is not specified.
+	The result of a signed conversion shall always begin with a sign (`'+'` or `'−'`). The conversion shall begin with a sign only when a negative value is converted if this flag is not specified.
<space>	If the first wide character of a signed conversion is not a sign, or if a signed conversion results in no wide characters, a <space> shall be prefixed to the result. This means that if the <space> and `'+'` flags both appear, the <space> flag shall be ignored.
#	Specifies that the value is to be converted to an alternative form. For `o` conversion, it increases the precision (if necessary) to force the first digit of the result to be 0. For `x` or `X` conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For `a`, `A`, `e`, `E`, `f`, `F`, `g`, and `G` conversion specifiers, the result shall always contain a radix character, even if no digits follow it. Without this flag, a radix character appears in the result of these conversions only if a digit follows it. For `g` and `G` conversion specifiers, trailing zeros shall *not* be removed from the result as they normally are. For other conversion

specifiers, the behavior is undefined.

`0` For `d`, `i`, `o`, `u`, `x`, `X`, `a`, `A`, `e`, `E`, `f`, `F`, `g`, and `G` conversion specifiers, leading zeros (following any indication of sign or base) are used to pad to the field width; no space padding is performed. If the `'0'` and `'−'` flags both appear, the `'0'` flag shall be ignored. For `d`, `i`, `o`, `u`, `x`, and `X` conversion specifiers, if a precision is specified, the `'0'` flag shall be ignored. If the `'0'` and `'\''` flags both appear, the grouping wide characters are inserted before zero padding. For other conversions, the behavior is undefined.

The length modifiers and their meanings are:

`hh` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **signed char** or **unsigned char** argument (the argument will have been promoted according to the integer promotions, but its value shall be converted to **signed char** or **unsigned char** before printing); or that a following `n` conversion specifier applies to a pointer to a **signed char** argument.

`h` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **short** or **unsigned short** argument (the argument will have been promoted according to the integer promotions, but its value shall be converted to **short** or **unsigned short** before printing); or that a following `n` conversion specifier applies to a pointer to a **short** argument.

`l` (ell) Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **long** or **unsigned long** argument; that a following `n` conversion specifier applies to a pointer to a **long** argument; that a following `c` conversion specifier applies to a **wint_t** argument; that a following `s` conversion specifier applies to a pointer to a **wchar_t** argument; or has no effect on a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier.

`ll` (ell-ell)

Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **long long** or **unsigned long long** argument; or that a following `n` conversion specifier applies to a pointer to a **long long** argument.

`j` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to an **intmax_t** or **uintmax_t** argument; or that a following `n` conversion specifier applies to a pointer to an **intmax_t** argument.

`z` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **size_t** or the corresponding signed integer type argument; or that a following `n` conversion specifier applies to a pointer to a signed integer type corresponding to **size_t** argument.

`t` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **ptrdiff_t** or the corresponding **unsigned** type argument; or that a following `n` conversion specifier applies to a pointer to a **ptrdiff_t** argument.

`L` Specifies that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier applies to a **long double** argument.

If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.

The conversion specifiers and their meanings are:

`d`, `i` The **int** argument shall be converted to a signed decimal in the style `"[−]`*`dddd`*`"`. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.

`o` The **unsigned** argument shall be converted to unsigned octal format in the style `"dddd"`. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.

`u` The **unsigned** argument shall be converted to unsigned decimal format in the style `"dddd"`. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.

`x` The **unsigned** argument shall be converted to unsigned hexadecimal format in the style `"dddd"`; the letters `"abcdef"` are used. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.

`X` Equivalent to the `x` conversion specifier, except that letters `"ABCDEF"` are used instead of `"abcdef"`.

`f`, `F` The **double** argument shall be converted to decimal notation in the style `"[−]`*`ddd.ddd`*`"`, where the number of digits after the radix character shall be equal to the precision specification. If the precision is missing, it shall be taken as 6; if the precision is explicitly zero and no `'#'` flag is present, no radix character shall appear. If a radix character appears, at least one digit shall appear before it. The value shall be rounded in an implementation-defined manner to the appropriate number of digits.

A **double** argument representing an infinity shall be converted in one of the styles `"[−]inf"` or `"[−]infinity"`; which style is implementation-defined. A **double** argument representing a NaN shall be converted in one of the styles `"[−]nan"` or `"[−]nan(`*`n-char-sequence`*`)"`; which style, and the meaning of any *n-char-sequence*, is implementation-defined. The `F` conversion specifier produces `"INF"`, `"INFINITY"`, or `"NAN"` instead of `"inf"`, `"infinity"`, or `"nan"`, respectively.

e, *E* The **double** argument shall be converted in the style `"[−]`*`d.ddd`*e±`dd"`, where there shall be one digit before the radix character (which is non-zero if the argument is non-zero) and the number of digits after it shall be equal to the precision; if the precision is missing, it shall be taken as 6; if the precision is zero and no `'#'` flag is present, no radix character shall appear. The value shall be rounded in an implementation-defined manner to the appropriate number of digits. The `E` conversion wide character shall produce a number with `'E'` instead of `'e'` introducing the exponent. The exponent always shall contain at least two digits. If the value is zero, the exponent shall be zero.

A **double** argument representing an infinity or NaN shall be converted in the style of an `f` or `F` conversion specifier.

`g`, `G` The **double** argument shall be converted in the style `f` or `e` (or in the style `F` or `E` in the case of a `G` conversion specifier), with the precision specifying the number of significant digits. If an explicit precision is zero, it shall be taken as 1. The style used depends on the value converted; style `e` (or `E`) shall be used only if the exponent resulting from such a conversion is less than −4 or greater than or equal to the precision. Trailing zeros shall be removed from the fractional portion of the result; a radix character shall appear only if it is followed by a digit.

A **double** argument representing an infinity or NaN shall be converted in the style of an `f` or `F` conversion specifier.

`a`, `A` A **double** argument representing a floating-point number shlal be converted in the style `"[−]0xh.hhhhp±d"`, where there shall be one hexadecimal digit (which is non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point wide character and the number of hexadecimal digits after it shall be equal to the precision; if the precision is missing and FLT_RADIX is a power of 2, then the precision shall be sufficient for an exact representation of the value; if the precision is missing and FLT_RADIX is not a power of 2, then the precision shall be sufficient to distinguish values of type **double**, except that trailing zeros may be omitted; if the precision is zero and the `'#'` flag is not specified, no decimal-point wide character shall appear. The letters `"abcdef"` are used for `a` conversion and the letters `"ABCDEF"` for `A` conversion. The `A` conversion specifier produces a number with `'X'` and `'P'` instead of `'x'` and `'p'`. The exponent shall always contain at least one digit, and only as many more digits as necessary to represent the decimal exponent of 2. If the value is zero, the exponent shall be zero.

A **double** argument representing an infinity or NaN shall be converted in the style of an `f` or `F` conversion specifier.

`c` If no `l` (ell) qualifier is present, the **int** argument shall be converted to a wide character as if by calling the *btowc*( ) function and the resulting wide character shall be written. Otherwise, the **wint_t** argument shall be converted to **wchar_t**, and written.

`s` If no `l` (ell) qualifier is present, the application shall ensure that the argument is a pointer to a character array containing a character sequence beginning in the initial shift state. Characters from the array shall be converted as if by repeated calls to the *mbrtowc*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first character is converted, and written up to (but not including) the terminating null wide character. If the precision is specified, no more than that many wide characters shall be written. If the precision is not specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character.

If an `l` (ell) qualifier is present, the application shall ensure that the argument is a pointer to an array of type **wchar_t**. Wide characters from the array shall be written up to (but not including) a terminating null wide character. If no precision is specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many wide characters shall be written.

`p` The application shall ensure that the argument is a pointer to **void**. The value of the pointer shall be converted to a sequence of printable wide characters in an implementation-defined manner.

`n` The application shall ensure that the argument is a pointer to an integer into which is written the number of wide characters written to the output so far by this call to one of the *fwprintf*( ) functions. No argument shall be converted, but one shall be consumed. If the conversion specification includes any flags, a field width, or a precision, the behavior is undefined.

XSI `C` Equivalent to `lc`.

XSI `S` Equivalent to `ls`.

`%` Output a `'%'` wide character; no argument shall be converted. The entire conversion specification shall be `%%`.

If a conversion specification does not match one of the above forms, the behavior is undefined.

In no case does a nonexistent or small field width cause truncation of a field; if the result of a conversion is wider than the field width, the field shall be expanded to contain the conversion result. Characters generated by *fwprintf*( ) and *wprintf*( ) shall be printed as if *fputwc*( ) had been called.

For `a` and `A` conversions, if FLT_RADIX is not a power of 2 and the result is not exactly representable in the given precision, the result should be one of the two adjacent numbers in hexadecimal floating style with the given precision, with the extra stipulation that the error should have a correct sign for the current rounding direction.

For `e`, `E`, `f`, `F`, `g`, and `G` conversion specifiers, if the number of significant decimal digits is at most DECIMAL_DIG, then the result should be correctly rounded. If the number of significant decimal digits is more than DECIMAL_DIG but the source value is exactly representable with DECIMAL_DIG digits, then the result should be an exact representation with trailing zeros. Otherwise, the source value is bounded by two adjacent decimal strings $L < U$, both having DECIMAL_DIG significant digits; the value of the resultant decimal string D should satisfy $L <= D <= U$, with the extra stipulation that the error should have a correct sign for the current rounding direction.

CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the call to a successful execution of *fwprintf*( ) or *wprintf*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream, or a call to *exit*( ) or *abort*( ).

RETURN VALUE

Upon successful completion, these functions shall return the number of wide characters transmitted, excluding the terminating null wide character in the case of *swprintf*( ), or a negative value if an output error was encountered, CX and set *errno* to indicate the error.

If *n* or more wide characters were requested to be written, *swprintf*( ) shall return a negative value, CX and set *errno* to indicate the error.

ERRORS

For the conditions under which *fwprintf*( ) and *wprintf*( ) fail and may fail, refer to *fputwc*( ).

In addition, all forms of *fwprintf*( ) may fail if:

XSI [EILSEQ] A wide-character code that does not correspond to a valid character has been detected.

XSI [EINVAL] There are insufficient arguments.

In addition, *wprintf*( ) and *fwprintf*( ) may fail if:

XSI [ENOMEM] Insufficient storage space is available.

EXAMPLES

To print the language-independent date and time format, the following statement could be used:

```
wprintf(format, weekday, month, day, hour, min);
```

For American usage, *format* could be a pointer to the wide-character string:

```
L"%s, %s %d, %d:%.2d\n"
```

producing the message:

```
Sunday, July 3, 10:02
```

whereas for German usage, *format* could be a pointer to the wide-character string:

```
L"%1$s, %3$d. %2$s, %4$d:%5$.2d\n"
```

producing the message:

```
Sonntag, 3. Juli, 10:02
```

APPLICATION USAGE

None.

RATIONALE

CHANGE HISTORY

First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

The Open Group Corrigendum U040/1 is applied to the RETURN VALUE section, describing the case if *n* or more wide characters are requested to be written using *swprintf*( ).

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototypes for *fwprintf*( ), *swprintf*( ), and *wprintf*( ) are updated.
- The DESCRIPTION is updated.
- The `hh`, `ll`, `j`, `t`, and `z` length modifiers are added.
- The `a`, `A`, and `F` conversion characters are added.
- XSI shading is removed from the description of character string representations of infinity and NaN floating-point values.

The DESCRIPTION is updated to use the terms ‘‘conversion specifier’’ and ‘‘conversion specification’’ consistently.

ISO/IEC 9899:1999 standard, Technical Corrigendum No. 1 is incorporated.

NAME

fwrite — binary output

SYNOPSIS

```
#include <stdio.h>

size_t fwrite(const void *restrict ptr, size_t size, size_t nitems,
    FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fwrite*( ) function shall write, from the array pointed to by *ptr*, up to *nitems* elements whose size is specified by *size*, to the stream pointed to by *stream*. For each object, *size* calls shall be made to the *fputc*( ) function, taking the values (in order) from an array of **unsigned char** exactly overlaying the object. The file-position indicator for the stream (if defined) shall be advanced by the number of bytes successfully written. If an error occurs, the resulting value of the file-position indicator for the stream is unspecified.

CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful execution of *fwrite*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream, or a call to *exit*( ) or *abort*( ).

RETURN VALUE

The *fwrite*( ) function shall return the number of elements successfully written, which may be less than *nitems* if a write error is encountered. If *size* or *nitems* is 0, *fwrite*( ) shall return 0 and the state of the stream remains unchanged. Otherwise, if a write error occurs, the error indicator for the stream shall be set, CX and *errno* shall be set to indicate the error.

ERRORS

Refer to *fputc*( ).

EXAMPLES

None.

APPLICATION USAGE

Because of possible differences in element length and byte ordering, files written using *fwrite*( ) are application-dependent, and possibly cannot be read using *fread*( ) by a different application or by the same application on a different processor.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are now marked.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The *fwrite*( ) prototype is updated.
- The DESCRIPTION is updated to clarify how the data is written out using *fputc*( ).

NAME

fwscanf, swscanf, wscanf — convert formatted wide-character input

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

int fwscanf(FILE *restrict stream, const wchar_t *restrict format, ... );
int swscanf(const wchar_t *restrict ws,
    const wchar_t *restrict format, ... );
int wscanf(const wchar_t *restrict format, ... );
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *fwscanf*( ) function shall read from the named input *stream*. The *wscanf*( ) function shall read from the standard input stream *stdin*. The *swscanf*( ) function shall read from the wide-character string *ws*. Each function reads wide characters, interprets them according to a format, and stores the results in its arguments. Each expects, as arguments, a control wide-character string *format* described below, and a set of *pointer* arguments indicating where the converted input should be stored. The result is undefined if there are insufficient arguments for the format. If the format is exhausted while arguments remain, the excess arguments are evaluated but are otherwise ignored. |

XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than to the next unused argument. In this case, the conversion specifier wide character % (see below) is replaced by the sequence `"%n$"`, where *n* is a decimal integer in the range [1,{NL_ARGMAX}]. This feature provides for the definition of format wide-character strings that select arguments in an order appropriate to specific languages. In format wide-character strings containing the `"%`*n*`$"` form of conversion specifications, it is unspecified whether numbered arguments in the argument list can be referenced from the format wide-character string more than once.

The *format* can contain either form of a conversion specification—that is, % or `"%`*n*`$"`— but the two forms cannot normally be mixed within a single *format* wide-character string. The only exception to this is that `%%` or `%*` can be mixed with the `"%`*n*`$"` form. When numbered argument specifications are used, specifying the *N*th argument requires that all the leading arguments, from the first to the (*N*−1)th, are pointers. |

CX The *fwscanf*( ) function in all its forms allows for detection of a language-dependent radix character in the input string, encoded as a wide-character value. The radix character is defined in the program's locale (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a period (`'.'`).

The *format* is a wide-character string composed of zero or more directives. Each directive is composed of one of the following: one or more white-space wide characters (<space>s, <tab>s, <newline>s, <vertical-tab>s, or <form-feed>s); an ordinary wide character (neither `'%'` nor a white-space character); or a conversion specification. Each conversion specification is introduced by a `'%'` XSI or the sequence `"%`*n*`$"` after which the following appear in sequence:

- An optional assignment-suppressing character `'*'`.
- An optional non-zero decimal integer that specifies the maximum field width.
- An optional length modifier that specifies the size of the receiving object.

- A conversion specifier wide character that specifies the type of conversion to be applied. The valid conversion specifiers are described below.

The *fwscanf*( ) functions shall execute each directive of the format in turn. If a directive fails, as detailed below, the function shall return. Failures are described as input failures (due to the unavailability of input bytes) or matching failures (due to inappropriate input).

A directive composed of one or more white-space wide characters is executed by reading input until no more valid input can be read, or up to the first wide character which is not a white-space wide character, which remains unread.

A directive that is an ordinary wide character shall be executed as follows. The next wide character is read from the input and compared with the wide character that comprises the directive; if the comparison shows that they are not equivalent, the directive shall fail, and the differing and subsequent wide characters remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a wide character from being read, the directive shall fail.

A directive that is a conversion specification defines a set of matching input sequences, as described below for each conversion wide character. A conversion specification is executed in the following steps.

Input white-space wide characters (as specified by *iswspace*( )) shall be skipped, unless the conversion specification includes a `[`, `c`, or `n` conversion specifier.

An item shall be read from the input, unless the conversion specification includes an `n` conversion specifier wide character. An input item is defined as the longest sequence of input wide characters, not exceeding any specified field width, which is an initial subsequence of a matching sequence. The first wide character, if any, after the input item shall remain unread. If the length of the input item is zero, the execution of the conversion specification shall fail; this condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is an input failure.

Except in the case of a `%` conversion specifier, the input item (or, in the case of a `%n` conversion specification, the count of input wide characters) shall be converted to a type appropriate to the conversion wide character. If the input item is not a matching sequence, the execution of the conversion specification shall fail; this condition is a matching failure. Unless assignment suppression was indicated by a `'*'`, the result of the conversion shall be placed in the object pointed to by the first argument following the *format* argument that has not already received a conversion result if the conversion specification is introduced by `%`, XSI or in the *n*th argument if introduced by the wide-character sequence `"%`*n*`$"`. If this object does not have an appropriate type, or if the result of the conversion cannot be represented in the space provided, the behavior is undefined.

The length modifiers and their meanings are:

`hh`	Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **signed char** or **unsigned char**.
`h`	Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **short** or **unsigned short**.
`l` (ell)	Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **long** or **unsigned long**; that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier applies to an argument with type pointer to **double**; or that a following `c`, `s`, or `[` conversion specifier applies to an argument with type pointer to **wchar_t**.

`ll` (ell-ell)

Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **long long** or **unsigned long long**.

`j` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **intmax_t** or **uintmax_t**.

`z` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **size_t** or the corresponding signed integer type.

`t` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **ptrdiff_t** or the corresponding **unsigned** type.

`L` Specifies that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier applies to an argument with type pointer to **long double**.

If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.

The following conversion specifier wide characters are valid:

`d` Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of *wcstol*( ) with the value 10 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **int**.

`i` Matches an optionally signed integer, whose format is the same as expected for the subject sequence of *wcstol*( ) with 0 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **int**.

`o` Matches an optionally signed octal integer, whose format is the same as expected for the subject sequence of *wcstoul*( ) with the value 8 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

`u` Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of *wcstoul*( ) with the value 10 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

`x` Matches an optionally signed hexadecimal integer, whose format is the same as expected for the subject sequence of *wcstoul*( ) with the value 16 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

`a`, `e`, `f`, `g`

Matches an optionally signed floating-point number, infinity, or NaN whose format is the same as expected for the subject sequence of *wcstod*( ). In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **float**.

If the *fwprintf*( ) family of functions generates character string representations for infinity and NaN (a symbolic entity encoded in floating-point format) to support IEEE Std 754-1985, the *fwscanf*( ) family of functions shall recognize them as input.

`s` Matches a sequence of non white-space wide characters. If no `l` (ell) qualifier is present, characters from the input field shall be converted as if by repeated calls to the *wcrtomb*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first wide character is converted. The application shall ensure that the corresponding argument is a pointer to a character array large enough to accept the sequence and the terminating null character, which shall be added automatically.

Otherwise, the application shall ensure that the corresponding argument is a pointer to an array of **wchar_t** large enough to accept the sequence and the terminating null wide character, which shall be added automatically.

`[` Matches a non-empty sequence of wide characters from a set of expected wide characters (the *scanset*). If no `l` (ell) qualifier is present, wide characters from the input field shall be converted as if by repeated calls to the *wcrtomb*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first wide character is converted. The application shall ensure that the corresponding argument is a pointer to a character array large enough to accept the sequence and the terminating null character, which shall be added automatically.

If an `l` (ell) qualifier is present, the application shall ensure that the corresponding argument is a pointer to an array of **wchar_t** large enough to accept the sequence and the terminating null wide character, which shall be added automatically.

The conversion specification includes all subsequent wide characters in the *format* string up to and including the matching right square bracket (`']'`). The wide characters between the square brackets (the *scanlist*) comprise the scanset, unless the wide character after the left square bracket is a circumflex (`'^'`), in which case the scanset contains all wide characters that do not appear in the scanlist between the circumflex and the right square bracket. If the conversion specification begins with `"[]"` or `"[^]"`, the right square bracket is included in the scanlist and the next right square bracket is the matching right square bracket that ends the conversion specification; otherwise, the first right square bracket is the one that ends the conversion specification. If a `'−'` is in the scanlist and is not the first wide character, nor the second where the first wide character is a `'^'`, nor the last wide character, the behavior is implementation-defined.

`c` Matches a sequence of wide characters of exactly the number specified by the field width (1 if no field width is present in the conversion specification).

If no `l` (ell) length modifier is present, characters from the input field shall be converted as if by repeated calls to the *wcrtomb*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first wide character is converted. The corresponding argument shall be a pointer to the initial element of a character array large enough to accept the sequence. No null character is added.

If an `l` (ell) length modifier is present, the corresponding argument shall be a pointer to the initial element of an array of **wchar_t** large enough to accept the sequence. No null wide character is added.

Otherwise, the application shall ensure that the corresponding argument is a pointer to an array of **wchar_t** large enough to accept the sequence. No null wide character is added.

`p` Matches an implementation-defined set of sequences, which shall be the same as the set of sequences that is produced by the `%p` conversion specification of the corresponding *fwprintf*( ) functions. The application shall ensure that the corresponding argument is a pointer to a pointer to **void**. The interpretation of the input item is implementation-defined. If the input item is a value converted earlier during the same program execution, the pointer that results shall compare equal to that value; otherwise, the behavior of the %p conversion is undefined.

n No input is consumed. The application shall ensure that the corresponding argument is a pointer to the integer into which is to be written the number of wide characters read from the input so far by this call to the *fwscanf*( ) functions. Execution of a %n conversion specification shall not increment the assignment count returned at the completion of execution of the function. No argument shall be converted, but one shall be consumed. If the conversion specification includes an assignment-suppressing wide character or a field width, the behavior is undefined. |

XSI C Equivalent to lc. |

XSI S Equivalent to ls. |

% Matches a single '%' wide character; no conversion or assignment shall occur. The complete conversion specification shall be %%. |

If a conversion specification is invalid, the behavior is undefined.

The conversion specifiers A, E, F, G, and X are also valid and shall be equivalent to, respectively, a, e, f, g, and x. |

If end-of-file is encountered during input, conversion is terminated. If end-of-file occurs before any wide characters matching the current conversion specification (except for %n) have been read (other than leading white-space, where permitted), execution of the current conversion specification shall terminate with an input failure. Otherwise, unless execution of the current conversion specification is terminated with a matching failure, execution of the following conversion specification (if any) shall be terminated with an input failure. |

Reaching the end of the string in *swscanf*( ) shall be equivalent to encountering end-of-file for *fwscanf*( ). |

If conversion terminates on a conflicting input, the offending input shall be left unread in the input. Any trailing white space (including <newline>) shall be left unread unless matched by a conversion specification. The success of literal matches and suppressed assignments is only directly determinable via the %n conversion specification. |

CX The *fwscanf*( ) and *wscanf*( ) functions may mark the *st_atime* field of the file associated with *stream* for update. The *st_atime* field shall be marked for update by the first successful execution of *fgetc*( ), *fgetwc*( ), *fgets*( ), *fgetws*( ), *fread*( ), *getc*( ), *getwc*( ), *getchar*( ), *getwchar*( ), *gets*( ), *fscanf*( ), or *fwscanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ).

RETURN VALUE

Upon successful completion, these functions shall return the number of successfully matched and assigned input items; this number can be zero in the event of an early matching failure. If the input ends before the first matching failure or conversion, EOF shall be returned. If a read error occurs the error indicator for the stream is set, EOF shall be returned, CX and *errno* shall be set to indicate the error.

ERRORS

For the conditions under which the *fwscanf*( ) functions shall fail and may fail, refer to *fgetwc*( ).

In addition, *fwscanf*( ) may fail if:

XSI [EILSEQ]	Input byte sequence does not form a valid character.
XSI [EINVAL]	There are insufficient arguments.

EXAMPLES

The call:

```
int i, n; float x; char name[50];
n = wscanf(L"%d%f%s", &i, &x, name);
```

with the input line:

```
25 54.32E−1 Hamster
```

assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string `"Hamster"`.

The call:

```
int i; float x; char name[50];
(void) wscanf(L"%2d%f%*d %[0123456789]", &i, &x, name);
```

with input:

```
56789 0123 56a72
```

assigns 56 to *i*, 789.0 to *x*, skip 0123, and place the string `"56\0"` in *name*. The next call to *getchar*( ) shall return the character `'a'`.

APPLICATION USAGE

In format strings containing the `'%'` form of conversion specifications, each argument in the argument list is used exactly once.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototypes for *fwscanf*( ) and *swscanf*( ) are updated.
- The DESCRIPTION is updated. |
- The `hh`, `ll`, `j`, `t`, and `z` length modifiers are added. |
- The `a`, `A`, and `F` conversion characters are added. |

The DESCRIPTION is updated to use the terms ‘‘conversion specifier’’ and ‘‘conversion specification’’ consistently.

NAME

gai_strerror — address and name information error description

SYNOPSIS

```
#include <netdb.h>

const char *gai_strerror(int ecode);
```

DESCRIPTION

The *gai_strerror*( ) function shall return a text string describing an error value for the *getaddrinfo*( ) and *getnameinfo*( ) functions listed in the **<netdb.h>** header.

When the *ecode* argument is one of the following values listed in the **<netdb.h>** header:

[EAI_AGAIN]
[EAI_BADFLAGS]
[EAI_FAIL]
[EAI_FAMILY]
[EAI_MEMORY]
[EAI_NONAME]
[EAI_SERVICE]
[EAI_SOCKTYPE]
[EAI_SYSTEM]

the function return value shall point to a string describing the error. If the argument is not one of those values, the function shall return a pointer to a string whose contents indicate an unknown error.

RETURN VALUE

Upon successful completion, *gai_strerror*( ) shall return a pointer to an implementation-defined string.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

getaddrinfo( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<netdb.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The Open Group Base Resolution bwg2001-009 is applied, which changes the return type from **char *** to **const char ***. This is for coordination with the IPnG Working Group.

NAME

gcvt — convert a floating-point number to a string (**LEGACY**)

SYNOPSIS

XSI

```
#include <stdlib.h>

char *gcvt(double value, int ndigit, char *buf);
```

DESCRIPTION

Refer to *ecvt*( ).

NAME

getaddrinfo — get address information

SYNOPSIS

```
#include <sys/socket.h>
#include <netdb.h>

int getaddrinfo(const char *restrict nodename,
    const char *restrict servname,
    const struct addrinfo *restrict hints,
    struct addrinfo **restrict res);
```

DESCRIPTION

Refer to *freeaddrinfo*( ).

NAME

getc — get a byte from a stream

SYNOPSIS

```
#include <stdio.h>

int getc(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *getc*( ) function shall be equivalent to *fgetc*( ), except that if it is implemented as a macro it may evaluate *stream* more than once, so the argument should never be an expression with side effects.

RETURN VALUE

Refer to *fgetc*( ).

ERRORS

Refer to *fgetc*( ).

EXAMPLES

None.

APPLICATION USAGE

If the integer value returned by *getc*( ) is stored into a variable of type **char** and then compared against the integer constant EOF, the comparison may never succeed, because sign-extension of a variable of type **char** on widening to integer is implementation-defined.

Since it may be implemented as a macro, *getc*( ) may treat incorrectly a *stream* argument with side effects. In particular, *getc*(**f*++) does not necessarily work as expected. Therefore, use of this function should be preceded by `"#undef getc"` in such situations; *fgetc*( ) could also be used. |

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

NAME

getc_unlocked, getchar_unlocked, putc_unlocked, putchar_unlocked — stdio with explicit client locking

SYNOPSIS

TSF

```
#include <stdio.h>

int getc_unlocked(FILE *stream);
int getchar_unlocked(void);
int putc_unlocked(int c, FILE *stream);
int putchar_unlocked(int c);
```

DESCRIPTION

Versions of the functions *getc*( ), *getchar*( ), *putc*( ), and *putchar*( ) respectively named *getc_unlocked*( ), *getchar_unlocked*( ), *putc_unlocked*( ), and *putchar_unlocked*( ) shall be provided which are functionally equivalent to the original versions, with the exception that they are not required to be implemented in a thread-safe manner. They may only safely be used within a scope protected by *flockfile*( ) (or *ftrylockfile*( )) and *funlockfile*( ). These functions may safely be used in a multi-threaded program if and only if they are called while the invoking thread owns the (**FILE ***) object, as is the case after a successful call of the *flockfile*( ) or *ftrylockfile*( ) functions.

RETURN VALUE

See *getc*( ), *getchar*( ), *putc*( ), and *putchar*( ).

ERRORS

See *getc*( ), *getchar*( ), *putc*( ), and *putchar*( ).

EXAMPLES

None.

APPLICATION USAGE

Since they may be implemented as macros, *getc_unlocked*( ) and *putc_unlocked*( ) may treat incorrectly a stream argument with side effects. In particular, *getc_unlocked*(*f++) and *putc_unlocked*(*f++) do not necessarily work as expected. Therefore, use of these functions in such situations should be preceded by the following statement as appropriate:

```
#undef getc_unlocked
#undef putc_unlocked
```

RATIONALE

Some I/O functions are typically implemented as macros for performance reasons (for example, *putc*( ) and *getc*( )). For safety, they need to be synchronized, but it is often too expensive to synchronize on every character. Nevertheless, it was felt that the safety concerns were more important; consequently, the *getc*( ), *getchar*( ), *putc*( ), and *putchar*( ) functions are required to be thread-safe. However, unlocked versions are also provided with names that clearly indicate the unsafe nature of their operation but can be used to exploit their higher performance. These unlocked versions can be safely used only within explicitly locked program regions, using exported locking primitives. In particular, a sequence such as:

```
flockfile(fileptr);
putc_unlocked('1', fileptr);
putc_unlocked('\n', fileptr);
fprintf(fileptr, "Line 2\n");
funlockfile(fileptr);
```

is permissible, and results in the text sequence:

```
1
Line 2
```

being printed without being interspersed with output from other threads.

It would be wrong to have the standard names such as *getc*( ), *putc*( ), and so on, map to the ‘‘faster, but unsafe’’ rather than the ‘‘slower, but safe’’ versions. In either case, you would still want to inspect all uses of *getc*( ), *putc*( ), and so on, by hand when converting existing code. Choosing the safe bindings as the default, at least, results in correct code and maintains the ‘‘atomicity at the function’’ invariant. To do otherwise would introduce gratuitous synchronization errors into converted code. Other routines that modify the *stdio* (**FILE ***) structures or buffers are also safely synchronized.

Note that there is no need for functions of the form *getc_locked*( ), *putc_locked*( ), and so on, since this is the functionality of *getc*( ), *putc*( ), *et al*. It would be inappropriate to use a feature test macro to switch a macro definition of *getc*( ) between *getc_locked*( ) and *getc_unlocked*( ), since the ISO C standard requires an actual function to exist, a function whose behavior could not be changed by the feature test macro. Also, providing both the *xxx_locked*( ) and *xxx_unlocked*( ) forms leads to the confusion of whether the suffix describes the behavior of the function or the circumstances under which it should be used.

Three additional routines, *flockfile*( ), *ftrylockfile*( ), and *funlockfile*( ) (which may be macros), are provided to allow the user to delineate a sequence of I/O statements that are executed synchronously.

The *ungetc*( ) function is infrequently called relative to the other functions/macros so no unlocked variation is needed.

FUTURE DIRECTIONS

None.

getc( ), *getchar*( ), *putc*( ), *putchar*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

These functions are marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U030/2 is applied, adding APPLICATION USAGE describing how applications should be written to avoid the case when the functions are implemented as macros.

NAME

getchar — get a byte from a stdin stream

SYNOPSIS

```
#include <stdio.h>

int getchar(void);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *getchar*( ) function shall be equivalent to *getc*(*stdin*).

RETURN VALUE

Refer to *fgetc*( ).

ERRORS

Refer to *fgetc*( ).

EXAMPLES

None.

APPLICATION USAGE

If the integer value returned by *getchar*( ) is stored into a variable of type **char** and then compared against the integer constant EOF, the comparison may never succeed, because sign-extension of a variable of type **char** on widening to integer is implementation-defined.

RATIONALE

None.

FUTURE DIRECTIONS

NAME

getchar_unlocked — stdio with explicit client locking

SYNOPSIS

TSF

```
#include <stdio.h>

int getchar_unlocked(void);

```

DESCRIPTION

Refer to *getc_unlocked*( ).

NAME

getcontext, setcontext — get and set current user context

SYNOPSIS

XSI
```
#include <ucontext.h>

int getcontext(ucontext_t *ucp);
int setcontext(const ucontext_t *ucp);
```

DESCRIPTION

The *getcontext*( ) function shall initialize the structure pointed to by *ucp* to the current user context of the calling thread. The **ucontext_t** type that *ucp* points to defines the user context and includes the contents of the calling thread's machine registers, the signal mask, and the current execution stack.

The *setcontext*( ) function shall restore the user context pointed to by *ucp*. A successful call to *setcontext*( ) shall not return; program execution resumes at the point specified by the *ucp* argument passed to *setcontext*( ). The *ucp* argument should be created either by a prior call to *getcontext*( ) or *makecontext*( ), or by being passed as an argument to a signal handler. If the *ucp* argument was created with *getcontext*( ), program execution continues as if the corresponding call of *getcontext*( ) had just returned. If the *ucp* argument was created with *makecontext*( ), program execution continues with the function passed to *makecontext*( ). When that function returns, the thread shall continue as if after a call to *setcontext*( ) with the *ucp* argument that was input to *makecontext*( ). If the *uc_link* member of the **ucontext_t** structure pointed to by the *ucp* argument is equal to 0, then this context is the main context, and the thread shall exit when this context returns. The effects of passing a *ucp* argument obtained from any other source are unspecified.

RETURN VALUE

Upon successful completion, *setcontext*( ) shall not return and *getcontext*( ) shall return 0; otherwise, a value of –1 shall be returned.

ERRORS

No errors are defined.

EXAMPLES

Refer to *makecontext*( ).

APPLICATION USAGE

When a signal handler is executed, the current user context is saved and a new context is created. If the thread leaves the signal handler via *longjmp*( ), then it is unspecified whether the context at the time of the corresponding *setjmp*( ) call is restored and thus whether future calls to *getcontext*( ) provide an accurate representation of the current context, since the context restored by *longjmp*( ) does not necessarily contain all the information that *setcontext*( ) requires. Signal handlers should use *siglongjmp*( ) or *setcontext*( ) instead.

Conforming applications should not modify or access the *uc_mcontext* member of **ucontext_t**. A conforming application cannot assume that context includes any process-wide static data, possibly including *errno*. Users manipulating contexts should take care to handle these explicitly when required.

Use of contexts to create alternate stacks is not defined by this volume of IEEE Std 1003.1-200x.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

bsd_signal( ), *makecontext*( ), *setjmp*( ), *sigaction*( ), *sigaltstack*( ), *sigprocmask*( ), *sigsetjmp*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<ucontext.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The following sentence was removed from the DESCRIPTION: ‘‘If the *ucp* argument was passed to a signal handler, program execution continues with the program instruction following the instruction interrupted by the signal.’’

NAME

getcwd — get the pathname of the current working directory

SYNOPSIS

```
#include <unistd.h>

char *getcwd(char *buf, size_t size);
```

DESCRIPTION

The *getcwd*( ) function shall place an absolute pathname of the current working directory in the array pointed to by *buf*, and return *buf*. The pathname copied to the array shall contain no components that are symbolic links. The *size* argument is the size in bytes of the character array pointed to by the *buf* argument. If *buf* is a null pointer, the behavior of *getcwd*( ) is unspecified.

RETURN VALUE

Upon successful completion, *getcwd*( ) shall return the *buf* argument. Otherwise, *getcwd*( ) shall return a null pointer and set *errno* to indicate the error. The contents of the array pointed to by *buf* are then undefined.

ERRORS

The *getcwd*( ) function shall fail if:

[EINVAL]	The *size* argument is 0.
[ERANGE]	The size argument is greater than 0, but is smaller than the length of the pathname +1.

The *getcwd*( ) function may fail if:

[EACCES]	Read or search permission was denied for a component of the pathname.
[ENOMEM]	Insufficient storage space is available.

EXAMPLES

Determining the Absolute Pathname of the Current Working Directory

The following example returns a pointer to an array that holds the absolute pathname of the current working directory. The pointer is returned in the *ptr* variable, which points to the *buf* array where the pathname is stored.

```
#include <stdlib.h>
#include <unistd.h>
...
long size;
char *buf;
char *ptr;

size = pathconf(".", _PC_PATH_MAX);

if ((buf = (char *)malloc((size_t)size)) != NULL)
    ptr = getcwd(buf, (size_t)size);
...
```

APPLICATION USAGE

None.

RATIONALE

Since the maximum pathname length is arbitrary unless {PATH_MAX} is defined, an application generally cannot supply a *buf* with *size* {{PATH_MAX}+1}.

Having *getcwd*( ) take no arguments and instead use the *malloc*( ) function to produce space for the returned argument was considered. The advantage is that *getcwd*( ) knows how big the working directory pathname is and can allocate an appropriate amount of space. But the programmer would have to use the *free*( ) function to free the resulting object, or each use of *getcwd*( ) would further reduce the available memory. Also, *malloc*( ) and *free*( ) are used nowhere else in this volume of IEEE Std 1003.1-200x. Finally, *getcwd*( ) is taken from the SVID where it has the two arguments used in this volume of IEEE Std 1003.1-200x.

The older function *getwd*( ) was rejected for use in this context because it had only a buffer argument and no *size* argument, and thus had no way to prevent overwriting the buffer, except to depend on the programmer to provide a large enough buffer.

On some implementations, if *buf* is a null pointer, *getcwd*( ) may obtain *size* bytes of memory using *malloc*( ). In this case, the pointer returned by *getcwd*( ) may be used as the argument in a subsequent call to *free*( ). Invoking *getcwd*( ) with *buf* as a null pointer is not recommended in conforming applications.

If a program is operating in a directory where some (grand)parent directory does not permit reading, *getcwd*( ) may fail, as in most implementations it must read the directory to determine the name of the file. This can occur if search, but not read, permission is granted in an intermediate directory, or if the program is placed in that directory by some more privileged process (for example, login). Including the [EACCES] error condition makes the reporting of the error consistent and warns the application writer that *getcwd*( ) can fail for reasons beyond the control of the application writer or user. Some implementations can avoid this occurrence (for example, by implementing *getcwd*( ) using *pwd*, where *pwd* is a set-user-root process), thus the error was made optional. Since this volume of IEEE Std 1003.1-200x permits the addition of other errors, this would be a common addition and yet one that applications could not be expected to deal with without this addition.

FUTURE DIRECTIONS

None.

malloc( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ENOMEM] optional error condition is added.

NAME

getdate — convert user format date and time

SYNOPSIS

XSI

```
#include <time.h>

struct tm *getdate(const char *string);
```

DESCRIPTION

The *getdate*( ) function shall convert a string representation of a date or time into a broken-down time.

The external variable or macro *getdate_err* is used by *getdate*( ) to return error values.

Templates are used to parse and interpret the input string. The templates are contained in a text file identified by the environment variable *DATEMSK*. The *DATEMSK* variable should be set to indicate the full pathname of the file that contains the templates. The first line in the template that matches the input specification is used for interpretation and conversion into the internal time format.

The following conversion specifications shall be supported:

`%%`	Equivalent to `%`.
`%a`	Abbreviated weekday name.
`%A`	Full weekday name.
`%b`	Abbreviated month name.
`%B`	Full month name.
`%c`	Locale's appropriate date and time representation.
`%C`	Century number [00,99]; leading zeros are permitted but not required.
`%d`	Day of month [01,31]; the leading 0 is optional.
`%D`	Date as `%m`/`%d`/`%y`.
`%e`	Equivalent to `%d`.
`%h`	Abbreviated month name.
`%H`	Hour [00,23].
`%I`	Hour [01,12].
`%m`	Month number [01,12].
`%M`	Minute [00,59].
`%n`	Equivalent to <newline>.
`%p`	Locale's equivalent of either AM or PM.
`%r`	The locale's appropriate representation of time in AM and PM notation. In the POSIX locale, this shall be equivalent to `%I:%M:%S %p`.
`%R`	Time as `%H:%M`.
`%S`	Seconds [00,60]. The range goes to 60 (rather than stopping at 59) to allow positive leap seconds to be expressed. Since leap seconds cannot be predicted by any algorithm, leap second data must come from some external source.

`%t`	Equivalent to <tab>.
`%T`	Time as `%H:%M:%S`.
`%w`	Weekday number (Sunday = [0,6]).
`%x`	Locale's appropriate date representation.
`%X`	Locale's appropriate time representation.
`%y`	Year within century. When a century is not otherwise specified, values in the range [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive. **Note:** It is expected that in a future version of IEEE Std 1003.1-200x the default century inferred from a 2-digit year will change. (This would apply to all commands accepting a 2-digit year as input.)
`%Y`	Year as `"ccyy"` (for example, 2001).
`%Z`	Timezone name or no characters if no timezone exists. If the timezone supplied by `%Z` is not the timezone that *getdate*( ) expects, an invalid input specification error shall result. The *getdate*( ) function calculates an expected timezone based on information supplied to the function (such as the hour, day, and month).

The match between the template and input specification performed by *getdate*( ) shall be case-insensitive.

The month and weekday names can consist of any combination of upper and lowercase letters. The process can request that the input date or time specification be in a specific language by setting the *LC_TIME* category (see *setlocale*( )).

Leading 0s are not necessary for the descriptors that allow leading 0s. However, at most two digits are allowed for those descriptors, including leading 0s. Extra whitespace in either the template file or in *string* shall be ignored.

The results are undefined if the conversion specifications `%c`, `%x`, and `%X` include unsupported conversion specifications.

The following rules apply for converting the input specification into the internal format:

- If `%Z` is being scanned, then *getdate*( ) shall initialize the broken-down time to be the current time in the scanned timezone. Otherwise, it shall initialize the broken-down time based on the current local time as if *localtime*( ) had been called.
- If only the weekday is given, the day chosen shall be the day, starting with today and moving into the future, which first matches the named day.
- If only the month (and no year) is given, the month chosen shall be the month, starting with the current month and moving into the future, which first matches the named month. The first day of the month shall be assumed if no day is given.
- If no hour, minute, and second are given the current hour, minute, and second shall be assumed.
- If no date is given, the hour chosen shall be the hour, starting with the current hour and moving into the future, which first matches the named hour.

If a conversion specification in the DATEMSK file does not correspond to one of the conversion specifications above, the behavior is unspecified.

The *getdate*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *getdate*( ) shall return a pointer to a **struct tm**. Otherwise, it shall return a null pointer and set *getdate_err* to indicate the error.

ERRORS

The *getdate*( ) function shall fail in the following cases, setting *getdate_err* to the value shown in the list below. Any changes to *errno* are unspecified.

1. The *DATEMSK* environment variable is null or undefined.
2. The template file cannot be opened for reading.
3. Failed to get file status information.
4. The template file is not a regular file.
5. An I/O error is encountered while reading the template file.
6. Memory allocation failed (not enough memory available).
7. There is no line in the template that matches the input.
8. Invalid input specification. For example, February 31; or a time is specified that cannot be represented in a **time_t** (representing the time in seconds since the Epoch).

EXAMPLES

1. The following example shows the possible contents of a template:

```
%m
%A %B %d, %Y, %H:%M:%S
%A
%B
%m/%d/%y %I %p
%d,%m,%Y %H:%M
at %A the %dst of %B in %Y
run job at %I %p,%B %dnd
%A den %d. %B %Y %H.%M Uhr
```

2. The following are examples of valid input specifications for the template in Example 1:

```
getdate("10/1/87 4 PM");
getdate("Friday");
getdate("Friday September 18, 1987, 10:30:30");
getdate("24,9,1986 10:30");
getdate("at monday the 1st of december in 1986");
getdate("run job at 3 PM, december 2nd");
```

If the *LC_TIME* category is set to a German locale that includes *freitag* as a weekday name and *oktober* as a month name, the following would be valid:

```
getdate("freitag den 10. oktober 1986 10.30 Uhr");
```

3. The following example shows how local date and time specification can be defined in the template:

Invocation	Line in Template
`getdate("11/27/86")`	`%m/%d/%y`
`getdate("27.11.86")`	`%d.%m.%y`
`getdate("86-11-27")`	`%y-%m-%d`
`getdate("Friday 12:00:00")`	`%A %H:%M:%S`

4. The following examples help to illustrate the above rules assuming that the current date is Mon Sep 22 12:19:47 EDT 1986 and the *LC_TIME* category is set to the default C locale:

Input	Line in Template	Date
`Mon`	`%a`	Mon Sep 22 12:19:47 EDT 1986
`Sun`	`%a`	Sun Sep 28 12:19:47 EDT 1986
`Fri`	`%a`	Fri Sep 26 12:19:47 EDT 1986
`September`	`%B`	Mon Sep 1 12:19:47 EDT 1986
`January`	`%B`	Thu Jan 1 12:19:47 EST 1987
`December`	`%B`	Mon Dec 1 12:19:47 EST 1986
`Sep Mon`	`%b %a`	Mon Sep 1 12:19:47 EDT 1986
`Jan Fri`	`%b %a`	Fri Jan 2 12:19:47 EST 1987
`Dec Mon`	`%b %a`	Mon Dec 1 12:19:47 EST 1986
`Jan Wed 1989`	`%b %a %Y`	Wed Jan 4 12:19:47 EST 1989
`Fri 9`	`%a %H`	Fri Sep 26 09:00:00 EDT 1986
`Feb 10:30`	`%b %H:%S`	Sun Feb 1 10:00:30 EST 1987
`10:30`	`%H:%M`	Tue Sep 23 10:30:00 EDT 1986
`13:30`	`%H:%M`	Mon Sep 22 13:30:00 EDT 1986

APPLICATION USAGE

Although historical versions of *getdate*( ) did not require that **<time.h>** declare the external variable *getdate_err*, this volume of IEEE Std 1003.1-200x does require it. The standard developers encourage applications to remove declarations of *getdate_err* and instead incorporate the declaration by including **<time.h>**. |

Applications should use `%Y` (4-digit years) in preference to `%y` (2-digit years).

RATIONALE

In standard locales, the conversion specifications `%c`, `%x`, and `%X` do not include unsupported conversion specifiers and so the text regarding results being undefined is not a problem in that case. |

FUTURE DIRECTIONS

None.

SEE ALSO

ctime( ), *localtime*( ), *setlocale*( ), *strftime*( ), *times*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<time.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The last paragraph of the DESCRIPTION is added.

The `%C` conversion specification is added, and the exact meaning of the `%y` conversion specification is clarified in the DESCRIPTION.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

The `%R` conversion specifications is changed to follow historical practice.

Issue 6

The DESCRIPTION is updated to refer to ‘‘seconds since the Epoch’’ rather than ‘‘seconds since 00:00:00 UTC (Coordinated Universal Time), January 1 1970’’ for consistency with other *time* functions.

The description of `%S` is updated so that the valid range [00,60] rather than [00,61]. |

The DESCRIPTION is updated to refer to conversion specifications instead of field descriptors for consistency with other functions. |

NAME

getegid — get the effective group ID

SYNOPSIS

```
#include <unistd.h>

gid_t getegid(void);
```

DESCRIPTION

The *getegid*( ) function shall return the effective group ID of the calling process.

RETURN VALUE

The *getegid*( ) function shall always be successful and no return value is reserved to indicate an error. |

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

NAME

getenv — get value of an environment variable

SYNOPSIS

```
#include <stdlib.h>

char *getenv(const char *name);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *getenv*( ) function shall search the environment of the calling process (see the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 8, Environment Variables) for the environment variable *name* if it exists and return a pointer to the value of the environment variable. If the specified environment variable cannot be found, a null pointer shall be returned. The application shall ensure that it does not modify the string pointed to by the *getenv*( ) function.

CX The string pointed to may be overwritten by a subsequent call to *getenv*( ), *setenv*( ), or *unsetenv*( ), but shall not be overwritten by a call to any other function in this volume of IEEE Std 1003.1-200x.

CX If the application modifies *environ* or the pointers to which it points, the behavior of *getenv*( ) is undefined. |

The *getenv*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *getenv*( ) shall return a pointer to a string containing the *value* for the specified *name*. If the specified name cannot be found in the environment of the calling process, a null pointer shall be returned.

The return value from *getenv*( ) may point to static data which may be overwritten by CX subsequent calls to *getenv*( ), *setenv*( ), or *unsetenv*( ).

XSI On XSI-conformant systems, the return value from *getenv*( ) may point to static data which may also be overwritten by subsequent calls to *putenv*( ).

ERRORS

No errors are defined.

EXAMPLES

Getting the Value of an Environment Variable

The following example gets the value of the *HOME* environment variable.

```
#include <stdlib.h>
...
const char *name = "HOME";
char *value;

value = getenv(name);
```

APPLICATION USAGE

None.

RATIONALE

The *clearenv*( ) function was considered but rejected. The *putenv*( ) function has now been included for alignment with the Single UNIX Specification.

The *getenv*( ) function is inherently not reentrant because it returns a value pointing to static data.

Conforming applications are required not to modify *environ* directly, but to use only the functions described here to manipulate the process environment as an abstract object. Thus, the implementation of the environment access functions has complete control over the data structure used to represent the environment (subject to the requirement that *environ* be maintained as a list of strings with embedded equal signs for applications that wish to scan the environment). This constraint allows the implementation to properly manage the memory it allocates, either by using allocated storage for all variables (copying them on the first invocation of *setenv*( ) or *unsetenv*( )), or keeping track of which strings are currently in allocated space and which are not, via a separate table or some other means. This enables the implementation to free any allocated space used by strings (and perhaps the pointers to them) stored in *environ* when *unsetenv*( ) is called. A C runtime start-up procedure (that which invokes *main*( ) and perhaps initializes *environ*) can also initialize a flag indicating that none of the environment has yet been copied to allocated storage, or that the separate table has not yet been initialized.

In fact, for higher performance of *getenv*( ), the implementation could also maintain a separate copy of the environment in a data structure that could be searched much more quickly (such as an indexed hash table, or a binary tree), and update both it and the linear list at *environ* when *setenv*( ) or *unsetenv*( ) is invoked.

Performance of *getenv*( ) can be important for applications which have large numbers of environment variables. Typically, applications like this use the environment as a resource | database of user-configurable parameters. The fact that these variables are in the user's shell | environmentt usually means that any other program that uses environment variables (such as *ls*, which attempts to use *COLUMNS*, or really almost any utility (*LANG*, *LC_ALL*, and so on) is similarly slowed down by the linear search through the variables.

An implementation that maintains separate data structures, or even one that manages the memory it consumes, is not currently required as it was thought it would reduce consensus among implementors who do not want to change their historical implementations.

The POSIX Threads Extension states that multi-threaded applications must not modify *environ* directly, and that IEEE Std 1003.1-200x is providing functions which such applications can use in the future to manipulate the environment in a thread-safe manner. Thus, moving away from application use of *environ* is desirable from that standpoint as well.

FUTURE DIRECTIONS

None.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

NAME

getgrent — get the group database entry

SYNOPSIS

XSI

```
#include <grp.h>

struct group *getgrent(void);
```

DESCRIPTION

Refer to *endgrent*( ).

NAME

getgrgid, getgrgid_r — get group database entry for a group ID

SYNOPSIS

```
#include <grp.h>

struct group *getgrgid(gid_t gid);
int getgrgid_r(gid_t gid, struct group *grp, char *buffer,
    size_t bufsize, struct group **result);
```

TSF

DESCRIPTION

The *getgrgid*( ) function shall search the group database for an entry with a matching *gid*.

The *getgrgid*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

TSF The *getgrgid_r*( ) function shall update the **group** structure pointed to by *grp* and store a pointer to that structure at the location pointed to by *result*. The structure shall contain an entry from the group database with a matching *gid*. Storage referenced by the group structure is allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. The maximum size needed for this buffer can be determined with the {_SC_GETGR_R_SIZE_MAX} *sysconf*( ) parameter. A NULL pointer shall be returned at the location pointed to by *result* on error or if the requested entry is not found.

RETURN VALUE

Upon successful completion, *getgrgid*( ) shall return a pointer to a **struct group** with the structure defined in **<grp.h>** with a matching entry if one is found. The *getgrgid*( ) function shall return a null pointer if either the requested entry was not found, or an error occurred. On error, *errno* shall be set to indicate the error.

The return value may point to a static area which is overwritten by a subsequent call to *getgrent*( ), *getgrgid*( ), or *getgrnam*( ).

TSF If successful, the *getgrgid_r*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *getgrgid*( ) and *getgrgid_r*( ) functions may fail if:

[EIO]	An I/O error has occurred.
[EINTR]	A signal was caught during *getgrgid*( ).
[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
[ENFILE]	The maximum allowable number of files is currently open in the system.

TSF The *getgrgid_r*( ) function may fail if:

[ERANGE]	Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be referenced by the resulting **group** structure.

EXAMPLES

Finding an Entry in the Group Database

The following example uses *getgrgid*( ) to search the group database for a group ID that was previously stored in a **stat** structure, then prints out the group name if it is found. If the group is not found, the program prints the numeric value of the group for the entry.

```
#include <sys/types.h>
#include <grp.h>
#include <stdio.h>
...
struct stat statbuf;
struct group *grp;
...
if ((grp = getgrgid(statbuf.st_gid)) != NULL)
    printf(" %-8.8s", grp->gr_name);
else
    printf(" %-8d", statbuf.st_gid);
...
```

APPLICATION USAGE

Applications wishing to check for error situations should set *errno* to 0 before calling *getgrgid*( ). If *errno* is set on return, an error occurred.

The *getgrgid_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

endgrent( ), *getgrnam*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<grp.h>**, **<limits.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getgrgid_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getgrgid*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getgrgid_r*( ) function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the *gid*.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

NAME

getgrnam, getgrnam_r — search group database for a name

SYNOPSIS

```
#include <grp.h>

struct group *getgrnam(const char *name);
int getgrnam_r(const char *name, struct group *grp, char *buffer,
    size_t bufsize, struct group **result);
```

TSF (applies to `getgrnam_r`)

DESCRIPTION

The *getgrnam*( ) function shall search the group database for an entry with a matching *name*.

The *getgrnam*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

TSF The *getgrnam_r*( ) function shall update the **group** structure pointed to by *grp* and store a pointer to that structure at the location pointed to by *result*. The structure shall contain an entry from the group database with a matching *gid* or *name*. Storage referenced by the group structure is allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. The maximum size needed for this buffer can be determined with the {_SC_GETGR_R_SIZE_MAX} *sysconf*( ) parameter. A NULL pointer is returned at the location pointed to by *result* on error or if the requested entry is not found.

RETURN VALUE

The *getgrnam*( ) function shall return a pointer to a **struct group** with the structure defined in **<grp.h>** with a matching entry if one is found. The *getgrnam*( ) function shall return a null pointer if either the requested entry was not found, or an error occurred. On error, *errno* shall be set to indicate the error.

The return value may point to a static area which is overwritten by a subsequent call to *getgrent*( ), *getgrgid*( ), or *getgrnam*( ).

TSF If successful, the *getgrnam_r*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *getgrnam*( ) and *getgrnam_r*( ) functions may fail if:

[EIO]	An I/O error has occurred.
[EINTR]	A signal was caught during *getgrnam*( ).
[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
[ENFILE]	The maximum allowable number of files is currently open in the system.

The *getgrnam_r*( ) function may fail if:

TSF [ERANGE]	Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be referenced by the resulting **group** structure.

EXAMPLES

None.

APPLICATION USAGE

Applications wishing to check for error situations should set *errno* to 0 before calling *getgrnam*( ). If *errno* is set on return, an error occurred.

The *getgrnam_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

endgrent( ), *getgrgid*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<grp.h>**, **<limits.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getgrnam_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getgrnam*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getgrnam_r*( ) function is marked as part of the Thread-Safe Functions option.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

NAME

getgroups — get supplementary group IDs

SYNOPSIS

```
#include <unistd.h>

int getgroups(int gidsetsize, gid_t grouplist[]);
```

DESCRIPTION

The *getgroups*( ) function shall fill in the array *grouplist* with the current supplementary group IDs of the calling process. It is implementation-defined whether *getgroups*( ) also returns the effective group ID in the *grouplist* array. |

The *gidsetsize* argument specifies the number of elements in the array *grouplist*. The actual number of group IDs stored in the array shall be returned. The values of array entries with indices greater than or equal to the value returned are undefined. |

If *gidsetsize* is 0, *getgroups*( ) shall return the number of group IDs that it would otherwise return without modifying the array pointed to by *grouplist*.

If the effective group ID of the process is returned with the supplementary group IDs, the value returned shall always be greater than or equal to one and less than or equal to the value of {NGROUPS_MAX}+1.

RETURN VALUE

Upon successful completion, the number of supplementary group IDs shall be returned. A return value of –1 indicates failure and *errno* shall be set to indicate the error.

ERRORS

The *getgroups*( ) function shall fail if:

[EINVAL]	The *gidsetsize* argument is non-zero and less than the number of group IDs that would have been returned.

EXAMPLES

Getting the Supplementary Group IDs of the Calling Process

The following example places the current supplementary group IDs of the calling process into the *group* array.

```
#include <sys/types.h>
#include <unistd.h>
...
gid_t *group;
int nogroups;
long ngroups_max;

ngroups_max = sysconf(_SC_NGROUPS_MAX) + 1;
group = (gid_t *)malloc(ngroups_max *sizeof(gid_t));

ngroups = getgroups(ngroups_max, group);
```

APPLICATION USAGE

None.

RATIONALE

The related function *setgroups*( ) is a privileged operation and therefore is not covered by this volume of IEEE Std 1003.1-200x.

As implied by the definition of supplementary groups, the effective group ID may appear in the array returned by *getgroups*( ) or it may be returned only by *getegid*( ). Duplication may exist, but the application needs to call *getegid*( ) to be sure of getting all of the information. Various implementation variations and administrative sequences cause the set of groups appearing in the result of *getgroups*( ) to vary in order and as to whether the effective group ID is included, even when the set of groups is the same (in the mathematical sense of ‘‘set’’). (The history of a process and its parents could affect the details of result.)

Applications writers should note that {NGROUPS_MAX} is not necessarily a constant on all implementations.

FUTURE DIRECTIONS

None.

SEE ALSO

getegid( ), *setgid*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 3.

Entry included for alignment with the POSIX.1-1988 standard.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

- A return value of 0 is not permitted, because {NGROUPS_MAX} cannot be 0. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Explanation added that the effective group ID may be included in the supplementary group list.

NAME

gethostbyaddr, gethostbyname — network host database functions

SYNOPSIS

```
#include <netdb.h>
```

OB

```
struct hostent *gethostbyaddr(const void *addr, socklen_t len,
       int type);
struct hostent *gethostbyname(const char *name);
```

DESCRIPTION

These functions shall retrieve information about hosts. This information is considered to be stored in a database that can be accessed sequentially or randomly. Implementation of this database is unspecified.

Note: In many cases it is implemented by the Domain Name System, as documented in RFC 1034, RFC 1035, and RFC 1886.

Entries shall be returned in **hostent** structures.

The *gethostbyaddr*( ) function shall return an entry containing addresses of address family *type* for the host with address *addr*. The *len* argument contains the length of the address pointed to by *addr*. The *gethostbyaddr*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

The *gethostbyname*( ) function shall return an entry containing addresses of address family AF_INET for the host with name *name*. The *gethostbyname*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

The *addr* argument of *gethostbyaddr*( ) shall be an **in_addr** structure when *type* is AF_INET. It contains a binary format (that is, not null-terminated) address in network byte order. The *gethostbyaddr*( ) function is not guaranteed to return addresses of address families other than AF_INET, even when such addresses exist in the database.

If *gethostbyaddr*( ) returns successfully, then the *h_addrtype* field in the result shall be the same as the *type* argument that was passed to the function, and the *h_addr_list* field shall list a single address that is a copy of the *addr* argument that was passed to the function.

The *name* argument of *gethostbyname*( ) shall be a node name; the behavior of *gethostbyname*( ) when passed a numeric address string is unspecified. For IPv4, a numeric address string shall be in the dotted-decimal notation described in *inet_addr*( ).

If *name* is not a numeric address string and is an alias for a valid host name, then *gethostbyname*( ) shall return information about the host name to which the alias refers, and *name* shall be included in the list of aliases returned.

RETURN VALUE

Upon successful completion, these functions shall return a pointer to a **hostent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found.

Upon unsuccessful completion, *gethostbyaddr*( ) and *gethostbyname*( ) shall set *h_errno* to indicate the error.

ERRORS

These functions shall fail in the following cases. The *gethostbyaddr*( ) and *gethostbyname*( ) functions shall set *h_errno* to the value shown in the list below. Any changes to *errno* are unspecified.

[HOST_NOT_FOUND]	No such host is known.
[NO_DATA]	The server recognized the request and the name, but no address is available. Another type of request to the name server for the domain might return an answer.
[NO_RECOVERY]	An unexpected server failure occurred which cannot be recovered.
[TRY_AGAIN]	A temporary and possibly transient error occurred, such as a failure of a server to respond.

EXAMPLES

None.

APPLICATION USAGE

The *gethostbyaddr*( ) and *gethostbyname*( ) functions may return pointers to static data, which may be overwritten by subsequent calls to any of these functions.

The *getaddrinfo*( ) and *getnameinfo*( ) functions are preferred over the *gethostbyaddr*( ) and *gethostbyname*( ) functions.

RATIONALE

None.

FUTURE DIRECTIONS

The *gethostbyaddr*( ) and *gethostbyname*( ) functions may be withdrawn in a future version.

NAME

gethostname — get name of current host

SYNOPSIS

```
#include <unistd.h>

int gethostname(char *name, size_t namelen);
```

DESCRIPTION

The *gethostname*( ) function shall return the standard host name for the current machine. The *namelen* argument shall specify the size of the array pointed to by the *name* argument. The returned name shall be null-terminated, except that if *namelen* is an insufficient length to hold the host name, then the returned name shall be truncated and it is unspecified whether the returned name is null-terminated.

Host names are limited to {HOST_NAME_MAX} bytes.

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, –1 shall be returned.

ERRORS

No errors are defined.

The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter from **socklen_t** to **size_t**.

NAME

getitimer, setitimer — get and set value of interval timer

SYNOPSIS

XSI

```
#include <sys/time.h>

int getitimer(int which, struct itimerval *value);
int setitimer(int which, const struct itimerval *restrict value,
    struct itimerval *restrict ovalue);

```

DESCRIPTION

The *getitimer*( ) function shall store the current value of the timer specified by *which* into the structure pointed to by *value*. The *setitimer*( ) function shall set the timer specified by *which* to the value specified in the structure pointed to by *value*, and if *ovalue* is not a null pointer, stores the previous value of the timer in the structure pointed to by *ovalue*.

A timer value is defined by the **itimerval** structure, specified in **<sys/time.h>**. If *it_value* is non-zero, it shall indicate the time to the next timer expiration. If *it_interval* is non-zero, it shall specify a value to be used in reloading *it_value* when the timer expires. Setting *it_value* to 0 shall disable a timer, regardless of the value of *it_interval*. Setting *it_interval* to 0 shall disable a timer after its next expiration (assuming *it_value* is non-zero).

Implementations may place limitations on the granularity of timer values. For each interval timer, if the requested timer value requires a finer granularity than the implementation supports, the actual timer value shall be rounded up to the next supported value.

An XSI-conforming implementation provides each process with at least three interval timers, which are indicated by the *which* argument:

ITIMER_REAL	Decrements in real time. A SIGALRM signal is delivered when this timer expires.
ITIMER_VIRTUAL	Decrements in process virtual time. It runs only when the process is executing. A SIGVTALRM signal is delivered when it expires.
ITIMER_PROF	Decrements both in process virtual time and when the system is running on behalf of the process. It is designed to be used by interpreters in statistically profiling the execution of interpreted programs. Each time the ITIMER_PROF timer expires, the SIGPROF signal is delivered.

The interaction between *setitimer*( ) and any of *alarm*( ), *sleep*( ), or *usleep*( ) is unspecified.

RETURN VALUE

Upon successful completion, *getitimer*( ) or *setitimer*( ) shall return 0; otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *setitimer*( ) function shall fail if:

[EINVAL]	The *value* argument is not in canonical form. (In canonical form, the number of microseconds is a non-negative integer less than 1,000,000 and the number of seconds is a non-negative integer.)

The *getitimer*( ) and *setitimer*( ) functions may fail if:

[EINVAL]	The *which* argument is not recognized.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

alarm( ), *sleep*( ), *timer_getoverrun*( ), *ualarm*( ), *usleep*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<signal.h>**, **<sys/time.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X / OPEN UNIX extension to BASE.

Issue 6

The **restrict** keyword is added to the *setitimer*( ) prototype for alignment with the ISO / IEC 9899: 1999 standard.

NAME

getlogin, getlogin_r — get login name

SYNOPSIS

```
#include <unistd.h>

char *getlogin(void);
```

TSF
```
int getlogin_r(char *name, size_t namesize);
```

DESCRIPTION

The *getlogin*( ) function shall return a pointer to a string containing the user name associated by the login activity with the controlling terminal of the current process. If *getlogin*( ) returns a non-null pointer, then that pointer points to the name that the user logged in under, even if there are several login names with the same user ID.

The *getlogin*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

TSF The *getlogin_r*( ) function shall put the name associated by the login activity with the controlling terminal of the current process in the character array pointed to by *name*. The array is *namesize* characters long and should have space for the name and the terminating null character. The maximum size of the login name is {LOGIN_NAME_MAX}. |

If *getlogin_r*( ) is successful, *name* points to the name the user used at login, even if there are several login names with the same user ID.

RETURN VALUE

Upon successful completion, *getlogin*( ) shall return a pointer to the login name or a null pointer if the user's login name cannot be found. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

The return value from *getlogin*( ) may point to static data whose content is overwritten by each call.

TSF If successful, the *getlogin_r*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *getlogin*( ) and *getlogin_r*( ) functions may fail if:

[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
[ENFILE]	The maximum allowable number of files is currently open in the system.
[ENXIO]	The calling process has no controlling terminal.

The *getlogin_r*( ) function may fail if:

TSF [ERANGE]	The value of *namesize* is smaller than the length of the string to be returned including the terminating null character.

EXAMPLES

Getting the User Login Name

The following example calls the *getlogin*( ) function to obtain the name of the user associated with the calling process, and passes this information to the *getpwnam*( ) function to get the associated user database information.

```
#include <unistd.h>
#include <sys/types.h>
#include <pwd.h>
#include <stdio.h>
...
char *lgn;
struct passwd *pw;
...
if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
    fprintf(stderr, "Get of user information failed.\n"); exit(1);
    }
```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid*(*geteuid*( )) shall return the name associated with the effective user ID of the process; *getlogin*( ) shall return the name associated with the current login activity; and *getpwuid*(*getuid*( )) shall return the name associated with the real user ID of the process.

The *getlogin_r*( ) function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

The *getlogin*( ) function returns a pointer to the user's login name. The same user ID may be shared by several login names. If it is desired to get the user database entry that is used during login, the result of *getlogin*( ) should be used to provide the argument to the *getpwnam*( ) function. (This might be used to determine the user's login shell, particularly where a single user has multiple login shells with distinct login names, but the same user ID.)

The information provided by the *cuserid*( ) function, which was originally defined in the POSIX.1-1988 standard and subsequently removed, can be obtained by the following:

```
getpwuid(geteuid())
```

while the information provided by historical implementations of *cuserid*( ) can be obtained by:

```
getpwuid(getuid())
```

The thread-safe version of this function places the user name in a user-supplied buffer and returns a non-zero value if it fails. The non-thread-safe version may return the name in a static data area that may be overwritten by each call.

FUTURE DIRECTIONS

None.

SEE ALSO

getpwnam( ), *getpwuid*( ), *geteuid*( ), *getuid*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<limits.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getlogin_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getlogin*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getlogin_r*( ) function is marked as part of the Thread-Safe Functions option.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

NAME

getmsg, getpmsg — receive next message from a STREAMS file (**STREAMS**)

SYNOPSIS

XSR

```
#include <stropts.h>

int getmsg(int fildes, struct strbuf *restrict ctlptr,
    struct strbuf *restrict dataptr, int *restrict flagsp);
int getpmsg(int fildes, struct strbuf *restrict ctlptr,
    struct strbuf *restrict dataptr, int *restrict bandp,
    int *restrict flagsp);
```

DESCRIPTION

The *getmsg*( ) function shall retrieve the contents of a message located at the head of the STREAM head read queue associated with a STREAMS file and place the contents into one or more buffers. The message contains either a data part, a control part, or both. The data and control parts of the message shall be placed into separate buffers, as described below. The semantics of each part are defined by the originator of the message.

The *getpmsg*( ) function shall be equivalent to *getmsg*( ), except that it provides finer control over the priority of the messages received. Except where noted, all requirements on *getmsg*( ) also pertain to *getpmsg*( ).

The *fildes* argument specifies a file descriptor referencing a STREAMS-based file.

The *ctlptr* and *dataptr* arguments each point to a **strbuf** structure, in which the *buf* member points to a buffer in which the data or control information is to be placed, and the *maxlen* member indicates the maximum number of bytes this buffer can hold. On return, the *len* member shall contain the number of bytes of data or control information actually received. The *len* member shall be set to 0 if there is a zero-length control or data part and *len* shall be set to −1 if no data or control information is present in the message.

When *getmsg*( ) is called, *flagsp* should point to an integer that indicates the type of message the process is able to receive. This is described further below.

The *ctlptr* argument is used to hold the control part of the message, and *dataptr* is used to hold the data part of the message. If *ctlptr* (or *dataptr*) is a null pointer or the *maxlen* member is −1, the control (or data) part of the message shall not be processed and shall be left on the STREAM head read queue, and if the *ctlptr* (or *dataptr*) is not a null pointer, *len* shall be set to −1. If the *maxlen* member is set to 0 and there is a zero-length control (or data) part, that zero-length part shall be removed from the read queue and *len* shall be set to 0. If the *maxlen* member is set to 0 and there are more than 0 bytes of control (or data) information, that information shall be left on the read queue and *len* shall be set to 0. If the *maxlen* member in *ctlptr* (or *dataptr*) is less than the control (or data) part of the message, *maxlen* bytes shall be retrieved. In this case, the remainder of the message shall be left on the STREAM head read queue and a non-zero return value shall be provided.

By default, *getmsg*( ) shall process the first available message on the STREAM head read queue. However, a process may choose to retrieve only high-priority messages by setting the integer pointed to by *flagsp* to RS_HIPRI. In this case, *getmsg*( ) shall only process the next message if it is a high-priority message. When the integer pointed to by *flagsp* is 0, any available message shall be retrieved. In this case, on return, the integer pointed to by *flagsp* shall be set to RS_HIPRI if a high-priority message was retrieved, or 0 otherwise.

For *getpmsg*( ), the flags are different. The *flagsp* argument points to a bitmask with the following mutually-exclusive flags defined: MSG_HIPRI, MSG_BAND, and MSG_ANY. Like *getmsg*( ), *getpmsg*( ) shall process the first available message on the STREAM head read queue. A process may choose to retrieve only high-priority messages by setting the integer pointed to by *flagsp* to MSG_HIPRI and the integer pointed to by *bandp* to 0. In this case, *getpmsg*( ) shall only process the next message if it is a high-priority message. In a similar manner, a process may choose to retrieve a message from a particular priority band by setting the integer pointed to by *flagsp* to MSG_BAND and the integer pointed to by *bandp* to the priority band of interest. In this case, *getpmsg*( ) shall only process the next message if it is in a priority band equal to, or greater than, the integer pointed to by *bandp*, or if it is a high-priority message. If a process wants to get the first message off the queue, the integer pointed to by *flagsp* should be set to MSG_ANY and the integer pointed to by *bandp* should be set to 0. On return, if the message retrieved was a high-priority message, the integer pointed to by *flagsp* shall be set to MSG_HIPRI and the integer pointed to by *bandp* shall be set to 0. Otherwise, the integer pointed to by *flagsp* shall be set to MSG_BAND and the integer pointed to by *bandp* shall be set to the priority band of the message.

If O_NONBLOCK is not set, *getmsg*( ) and *getpmsg*( ) shall block until a message of the type specified by *flagsp* is available at the front of the STREAM head read queue. If O_NONBLOCK is set and a message of the specified type is not present at the front of the read queue, *getmsg*( ) and *getpmsg*( ) shall fail and set *errno* to [EAGAIN].

If a hangup occurs on the STREAM from which messages are retrieved, *getmsg*( ) and *getpmsg*( ) shall continue to operate normally, as described above, until the STREAM head read queue is empty. Thereafter, they shall return 0 in the *len* members of *ctlptr* and *dataptr*.

RETURN VALUE

Upon successful completion, *getmsg*( ) and *getpmsg*( ) shall return a non-negative value. A value of 0 indicates that a full message was read successfully. A return value of MORECTL indicates that more control information is waiting for retrieval. A return value of MOREDATA indicates that more data is waiting for retrieval. A return value of the bitwise-logical OR of MORECTL and MOREDATA indicates that both types of information remain. Subsequent *getmsg*( ) and *getpmsg*( ) calls shall retrieve the remainder of the message. However, if a message of higher priority has come in on the STREAM head read queue, the next call to *getmsg*( ) or *getpmsg*( ) shall retrieve that higher-priority message before retrieving the remainder of the previous message.

If the high priority control part of the message is consumed, the message shall be placed back on the queue as a normal message of band 0. Subsequent *getmsg*( ) and *getpmsg*( ) calls shall retrieve the remainder of the message. If, however, a priority message arrives or already exists on the STREAM head, the subsequent call to *getmsg*( ) or *getpmsg*( ) shall retrieve the higher-priority message before retrieving the remainder of the message that was put back.

Upon failure, *getmsg*( ) and *getpmsg*( ) shall return −1 and set *errno* to indicate the error.

ERRORS

The *getmsg*( ) and *getpmsg*( ) functions shall fail if:

[EAGAIN]	The O_NONBLOCK flag is set and no messages are available.
[EBADF]	The *fildes* argument is not a valid file descriptor open for reading.
[EBADMSG]	The queued message to be read is not valid for *getmsg*( ) or *getpmsg*( ) or a pending file descriptor is at the STREAM head.
[EINTR]	A signal was caught during *getmsg*( ) or *getpmsg*( ).
[EINVAL]	An illegal value was specified by *flagsp*, or the STREAM or multiplexer referenced by *fildes* is linked (directly or indirectly) downstream from a multiplexer.

[ENOSTR] A STREAM is not associated with *fildes*.

In addition, *getmsg*( ) and *getpmsg*( ) shall fail if the STREAM head had processed an asynchronous error before the call. In this case, the value of *errno* does not reflect the result of *getmsg*( ) or *getpmsg*( ) but reflects the prior error.

EXAMPLES

Getting Any Message

In the following example, the value of *fd* is assumed to refer to an open STREAMS file. The call to *getmsg*( ) retrieves any available message on the associated STREAM-head read queue, returning control and data information to the buffers pointed to by *ctrlbuf* and *databuf*, respectively.

```
#include <stropts.h>
...
int fd;
char ctrlbuf[128];
char databuf[512];
struct strbuf ctrl;
struct strbuf data;
int flags = 0;
int ret;

ctrl.buf = ctrlbuf;
ctrl.maxlen = sizeof(ctrlbuf);

data.buf = databuf;
data.maxlen = sizeof(databuf);

ret = getmsg (fd, &ctrl, &data, &flags);
```

Getting the First Message off the Queue

In the following example, the call to *getpmsg*( ) retrieves the first available message on the associated STREAM-head read queue.

```
#include <stropts.h>
...

int fd;
char ctrlbuf[128];
char databuf[512];
struct strbuf ctrl;
struct strbuf data;
int band = 0;
int flags = MSG_ANY;
int ret;

ctrl.buf = ctrlbuf;
ctrl.maxlen = sizeof(ctrlbuf);

data.buf = databuf;
data.maxlen = sizeof(databuf);

ret = getpmsg (fd, &ctrl, &data, &band, &flags);
```

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

A paragraph regarding ‘‘high-priority control parts of messages’’ is added to the RETURN VALUE section.

Issue 6

This function is marked as part of the XSI STREAMS Option Group.

The **restrict** keyword is added to the *getmsg*( ) and *getpmsg*( ) prototypes for alignment with the ISO/IEC 9899:1999 standard.

NAME

getnameinfo — get name information

SYNOPSIS

```
#include <sys/socket.h>
#include <netdb.h>

int getnameinfo(const struct sockaddr *restrict sa, socklen_t salen,
    char *restrict node, socklen_t nodelen, char *restrict service,
    socklen_t servicelen, unsigned flags);
```

DESCRIPTION

The *getnameinfo*( ) function shall translate a socket address to a node name and service location, all of which are defined as in *getaddrinfo*( ).

The *sa* argument points to a socket address structure to be translated.

If the *node* argument is non-NULL and the *nodelen* argument is non-zero, then the *node* argument points to a buffer able to contain up to *nodelen* characters that receives the node name as a null-terminated string. If the *node* argument is NULL or the *nodelen* argument is zero, the node name shall not be returned. If the node's name cannot be located, the numeric form of the node's address is returned instead of its name.

If the *service* argument is non-NULL and the *servicelen* argument is non-zero, then the *service* argument points to a buffer able to contain up to *servicelen* bytes that receives the service name as a null-terminated string. If the *service* argument is NULL or the *servicelen* argument is zero, the service name shall not be returned. If the service's name cannot be located, the numeric form of the service address (for example, its port number) shall be returned instead of its name.

The *flags* argument is a flag that changes the default actions of the function. By default the fully-qualified domain name (FQDN) for the host shall be returned, but:

- If the flag bit NI_NOFQDN is set, only the node name portion of the FQDN shall be returned for local hosts.
- If the flag bit NI_NUMERICHOST is set, the numeric form of the host's address shall be returned instead of its name, under all circumstances.
- If the flag bit NI_NAMEREQD is set, an error shall be returned if the host's name cannot be located.
- If the flag bit NI_NUMERICSERV is set, the numeric form of the service address shall be returned (for example, its port number) instead of its name, under all circumstances.
- If the flag bit NI_DGRAM is set, this indicates that the service is a datagram service (SOCK_DGRAM). The default behavior shall assume that the service is a stream service (SOCK_STREAM).

Notes:

1. The two NI_NUMERICxxx flags are required to support the **−n** flag that many commands provide.
2. The NI_DGRAM flag is required for the few AF_INET and AF_INET6 port numbers (for example, [512,514]) that represent different services for UDP and TCP.

The *getnameinfo*( ) function shall be thread-safe.

RETURN VALUE

A zero return value for *getnameinfo*( ) indicates successful completion; a non-zero return value indicates failure. The possible values for the failures are listed in the ERRORS section.

Upon successful completion, *getnameinfo*( ) shall return the *node* and *service* names, if requested, in the buffers provided. The returned names are always null-terminated strings.

ERRORS

The *getnameinfo*( ) function shall fail and return the corresponding value if:

[EAI_AGAIN]	The name could not be resolved at this time. Future attempts may succeed.
[EAI_BADFLAGS]	The *flags* had an invalid value.
[EAI_FAIL]	A non-recoverable error occurred.
[EAI_FAMILY]	The address family was not recognized or the address length was invalid for the specified family.
[EAI_MEMORY]	There was a memory allocation failure.
[EAI_NONAME]	The name does not resolve for the supplied parameters. NI_NAMEREQD is set and the host's name cannot be located, or both *nodename* and *servname* were null.
[EAI_SYSTEM]	A system error occurred. The error code can be found in *errno*.

EXAMPLES

None.

APPLICATION USAGE

If the returned values are to be used as part of any further name resolution (for example, passed to *getaddrinfo*( )), applications should provide buffers large enough to store any result possible on the system.

RATIONALE

None.

FUTURE DIRECTIONS

None.

struct netent *getnetent(void);
```

DESCRIPTION

Refer to *endnetent*( ).

NAME

getopt, optarg, opterr, optind, optopt — command option parsing

SYNOPSIS

```
#include <unistd.h>

int getopt(int argc, char * const argv[], const char *optstring);
extern char *optarg;
extern int optind, opterr, optopt;
```

DESCRIPTION

The *getopt*( ) function is a command-line parser that shall follow Utility Syntax Guidelines 3, 4, 5, 6, 7, 9, and 10 in the Base Definitions volume of IEEE Std 1003.1-200x, Section 12.2, Utility Syntax Guidelines.

The parameters *argc* and *argv* are the argument count and argument array as passed to *main*( ) (see *exec*). The argument *optstring* is a string of recognized option characters; if a character is followed by a colon, the option takes an argument. All option characters allowed by Utility Syntax Guideline 3 are allowed in *optstring*. The implementation may accept other characters as an extension.

The variable *optind* is the index of the next element of the *argv*[] vector to be processed. It shall be initialized to 1 by the system, and *getopt*( ) shall update it when it finishes with each element of *argv*[ ]. When an element of *argv*[ ] contains multiple option characters, it is unspecified how *getopt*( ) determines which options have already been processed.

The *getopt*( ) function shall return the next option character (if one is found) from *argv* that matches a character in *optstring*, if there is one that matches. If the option takes an argument, *getopt*( ) shall set the variable *optarg* to point to the option-argument as follows:

1. If the option was the last character in the string pointed to by an element of *argv*, then *optarg* shall contain the next element of *argv*, and *optind* shall be incremented by 2. If the resulting value of *optind* is greater than *argc*, this indicates a missing option-argument, and *getopt*( ) shall return an error indication.
2. Otherwise, *optarg* shall point to the string following the option character in that element of *argv*, and *optind* shall be incremented by 1.

If, when *getopt*( ) is called:

`argv[optind]`	is a null pointer
`*argv[optind]`	is not the character `–`
`argv[optind]`	points to the string `"–"`

getopt( ) shall return –1 without changing *optind*. If:

`argv[optind]`	points to the string `"––"`

getopt( ) shall return –1 after incrementing *optind*.

If *getopt*( ) encounters an option character that is not contained in *optstring*, it shall return the question-mark (`'?'`) character. If it detects a missing option-argument, it shall return the colon character (`':'`) if the first character of *optstring* was a colon, or a question-mark character (`'?'`) otherwise. In either case, *getopt*( ) shall set the variable *optopt* to the option character that caused the error. If the application has not set the variable *opterr* to 0 and the first character of *optstring* is not a colon, *getopt*( ) shall also print a diagnostic message to *stderr* in the format specified for the *getopts* utility.

The *getopt*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

The *getopt*( ) function shall return the next option character specified on the command line.

A colon (’:’) shall be returned if *getopt*( ) detects a missing argument and the first character of *optstring* was a colon (’:’).

A question mark (’?’) shall be returned if *getopt*( ) encounters an option character not in *optstring* or detects a missing argument and the first character of *optstring* was not a colon (’:’).

Otherwise, *getopt*( ) shall return −1 when all command line options are parsed.

ERRORS

No errors are defined.

EXAMPLES

Parsing Command Line Options

The following code fragment shows how you might process the arguments for a utility that can take the mutually-exclusive options *a* and *b* and the options *f* and *o*, both of which require arguments:

```
#include <unistd.h>

int
main(int argc, char *argv[ ])
{
    int c;
    int bflg, aflg, errflg;
    char *ifile;
    char *ofile;
    extern char *optarg;
    extern int optind, optopt;
    . . .
    while ((c = getopt(argc, argv, ":abf:o:")) != -1) {
        switch(c) {
        case ’a’:
            if (bflg)
                errflg++;
            else
                aflg++;
            break;
        case ’b’:
            if (aflg)
                errflg++;
            else {
                bflg++;
                bproc();
            }
            break;
        case ’f’:
            ifile = optarg;
            break;
        case ’o’:
            ofile = optarg;
            break;
```

```
            case ’:’:       /* -f or -o without operand */
                    fprintf(stderr,
                            "Option -%c requires an operand\n", optopt);
                    errflg++;
                    break;
        case ’?’:
                    fprintf(stderr,
                            "Unrecognized option: -%c\n", optopt);
            errflg++;
        }
    }
    if (errflg) {
        fprintf(stderr, "usage: . . . ");
        exit(2);
    }
    for ( ; optind < argc; optind++) {
        if (access(argv[optind], R_OK)) {
    . . .
}
```

This code accepts any of the following as equivalent:

```
cmd −ao arg path path
cmd −a −o arg path path
cmd −o arg −a path path
cmd −a −o arg −− path path
cmd −a −oarg path path
cmd −aoarg path path
```

Checking Options and Arguments

The following example parses a set of command line options and prints messages to standard output for each option and argument that it encounters.

```
#include <unistd.h>
#include <stdio.h>
...
int c;
char *filename;
extern char *optarg;
extern int optind, optopt, opterr;
...
while ((c = getopt(argc, argv, ":abf:")) != -1) {
    switch(c) {
    case ’a’:
        printf("a is set\n");
        break;
    case ’b’:
        printf("b is set\n");
        break;
    case ’f’:
        filename = optarg;
        printf("filename is %s\n", filename);
        break;
```

```
        case ':':
            printf("-%c without filename\n", optopt);
            break;
        case '?':
            printf("unknown arg %c\n", optopt);
            break;
        }
    }
```

Selecting Options from the Command Line

The following example selects the type of database routines the user wants to use based on the *Options* argument.

```
#include <unistd.h>
#include <string.h>
...
char *Options = "hdbtl";
...
int dbtype, i;
char c;
char *st;
...
dbtype = 0;
while ((c = getopt(argc, argv, Options)) != −1) {
    if ((st = strchr(Options, c)) != NULL) {
        dbtype = st - Options;
        break;
    }
}
```

APPLICATION USAGE

The *getopt*( ) function is only required to support option characters included in Utility Syntax Guideline 3. Many historical implementations of *getopt*( ) support other characters as options. This is an allowed extension, but applications that use extensions are not maximally portable. Note that support for multi-byte option characters is only possible when such characters can be represented as type **int**.

RATIONALE

The *optopt* variable represents historical practice and allows the application to obtain the identity of the invalid option.

The description has been written to make it clear that *getopt*( ), like the *getopts* utility, deals with option-arguments whether separated from the option by <blank>s or not. Note that the requirements on *getopt*( ) and *getopts* are more stringent than the Utility Syntax Guidelines.

The *getopt*( ) function shall return −1, rather than EOF, so that **<stdio.h>** is not required.

The special significance of a colon as the first character of *optstring* makes *getopt*( ) consistent with the *getopts* utility. It allows an application to make a distinction between a missing argument and an incorrect option letter without having to examine the option letter. It is true that a missing argument can only be detected in one case, but that is a case that has to be considered.

FUTURE DIRECTIONS

None.

exec, the Base Definitions volume of IEEE Std 1003.1-200x, **<unistd.h>**, the Shell and Utilities volume of IEEE Std 1003.1-200x

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A note indicating that the *getopt*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

IEEE PASC Interpretation 1003.2 #150 is applied.

NAME

getpeername — get the name of the peer socket

SYNOPSIS

```
#include <sys/socket.h>

int getpeername(int socket, struct sockaddr *restrict address,
    socklen_t *restrict address_len);
```

DESCRIPTION

The *getpeername*( ) function shall retrieve the peer address of the specified socket, store this address in the **sockaddr** structure pointed to by the *address* argument, and store the length of this address in the object pointed to by the *address_len* argument.

If the actual length of the address is greater than the length of the supplied **sockaddr** structure, the stored address shall be truncated.

If the protocol permits connections by unbound clients, and the peer is not bound, then the value stored in the object pointed to by *address* is unspecified.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *getpeername*( ) function shall fail if:

[EBADF]	The *socket* argument is not a valid file descriptor.
[EINVAL]	The socket has been shut down.
[ENOTCONN]	The socket is not connected or otherwise has not had the peer prespecified.
[ENOTSOCK]	The *socket* argument does not refer to a socket.
[EOPNOTSUPP]	The operation is not supported for the socket protocol.

The *getpeername*( ) function may fail if:

[ENOBUFS]	Insufficient resources were available in the system to complete the call.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getpeername*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

NAME

getpgid — get the process group ID for a process

SYNOPSIS

XSI
```
#include <unistd.h>

pid_t getpgid(pid_t pid);
```

DESCRIPTION

The *getpgid*( ) function shall return the process group ID of the process whose process ID is equal to *pid*. If *pid* is equal to 0, *getpgid*( ) shall return the process group ID of the calling process.

RETURN VALUE

Upon successful completion, *getpgid*( ) shall return a process group ID. Otherwise, it shall return (**pid_t**)−1 and set *errno* to indicate the error.

ERRORS

The *getpgid*( ) function shall fail if:

[EPERM]	The process whose process ID is equal to *pid* is not in the same session as the calling process, and the implementation does not allow access to the process group ID of that process from the calling process.
[ESRCH]	There is no process with a process ID equal to *pid*.

The *getpgid*( ) function may fail if:

[EINVAL]	The value of the *pid* argument is invalid.

EXAMPLES

Issue 5

Moved from X/OPEN UNIX extension to BASE.

NAME

getpgrp — get the process group ID of the calling process

SYNOPSIS

```
#include <unistd.h>

pid_t getpgrp(void);
```

DESCRIPTION

The *getpgrp*( ) function shall return the process group ID of the calling process.

RETURN VALUE

The *getpgrp*( ) function shall always be successful and no return value is reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

4.3 BSD provides a *getpgrp*( ) function that returns the process group ID for a specified process. Although this function supports job control, all known job control shells always specify the calling process with this function. Thus, the simpler System V *getpgrp*( ) suffices, and the added complexity of the 4.3 BSD *getpgrp*( ) is provided by the XSI extension *getpgid*( ).

FUTURE DIRECTIONS

None.

NAME

getpriority, setpriority — get and set the nice value

SYNOPSIS

XSI

```
#include <sys/resource.h>

int getpriority(int which, id_t who);
int setpriority(int which, id_t who, int value);
```

DESCRIPTION

The *getpriority*( ) function shall obtain the nice value of a process, process group, or user. The *setpriority*( ) function shall set the nice value of a process, process group, or user to *value*+{NZERO}.

Target processes are specified by the values of the *which* and *who* arguments. The *which* argument may be one of the following values: PRIO_PROCESS, PRIO_PGRP, or PRIO_USER, indicating that the *who* argument is to be interpreted as a process ID, a process group ID, or an effective user ID, respectively. A 0 value for the *who* argument specifies the current process, process group, or user.

The nice value set with *setpriority*( ) shall be applied to the process. If the process is multi-threaded, the nice value shall affect all system scope threads in the process.

If more than one process is specified, *getpriority*( ) shall return value {NZERO} less than the lowest nice value pertaining to any of the specified processes, and *setpriority*( ) shall set the nice values of all of the specified processes to *value*+{NZERO}.

The default nice value is {NZERO}; lower nice values shall cause more favorable scheduling. While the range of valid nice values is [0,{NZERO}*2–1], implementations may enforce more restrictive limits. If *value*+{NZERO} is less than the system's lowest supported nice value, *setpriority*( ) shalls et the nice value to the lowest supported value; if *value*+{NZERO} is greater than the system's highest supported nice value, *setpriority*( ) shall set the nice value to the highest supported value.

Only a process with appropriate privileges can lower its nice value.

PS|TPS Any processes or threads using SCHED_FIFO or SCHED_RR shall be unaffected by a call to *setpriority*( ). This is not considered an error. A process which subsequently reverts to SCHED_OTHER need not have its priority affected by such a *setpriority*( ) call.

The effect of changing the nice value may vary depending on the process-scheduling algorithm in effect.

Since *getpriority*( ) can return the value –1 on successful completion, it is necessary to set *errno* to 0 prior to a call to *getpriority*( ). If *getpriority*( ) returns the value –1, then *errno* can be checked to see if an error occurred or if the value is a legitimate nice value.

RETURN VALUE

Upon successful completion, *getpriority*( ) shall return an integer in the range from –{NZERO} to {NZERO}–1. Otherwise, –1 shall be returned and *errno* set to indicate the error.

Upon successful completion, *setpriority*( ) shall return 0; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *getpriority*( ) and *setpriority*( ) functions shall fail if:

[ESRCH]	No process could be located using the *which* and *who* argument values specified.

[EINVAL]	The value of the *which* argument was not recognized, or the value of the *who* argument is not a valid process ID, process group ID, or user ID.

In addition, *setpriority*( ) may fail if:

[EPERM]	A process was located, but neither the real nor effective user ID of the executing process match the effective user ID of the process whose nice value is being changed.
[EACCES]	A request was made to change the nice value to a lower numeric value and the current process does not have appropriate privileges.

EXAMPLES

Using getpriority( )

The following example returns the current scheduling priority for the process ID returned by the call to *getpid*( ).

```
#include <sys/resource.h>
...
int which = PRIO_PROCESS;
id_t pid;
int ret;

pid = getpid();
ret = getpriority(which, pid);
```

Using setpriority( )

The following example sets the priority for the current process ID to –20.

```
#include <sys/resource.h>
...
int which = PRIO_PROCESS;
id_t pid;
int priority = -20;
int ret;

pid = getpid();
ret = setpriority(which, pid, priority);
```

APPLICATION USAGE

The *getpriority*( ) and *setpriority*( ) functions work with an offset nice value (nice value –{NZERO}). The nice value is in the range [0,2*{NZERO} –1], while the return value for *getpriority*( ) and the third parameter for *setpriority*( ) are in the range [–{NZERO},{NZERO} –1].

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

nice( ), *sched_get_priority_max*( ), *sched_setscheduler*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<sys/resource.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The DESCRIPTION is reworded in terms of the nice value rather than *priority* to avoid confusion with functionality in the POSIX Realtime Extension.

NAME

getprotobyname — network protocol database functions

SYNOPSIS

```
#include <netdb.h>

struct protoent *getprotobyname(const char *name);
```

DESCRIPTION

Refer to *endprotoent*( ).

```

DESCRIPTION

Refer to *endprotoent*( ).

NAME

getprotoent — network protocol database functions

SYNOPSIS

```
#include <netdb.h>

struct protoent *getprotoent(void);
```

DESCRIPTION

Refer to *endprotoent*( ).

NAME

getpwent — get user database entry

SYNOPSIS

XSI
```
#include <pwd.h>

struct passwd *getpwent(void);
```

DESCRIPTION

Refer to *endpwent*( ).

NAME

getpwnam, getpwnam_r — search user database for a name

SYNOPSIS

```
#include <pwd.h>

struct passwd *getpwnam(const char *name);
int getpwnam_r(const char *name, struct passwd *pwd, char *buffer,
    size_t bufsize, struct passwd **result);
```

TSF

DESCRIPTION

The *getpwnam*( ) function shall search the user database for an entry with a matching *name*.

The *getpwnam*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

Applications wishing to check for error situations should set *errno* to 0 before calling *getpwnam*( ). If *getpwnam*( ) returns a null pointer and *errno* is non-zero, an error occurred.

TSF The *getpwnam_r*( ) function shall update the **passwd** structure pointed to by *pwd* and store a pointer to that structure at the location pointed to by *result*. The structure shall contain an entry from the user database with a matching *name*. Storage referenced by the structure is allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. The maximum size needed for this buffer can be determined with the {_SC_GETPW_R_SIZE_MAX} *sysconf*( ) parameter. A NULL pointer shall be returned at the location pointed to by *result* on error or if the requested entry is not found.

RETURN VALUE

The *getpwnam*( ) function shall return a pointer to a **struct passwd** with the structure as defined in **<pwd.h>** with a matching entry if found. A null pointer shall be returned if the requested entry is not found, or an error occurs. On error, *errno* shall be set to indicate the error.

The return value may point to a static area which is overwritten by a subsequent call to *getpwent*( ), *getpwnam*( ), or *getpwuid*( ).

TSF If successful, the *getpwnam_r*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *getpwnam*( ) and *getpwnam_r*( ) functions may fail if:

[EIO]	An I/O error has occurred.
[EINTR]	A signal was caught during *getpwnam*( ).
[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
[ENFILE]	The maximum allowable number of files is currently open in the system.

The *getpwnam_r*( ) function may fail if:

TSF [ERANGE]	Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be referenced by the resulting **passwd** structure.

EXAMPLES

Getting an Entry for the Login Name

The following example uses the *getlogin*( ) function to return the name of the user who logged in; this information is passed to the *getpwnam*( ) function to get the user database entry for that user.

```
#include <sys/types.h>
#include <pwd.h>
#include <unistd.h>
#include <stdio.h>
#include <stdlib.h>
...
char *lgn;
struct passwd *pw;
...
if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
    fprintf(stderr, "Get of user information failed.\n"); exit(1);
}
...
```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid*(*geteuid*( )) returns the name associated with the effective user ID of the process; *getlogin*( ) returns the name associated with the current login activity; and *getpwuid*(*getuid*( )) returns the name associated with the real user ID of the process.

The *getpwnam_r*( ) function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

getpwuid( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<limits.h>**, **<pwd.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getpwnam_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getpwnam*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getpwnam_r*( ) function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the *name*.

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

NAME

getpwuid, getpwuid_r — search user database for a user ID

SYNOPSIS

```
#include <pwd.h>

struct passwd *getpwuid(uid_t uid);
```

TSF

```
int getpwuid_r(uid_t uid, struct passwd *pwd, char *buffer,
    size_t bufsize, struct passwd **result);
```

DESCRIPTION

The *getpwuid*( ) function shall search the user database for an entry with a matching *uid*.

The *getpwuid*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

Applications wishing to check for error situations should set *errno* to 0 before calling *getpwuid*( ). If *getpwuid*( ) returns a null pointer and *errno* is set to non-zero, an error occurred.

TSF The *getpwuid_r*( ) function shall update the **passwd** structure pointed to by *pwd* and store a pointer to that structure at the location pointed to by *result*. The structure shall contain an entry from the user database with a matching *uid*. Storage referenced by the structure is allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. The maximum size needed for this buffer can be determined with the {_SC_GETPW_R_SIZE_MAX} *sysconf*( ) parameter. A NULL pointer shall be returned at the location pointed to by *result* on error or if the requested entry is not found. |

RETURN VALUE

The *getpwuid*( ) function shall return a pointer to a **struct passwd** with the structure as defined in **<pwd.h>** with a matching entry if found. A null pointer shall be returned if the requested entry is not found, or an error occurs. On error, *errno* shall be set to indicate the error.

The return value may point to a static area which is overwritten by a subsequent call to *getpwent*( ), *getpwnam*( ), or *getpwuid*( ).

TSF If successful, the *getpwuid_r*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *getpwuid*( ) and *getpwuid_r*( ) functions may fail if:

[EIO]	An I/O error has occurred.
[EINTR]	A signal was caught during *getpwuid*( ).
[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
[ENFILE]	The maximum allowable number of files is currently open in the system.

The *getpwuid_r*( ) function may fail if:

[ERANGE]	Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be referenced by the resulting **passwd** structure.

TSF

EXAMPLES

Getting an Entry for the Root User

The following example gets the user database entry for the user with user ID 0 (root).

```
#include <sys/types.h>
#include <pwd.h>
...
uid_t id = 0;
struct passwd *pwd;

pwd = getpwuid(id);
```

Finding the Name for the Effective User ID

The following example defines *pws* as a pointer to a structure of type **passwd**, which is used to store the structure pointer returned by the call to the *getpwuid*( ) function. The *geteuid*( ) function shall return the effective user ID of the calling process; this is used as the search criteria for the *getpwuid*( ) function. The call to *getpwuid*( ) shall return a pointer to the structure containing that user ID value.

```
#include <unistd.h>
#include <sys/types.h>
#include <pwd.h>
...
struct passwd *pws;
pws = getpwuid(geteuid());
```

Finding an Entry in the User Database

The following example uses *getpwuid*( ) to search the user database for a user ID that was previously stored in a **stat** structure, then prints out the user name if it is found. If the user is not found, the program prints the numeric value of the user ID for the entry.

```
#include <sys/types.h>
#include <pwd.h>
#include <stdio.h>
...
struct stat statbuf;
struct passwd *pwd;
...
if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
    printf(" %-8.8s", pwd->pw_name);
else
    printf(" %-8d", statbuf.st_uid);
```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid*(*geteuid*( )) returns the name associated with the effective user ID of the process; *getlogin*( ) returns the name associated with the current login activity; and *getpwuid*(*getuid*( )) returns the name associated with the real user ID of the process.

The *getpwuid_r*( ) function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getpwuid_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getpwuid*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getpwuid_r*( ) function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the *uid*.

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

NAME

getrlimit, setrlimit — control maximum resource consumption

SYNOPSIS

XSI

```
#include <sys/resource.h>

int getrlimit(int resource, struct rlimit *rlp);
int setrlimit(int resource, const struct rlimit *rlp);

```

DESCRIPTION

The *getrlimit*( ) function shall get, and the *setrlimit*( ) function shall set, limits on the consumption of a variety of resources.

Each call to either *getrlimit*( ) or *setrlimit*( ) identifies a specific resource to be operated upon as well as a resource limit. A resource limit is represented by an **rlimit** structure. The *rlim_cur* member specifies the current or soft limit and the *rlim_max* member specifies the maximum or hard limit. Soft limits may be changed by a process to any value that is less than or equal to the hard limit. A process may (irreversibly) lower its hard limit to any value that is greater than or equal to the soft limit. Only a process with appropriate privileges can raise a hard limit. Both hard and soft limits can be changed in a single call to *setrlimit*( ) subject to the constraints described above.

The value RLIM_INFINITY, defined in **<sys/resource.h>**, shall be considered to be larger than any other limit value. If a call to *getrlimit*( ) returns RLIM_INFINITY for a resource, it means the implementation shall not enforce limits on that resource. Specifying RLIM_INFINITY as any resource limit value on a successful call to *setrlimit*( ) shall inhibit enforcement of that resource limit.

The following resources are defined:

RLIMIT_CORE	This is the maximum size of a core file, in bytes, that may be created by a process. A limit of 0 shall prevent the creation of a core file. If this limit is exceeded, the writing of a core file shall terminate at this size.
RLIMIT_CPU	This is the maximum amount of CPU time, in seconds, used by a process. If this limit is exceeded, SIGXCPU shall be generated for the process. If the process is catching or ignoring SIGXCPU, or all threads belonging to that process are blocking SIGXCPU, the behavior is unspecified.
RLIMIT_DATA	This is the maximum size of a process' data segment, in bytes. If this limit is exceeded, the *malloc*( ) function shall fail with *errno* set to [ENOMEM].
RLIMIT_FSIZE	This is the maximum size of a file, in bytes, that may be created by a process. If a write or truncate operation would cause this limit to be exceeded, SIGXFSZ shall be generated for the thread. If the thread is blocking, or the process is catching or ignoring SIGXFSZ, continued attempts to increase the size of a file from end-of-file to beyond the limit shall fail with *errno* set to [EFBIG].
RLIMIT_NOFILE	This is a number one greater than the maximum value that the system may assign to a newly-created descriptor. If this limit is exceeded, functions that allocate new file descriptors may fail with *errno* set to [EMFILE]. This limit constrains the number of file descriptors that a process may allocate.
RLIMIT_STACK	This is the maximum size of a process' stack, in bytes. The implementation does not automatically grow the stack beyond this limit.

	If this limit is exceeded, SIGSEGV shall be generated for the thread. If the thread is blocking SIGSEGV, or the process is ignoring or catching SIGSEGV and has not made arrangements to use an alternate stack, the disposition of SIGSEGV shall be set to SIG_DFL before it is generated.
RLIMIT_AS	This is the maximum size of a process' total available memory, in bytes. If this limit is exceeded, the *malloc*( ) and *mmap*( ) functions shall fail with *errno* set to [ENOMEM]. In addition, the automatic stack growth fails with the effects outlined above.

When using the *getrlimit*( ) function, if a resource limit can be represented correctly in an object of type **rlim_t**, then its representation is returned; otherwise, if the value of the resource limit is equal to that of the corresponding saved hard limit, the value returned shall be RLIM_SAVED_MAX; otherwise, the value returned shall be RLIM_SAVED_CUR.

When using the *setrlimit*( ) function, if the requested new limit is RLIM_INFINITY, the new limit shall be ‘‘no limit’’; otherwise, if the requested new limit is RLIM_SAVED_MAX, the new limit shall be the corresponding saved hard limit; otherwise, if the requested new limit is RLIM_SAVED_CUR, the new limit shall be the corresponding saved soft limit; otherwise, the new limit shall be the requested value. In addition, if the corresponding saved limit can be represented correctly in an object of type **rlim_t** then it shall be overwritten with the new limit.

The result of setting a limit to RLIM_SAVED_MAX or RLIM_SAVED_CUR is unspecified unless a previous call to *getrlimit*( ) returned that value as the soft or hard limit for the corresponding resource limit.

The determination of whether a limit can be correctly represented in an object of type **rlim_t** is implementation-defined. For example, some implementations permit a limit whose value is greater than RLIM_INFINITY and others do not.

The *exec* family of functions shall cause resource limits to be saved.

RETURN VALUE

Upon successful completion, *getrlimit*( ) and *setrlimit*( ) shall return 0. Otherwise, these functions shall return −1 and set *errno* to indicate the error.

ERRORS

The *getrlimit*( ) and *setrlimit*( ) functions shall fail if:

[EINVAL]	An invalid *resource* was specified; or in a *setrlimit*( ) call, the new *rlim_cur* exceeds the new *rlim_max*.
[EPERM]	The limit specified to *setrlimit*( ) would have raised the maximum limit value, and the calling process does not have appropriate privileges.

The *setrlimit*( ) function may fail if:

[EINVAL]	The limit specified cannot be lowered because current usage is already higher than the limit.

EXAMPLES

None.

APPLICATION USAGE

If a process attempts to set the hard limit or soft limit for RLIMIT_NOFILE to less than the value of {_POSIX_OPEN_MAX} from **<limits.h>**, unexpected behavior may occur.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

getrusage — get information about resource utilization

SYNOPSIS

XSI

```
#include <sys/resource.h>

int getrusage(int who, struct rusage *r_usage);
```

DESCRIPTION

The *getrusage*( ) function shall provide measures of the resources used by the current process or its terminated and waited-for child processes. If the value of the *who* argument is RUSAGE_SELF, information shall be returned about resources used by the current process. If the value of the *who* argument is RUSAGE_CHILDREN, information shall be returned about resources used by the terminated and waited-for children of the current process. If the child is never waited for (for example, if the parent has SA_NOCLDWAIT set or sets SIGCHLD to SIG_IGN), the resource information for the child process is discarded and not included in the resource information provided by *getrusage*( ). |

The *r_usage* argument is a pointer to an object of type **struct rusage** in which the returned information is stored.

RETURN VALUE

Upon successful completion, *getrusage*( ) shall return 0; otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *getrusage*( ) function shall fail if:

[EINVAL] The value of the *who* argument is not valid.

EXAMPLES

Using getrusage( )

The following example returns information about the resources used by the current process.

```
#include <sys/resource.h>
...
int who = RUSAGE_SELF;
struct rusage usage;
int ret;

ret = getrusage(who, &usage);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

NAME

gets — get a string from a stdin stream

SYNOPSIS

```
#include <stdio.h>

char *gets(char *s);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *gets*( ) function shall read bytes from the standard input stream, *stdin*, into the array pointed to by *s*, until a newline is read or an end-of-file condition is encountered. Any <newline> shall be discarded and a null byte shall be placed immediately after the last byte read into the array.

CX The *gets*( ) function may mark the *st_atime* field of the file associated with *stream* for update. The *st_atime* field shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ), *fread*( ), *getc*( ), *getchar*( ), *gets*( ), *fscanf*( ), or *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ).

RETURN VALUE

Upon successful completion, *gets*( ) shall return *s*. If the stream is at end-of-file, the end-of-file indicator for the stream shall be set and *gets*( ) shall return a null pointer. If a read error occurs, CX the error indicator for the stream shall be set, *gets*( ) shall return a null pointer and set *errno* to indicate the error.

ERRORS

Refer to *fgetc*( ).

EXAMPLES

None.

APPLICATION USAGE

Reading a line that overflows the array pointed to by *s* results in undefined behavior. The use of *fgets*( ) is recommended.

Since the user cannot specify the length of the buffer passed to *gets*( ), use of this function is discouraged. The length of the string read is unlimited. It is possible to overflow this buffer in such a way as to cause applications to fail, or possible system security violations.

It is recommended that the *fgets*( ) function should be used to read input lines.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

getsid — get the process group ID of a session leader

SYNOPSIS

XSI

```
#include <unistd.h>

pid_t getsid(pid_t pid);
```

DESCRIPTION

The *getsid*( ) function shall obtain the process group ID of the process that is the session leader of the process specified by *pid*. If *pid* is (**pid_t**)0, it specifies the calling process. |

RETURN VALUE

Upon successful completion, *getsid*( ) shall return the process group ID of the session leader of the specified process. Otherwise, it shall return (**pid_t**)–1 and set *errno* to indicate the error.

ERRORS

The *getsid*( ) function shall fail if:

[EPERM]	The process specified by *pid* is not in the same session as the calling process, and the implementation does not allow access to the process group ID of the session leader of that process from the calling process.
[ESRCH]	There is no process with a process ID equal to *pid*.

NAME

getsockname — get the socket name

SYNOPSIS

```
#include <sys/socket.h>

int getsockname(int socket, struct sockaddr *restrict address,
    socklen_t *restrict address_len);
```

DESCRIPTION

The *getsockname*( ) function shall retrieve the locally-bound name of the specified socket, store this address in the **sockaddr** structure pointed to by the *address* argument, and store the length of this address in the object pointed to by the *address_len* argument.

If the actual length of the address is greater than the length of the supplied **sockaddr** structure, the stored address shall be truncated.

If the socket has not been bound to a local name, the value stored in the object pointed to by *address* is unspecified.

RETURN VALUE

Upon successful completion, 0 shall be returned, the *address* argument shall point to the address of the socket, and the *address_len* argument shall point to the length of the address. Otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *getsockname*( ) function shall fail if:

[EBADF]	The *socket* argument is not a valid file descriptor.
[ENOTSOCK]	The *socket* argument does not refer to a socket.
[EOPNOTSUPP]	The operation is not supported for this socket's protocol.

The *getsockname*( ) function may fail if:

[EINVAL]	The socket has been shut down.
[ENOBUFS]	Insufficient resources were available in the system to complete the function.

EXAMPLES

None.

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getsockname*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

NAME

getsockopt — get the socket options

SYNOPSIS

```
#include <sys/socket.h>

int getsockopt(int socket, int level, int option_name,
    void *restrict option_value, socklen_t *restrict option_len);
```

DESCRIPTION

The *getsockopt*( ) function manipulates options associated with a socket.

The *getsockopt*( ) function shall retrieve the value for the option specified by the *option_name* argument for the socket specified by the *socket* argument. If the size of the option value is greater than *option_len*, the value stored in the object pointed to by the *option_value* argument shall be silently truncated. Otherwise, the object pointed to by the *option_len* argument shall be modified to indicate the actual length of the value.

The *level* argument specifies the protocol level at which the option resides. To retrieve options at the socket level, specify the *level* argument as SOL_SOCKET. To retrieve options at other levels, supply the appropriate level identifier for the protocol controlling the option. For example, to indicate that an option is interpreted by the TCP (Transmission Control Protocol), set *level* to IPPROTO_TCP as defined in the **<netinet/in.h>** header.

The socket in use may require the process to have appropriate privileges to use the *getsockopt*( ) function.

The *option_name* argument specifies a single option to be retrieved. It can be one of the following values defined in **<sys/socket.h>**:

SO_DEBUG	Reports whether debugging information is being recorded. This option shall store an **int** value. This is a Boolean option.
SO_ACCEPTCONN	Reports whether socket listening is enabled. This option shall store an **int** value. This is a Boolean option.
SO_BROADCAST	Reports whether transmission of broadcast messages is supported, if this is supported by the protocol. This option shall store an **int** value. This is a Boolean option.
SO_REUSEADDR	Reports whether the rules used in validating addresses supplied to *bind*( ) should allow reuse of local addresses, if this is supported by the protocol. This option shall store an **int** value. This is a Boolean option.
SO_KEEPALIVE	Reports whether connections are kept active with periodic transmission of messages, if this is supported by the protocol. If the connected socket fails to respond to these messages, the connection shall be broken and threads writing to that socket shall be notified with a SIGPIPE signal. This option shall store an **int** value. This is a Boolean option.
SO_LINGER	Reports whether the socket lingers on *close*( ) if data is present. If SO_LINGER is set, the system blocks the process during *close*( ) until it can transmit the data or until the end of the interval indicated by the *l_linger* member, whichever comes first. If SO_LINGER is not specified, and *close*( ) is issued, the system handles the call in a way that allows the process to continue as quickly as possible. This option shall store a **linger** structure.

SO_OOBINLINE	Reports whether the socket leaves received out-of-band data (data marked urgent) inline. This option shalls tore an **int** value. This is a Boolean option.
SO_SNDBUF	Reports send buffer size information. This option shall store an **int** value.
SO_RCVBUF	Reports receive buffer size information. This option shall store an **int** value.
SO_ERROR	Reports information about error status and clears it. This option shall store an **int** value.
SO_TYPE	Reports the socket type. This option shall store an **int** value. Socket types are described in Section 2.10.6 (on page 509).
SO_DONTROUTE	Reports whether outgoing messages bypass the standard routing facilities. The destination shall be on a directly-connected network, and messages are directed to the appropriate network interface according to the destination address. The effect, if any, of this option depends on what protocol is in use. This option shall store an **int** value. This is a Boolean option.
SO_RCVLOWAT	Reports the minimum number of bytes to process for socket input operations. The default value for SO_RCVLOWAT is 1. If SO_RCVLOWAT is set to a larger value, blocking receive calls normally wait until they have received the smaller of the low water mark value or the requested amount. (They may return less than the low water mark if an error occurs, a signal is caught, or the type of data next in the receive queue is different from that returned; for example, out-of-band data.) This option shall store an **int** value. Note that not all implementations allow this option to be retrieved.
SO_RCVTIMEO	Reports the timeout value for input operations. This option shall store a **timeval** structure with the number of seconds and microseconds specifying the limit on how long to wait for an input operation to complete. If a receive operation has blocked for this much time without receiving additional data, it shall return with a partial count or *errno* set to [EAGAIN] or [EWOULDBLOCK] if no data was received. The default for this option is zero, which indicates that a receive operation shall not time out. Note that not all implementations allow this option to be retrieved.
SO_SNDLOWAT	Reports the minimum number of bytes to process for socket output operations. Non-blocking output operations shall process no data if flow control does not allow the smaller of the send low water mark value or the entire request to be processed. This option shall store an **int** value. Note that not all implementations allow this option to be retrieved.
SO_SNDTIMEO	Reports the timeout value specifying the amount of time that an output function blocks because flow control prevents data from being sent. If a send operation has blocked for this time, it shall return with a partial count or with *errno* set to [EAGAIN] or [EWOULDBLOCK] if no data were sent. The default for this option is zero, which indicates that a send operation shall not time out. The option shall store a **timeval** structure. Note that not all implementations allow this option to be retrieved.

For Boolean options, a zero value indicates that the option is disabled and a non-zero value indicates that the option is enabled.

Options at other protocol levels vary in format and name.

The socket in use may require the process to have appropriate privileges to use the *getsockopt*( ) function.

RETURN VALUE

Upon successful completion, *getsockopt*( ) shall return 0; otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *getsockopt*( ) function shall fail if:

[EBADF]	The *socket* argument is not a valid file descriptor.
[EINVAL]	The specified option is invalid at the specified socket level.
[ENOPROTOOPT]	The option is not supported by the protocol.
[ENOTSOCK]	The *socket* argument does not refer to a socket.

The *getsockopt*( ) function may fail if:

[EACCES]	The calling process does not have the appropriate privileges.
[EINVAL]	The socket has been shut down.
[ENOBUFS]	Insufficient resources are available in the system to complete the function.

EXAMPLES

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getsockopt*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

NAME

getsubopt — parse suboption arguments from a string

SYNOPSIS

XSI

```
#include <stdlib.h>

int getsubopt(char **optionp, char * const *tokens, char **valuep);
```

DESCRIPTION

The *getsubopt*( ) function shall parse suboption arguments in a flag argument. Such options often result from the use of *getopt*( ).

The *getsubopt*( ) argument *optionp* is a pointer to a pointer to the option argument string. The suboption arguments shall be separated by commas and each may consist of either a single token, or a token-value pair separated by an equal sign.

The *keylistp* argument shall be a pointer to a vector of strings. The end of the vector is identified by a null pointer. Each entry in the vector is one of the possible tokens that might be found in **optionp*. Since commas delimit suboption arguments in *optionp*, they should not appear in any of the strings pointed to by *keylistp*. Similarly, because an equal sign separates a token from its value, the application should not include an equal sign in any of the strings pointed to by *keylistp*.

The *valuep* argument is the address of a value string pointer.

If a comma appears in *optionp*, it shall be interpreted as a suboption separator. After commas have been processed, if there are one or more equal signs in a suboption string, the first equal sign in any suboption string shall be interpreted as a separator between a token and a value. Subsequent equal signs in a suboption string shall be interpreted as part of the value.

If the string at **optionp* contains only one suboption argument (equivalently, no commas), *getsubopt*( ) shall update **optionp* to point to the nul character at the end of the string. Otherwise, it shall isolate the suboption argument by replacing the comma separator with a nul character, and shall update **optionp* to point to the start of the next suboption argument. If the suboption argument has an associated value (equivalently, contains an equal sign), *getsubopt*( ) shall update **valuep* to point to the value's first character. Otherwise, it shall set **valuep* to a null pointer. The calling application may use this information to determine whether the presence or absence of a value for the suboption is an error.

Additionally, when *getsubopt*( ) fails to match the suboption argument with a token in the *keylistp* array, the calling application should decide if this is an error, or if the unrecognized option should be processed in another way.

RETURN VALUE

The *getsubopt*( ) function shall return the index of the matched token string, or −1 if no token strings were matched.

ERRORS

No errors are defined.

EXAMPLES

```
#include <stdio.h>
#include <stdlib.h>

int do_all;
const char *type;
int read_size;
int write_size;
int read_only;

enum
{
    RO_OPTION = 0,
    RW_OPTION,
    READ_SIZE_OPTION,
    WRITE_SIZE_OPTION
};

const char *mount_opts[] =
{
    [RO_OPTION] = "ro",
    [RW_OPTION] = "rw",
    [READ_SIZE_OPTION] = "rsize",
    [WRITE_SIZE_OPTION] = "wsize",
    NULL
};

int
main(int argc, char *argv[])
{
    char *subopts, *value;
    int opt;

    while ((opt = getopt(argc, argv, "at:o:")) != -1)
        switch(opt)
            {
            case ’a’:
                do_all = 1;
                break;
            case ’t’:
                type = optarg;
                break;
            case ’o’:
                subopts = optarg;
                while (*subopts != ’\0’)
                    switch(getsubopt(&subopts, mount_opts, &value))
                {
                case RO_OPTION:
                    read_only = 1;
                    break;
                case RW_OPTION:
                    read_only = 0;
                    break;
                case READ_SIZE_OPTION:
```

```
                    if (value == NULL)
                        abort();
                    read_size = atoi(value);
                    break;
                case WRITE_SIZE_OPTION:
                    if (value == NULL)
                        abort();
                    write_size = atoi(value);
                    break;
                default:
                    /* Unknown suboption. */
                    printf("Unknown suboption ‘%s’\n", value);
                    break;
                }
            break;
        default:
            abort();
        }

    /* Do the real work. */

    return 0;
}
```

Parsing Suboptions

The following example uses the *getsubopt*( ) function to parse a value argument in the *optarg* external variable returned by a call to *getopt*( ).

```
#include <stdlib.h>
...
char *tokens[] = {"HOME", "PATH", "LOGNAME", (char *) NULL };
char *value;
int opt, index;

while ((opt = getopt(argc, argv, "e:")) != -1) {
    switch(opt)  {
    case ’e’ :
        while ((index = getsubopt(&optarg, tokens, &value)) != -1) {
            switch(index) {
...
        }
        break;
...
    }
}
...
```

NAME

gettimeofday — get the date and time

SYNOPSIS

XSI
```
#include <sys/time.h>

int gettimeofday(struct timeval *restrict tp, void *restrict tzp);

```

DESCRIPTION

The *gettimeofday*( ) function shall obtain the current time, expressed as seconds and microseconds since the Epoch, and store it in the **timeval** structure pointed to by *tp*. The resolution of the system clock is unspecified. |

If *tzp* is not a null pointer, the behavior is unspecified.

RETURN VALUE

The *gettimeofday*( ) function shall return 0 and no value shall be reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The DESCRIPTION is updated to refer to ‘‘seconds since the Epoch’’ rather than ‘‘seconds since 00:00:00 UTC (Coordinated Universal Time), January 1 1970’’ for consistency with other *time* functions.

The **restrict** keyword is added to the *gettimeofday*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

NAME

getuid — get a real user ID

SYNOPSIS

```
#include <unistd.h>

uid_t getuid(void);
```

DESCRIPTION

The *getuid*( ) function shall return the real user ID of the calling process.

RETURN VALUE

The *getuid*( ) function shall always be successful and no return value is reserved to indicate the error. |

ERRORS

No errors are defined.

EXAMPLES

Setting the Effective User ID to the Real User ID

The following example sets the effective user ID and the real user ID of the current process to the real user ID of the caller.

```
#include <unistd.h>
#include <sys/types.h>
...
setreuid(getuid(), getuid());
...
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

NAME

getutxent, getutxid, getutxline — get user accounting database entries

SYNOPSIS

XSI

```
#include <utmpx.h>

struct utmpx *getutxent(void);
struct utmpx *getutxid(const struct utmpx *id);
struct utmpx *getutxline(const struct utmpx *line);
```

DESCRIPTION

Refer to *endutxent*( ).

NAME

getwc — get a wide character from a stream

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

wint_t getwc(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *getwc*( ) function shall be equivalent to *fgetwc*( ), except that if it is implemented as a macro it may evaluate *stream* more than once, so the argument should never be an expression with side effects. |

RETURN VALUE

Refer to *fgetwc*( ).

ERRORS

Refer to *fgetwc*( ).

EXAMPLES

None.

APPLICATION USAGE

Since it may be implemented as a macro, *getwc*( ) may treat incorrectly a *stream* argument with side effects. In particular, *getwc*(**f*++) does not necessarily work as expected. Therefore, use of this function is not recommended; *fgetwc*( ) should be used instead. |

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

fgetwc( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdio.h>**, **<wchar.h>**

CHANGE HISTORY

First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working draft.

Issue 5

The Optional Header (OH) marking is removed from **<stdio.h>**.

NAME

getwchar — get a wide character from a stdin stream

SYNOPSIS

```
#include <wchar.h>

wint_t getwchar(void);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *getwchar*( ) function shall be equivalent to *getwc*(*stdin*).

RETURN VALUE

Refer to *fgetwc*( ).

ERRORS

Refer to *fgetwc*( ).

EXAMPLES

None.

APPLICATION USAGE

If the **wint_t** value returned by *getwchar*( ) is stored into a variable of type **wchar_t** and then compared against the **wint_t** macro WEOF, the result may be incorrect. Only the **wint_t** type is guaranteed to be able to represent any wide character and WEOF.

RATIONALE

None.

FUTURE DIRECTIONS

None.

fgetwc( ), *getwc*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<wchar.h>**

CHANGE HISTORY

First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working draft.

NAME

getwd — get the current working directory pathname (**LEGACY**)

SYNOPSIS

XSI

```
#include <unistd.h>

char *getwd(char *path_name);
```

DESCRIPTION

The *getwd*( ) function shall determine an absolute pathname of the current working directory of the calling process, and copy a string containing that pathname into the array pointed to by the *path_name* argument.

If the length of the pathname of the current working directory is greater than ({PATH_MAX}+1) including the null byte, *getwd*( ) shall fail and return a null pointer.

RETURN VALUE

Upon successful completion, a pointer to the string containing the absolute pathname of the current working directory shall be returned. Otherwise, *getwd*( ) shall return a null pointer and the contents of the array pointed to by *path_name* are undefined.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

For applications portability, the *getcwd*( ) function should be used to determine the current working directory instead of *getwd*( ).

RATIONALE

Since the user cannot specify the length of the buffer passed to *getwd*( ), use of this function is discouraged. The length of a pathname described in {PATH_MAX} is file system-dependent and may vary from one mount point to another, or might even be unlimited. It is possible to overflow this buffer in such a way as to cause applications to fail, or possible system security violations.

It is recommended that the *getcwd*( ) function should be used to determine the current working directory.

FUTURE DIRECTIONS

This function may be withdrawn in a future version.

SEE ALSO

getcwd( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<unistd.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

This function is marked LEGACY.

NAME

glob, globfree — generate pathnames matching a pattern

SYNOPSIS

```
#include <glob.h>

int glob(const char *restrict pattern, int flags,
    int(*errfunc)(const char *epath, int eerrno),
    glob_t *restrict pglob);
void globfree(glob_t *pglob);
```

DESCRIPTION

The *glob*( ) function is a pathname generator that shall implement the rules defined in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.13, Pattern Matching Notation, with optional support for rule 3 in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.13.3, Patterns Used for Filename Expansion.

The structure type **glob_t** is defined in **<glob.h>** and includes at least the following members:

Member Type	Member Name	Description
size_t	*gl_pathc*	Count of paths matched by *pattern*.
char **	*gl_pathv*	Pointer to a list of matched pathnames.
size_t	*gl_offs*	Slots to reserve at the beginning of *gl_pathv*.

The argument *pattern* is a pointer to a pathname pattern to be expanded. The *glob*( ) function shall match all accessible pathnames against this pattern and develop a list of all pathnames that match. In order to have access to a pathname, *glob*( ) requires search permission on every component of a path except the last, and read permission on each directory of any filename component of *pattern* that contains any of the following special characters: `'*'`, `'?'`, and `'['`.

The *glob*( ) function shall store the number of matched pathnames into *pglob->gl_pathc* and a pointer to a list of pointers to path names into *pglob->gl_pathv*. The pathnames shall be in sort order as defined by the current setting of the *LC_COLLATE* category; see the Base Definitions volume of IEEE Std 1003.1-200x, Section 7.3.2, LC_COLLATE. The first pointer after the last pathname shall be a null pointer. If the pattern does not match any pathnames, the returned number of matched paths is set to 0, and the contents of *pglob->gl_pathv* are implementation-defined.

It is the caller's responsibility to create the structure pointed to by *pglob*. The *glob*( ) function shall allocate other space as needed, including the memory pointed to by *gl_pathv*. The *globfree*( ) function shall free any space associated with *pglob* from a previous call to *glob*( ).

The *flags* argument is used to control the behavior of *glob*( ). The value of *flags* is a bitwise-inclusive OR of zero or more of the following constants, which are defined in **<glob.h>**:

GLOB_APPEND	Append pathnames generated to the ones from a previous call to *glob*( ).
GLOB_DOOFFS	Make use of *pglob->gl_offs*. If this flag is set, *pglob->gl_offs* is used to specify how many null pointers to add to the beginning of *pglob->gl_pathv*. In other words, *pglob->gl_pathv* shall point to *pglob->gl_offs* null pointers, followed by *pglob->gl_pathc* pathname pointers, followed by a null pointer.
GLOB_ERR	Cause *glob*( ) to return when it encounters a directory that it cannot open or read. Ordinarily, *glob*( ) continues to find matches.

GLOB_MARK	Each pathname that is a directory that matches *pattern* shall have a slash appended.
GLOB_NOCHECK	Supports rule 3 in the Shell and Utilities volume of IEEE Std 1003.1-200x, Section 2.13.3, Patterns Used for Filename Expansion. If *pattern* does not match any pathname, then *glob*( ) shall return a list consisting of only *pattern*, and the number of matched pathnames is 1.
GLOB_NOESCAPE	Disable backslash escaping.
GLOB_NOSORT	Ordinarily, *glob*( ) sorts the matching pathnames according to the current setting of the *LC_COLLATE* category, see the Base Definitions volume of IEEE Std 1003.1-200x, Section 7.3.2, LC_COLLATE . When this flag is used, the order of path names returned is unspecified.

The GLOB_APPEND flag can be used to append a new set of pathnames to those found in a previous call to *glob*( ). The following rules apply to applications when two or more calls to *glob*( ) are made with the same value of *pglob* and without intervening calls to *globfree*( ):

1. The first such call shall not set GLOB_APPEND. All subsequent calls shall set it.
2. All the calls shall set GLOB_DOOFFS, or all shall not set it.
3. After the second call, *pglob->gl_pathv* points to a list containing the following:
   a. Zero or more null pointers, as specified by GLOB_DOOFFS and *pglob->gl_offs*.
   b. Pointers to the pathnames that were in the *pglob->gl_pathv* list before the call, in the same order as before.
   c. Pointers to the new pathnames generated by the second call, in the specified order.
4. The count returned in *pglob->gl_pathc* shall be the total number of pathnames from the two calls.
5. The application can change any of the fields after a call to *glob*( ). If it does, the application shall reset them to the original value before a subsequent call, using the same *pglob* value, to *globfree*( ) or *glob*( ) with the GLOB_APPEND flag.

If, during the search, a directory is encountered that cannot be opened or read and *errfunc* is not a null pointer, *glob*( ) calls (**errfunc*( )) with two arguments:

1. The *epath* argument is a pointer to the path that failed.
2. The *eerrno* argument is the value of *errno* from the failure, as set by *opendir*( ), *readdir*( ), or *stat*( ). (Other values may be used to report other errors not explicitly documented for those functions.)

If (**errfunc*( )) is called and returns non-zero, or if the GLOB_ERR flag is set in *flags*, *glob*( ) shall stop the scan and return GLOB_ABORTED after setting *gl_pathc* and *gl_pathv* in *pglob* to reflect the paths already scanned. If GLOB_ERR is not set and either *errfunc* is a null pointer or (**errfunc*( )) returns 0, the error shall be ignored.

The *glob*( ) function shall not fail because of large files.

RETURN VALUE

Upon successful completion, *glob*( ) shall return 0. The argument *pglob->gl_pathc* shall return the number of matched pathnames and the argument *pglob->gl_pathv* shall contain a pointer to a null-terminated list of matched and sorted pathnames. However, if *pglob->gl_pathc* is 0, the content of *pglob->gl_pathv* is undefined.

The *globfree*( ) function shall not return a value.

If *glob*( ) terminates due to an error, it shall return one of the non-zero constants defined in **<glob.h>**. The arguments *pglob*->*gl_pathc* and *pglob*->*gl_pathv* are still set as defined above.

ERRORS

The *glob*( ) function shall fail and return the corresponding value if:

GLOB_ABORTED	The scan was stopped because GLOB_ERR was set or (**errfunc*( )) returned non-zero.
GLOB_NOMATCH	The pattern does not match any existing pathname, and GLOB_NOCHECK was not set in flags.
GLOB_NOSPACE	An attempt to allocate memory failed.

EXAMPLES

One use of the GLOB_DOOFFS flag is by applications that build an argument list for use with *execv*( ), *execve*( ), or *execvp*( ). Suppose, for example, that an application wants to do the equivalent of:

```
ls -l *.c
```

but for some reason:

```
system("ls -l *.c")
```

is not acceptable. The application could obtain approximately the same result using the sequence:

```
globbuf.gl_offs = 2;
glob("*.c", GLOB_DOOFFS, NULL, &globbuf);
globbuf.gl_pathv[0] = "ls";
globbuf.gl_pathv[1] = "-l";
execvp("ls", &globbuf.gl_pathv[0]);
```

Using the same example:

```
ls -l *.c *.h
```

could be approximately simulated using GLOB_APPEND as follows:

```
globbuf.gl_offs = 2;
glob("*.c", GLOB_DOOFFS, NULL, &globbuf);
glob("*.h", GLOB_DOOFFS|GLOB_APPEND, NULL, &globbuf);
...
```

APPLICATION USAGE

This function is not provided for the purpose of enabling utilities to perform pathname expansion on their arguments, as this operation is performed by the shell, and utilities are explicitly not expected to redo this. Instead, it is provided for applications that need to do pathname expansion on strings obtained from other sources, such as a pattern typed by a user or read from a file.

If a utility needs to see if a pathname matches a given pattern, it can use *fnmatch*( ).

Note that *gl_pathc* and *gl_pathv* have meaning even if *glob*( ) fails. This allows *glob*( ) to report partial results in the event of an error. However, if *gl_pathc* is 0, *gl_pathv* is unspecified even if *glob*( ) did not return an error.

The GLOB_NOCHECK option could be used when an application wants to expand a pathname if wildcards are specified, but wants to treat the pattern as just a string otherwise. The *sh* utility might use this for option-arguments, for example.

The new pathnames generated by a subsequent call with GLOB_APPEND are not sorted together with the previous pathnames. This mirrors the way that the shell handles pathname expansion when multiple expansions are done on a command line.

Applications that need tilde and parameter expansion should use *wordexp*( ).

RATIONALE

It was claimed that the GLOB_DOOFFS flag is unnecessary because it could be simulated using:

```
new = (char **)malloc((n + pglob->gl_pathc + 1)
       * sizeof(char *));
(void) memcpy(new+n, pglob->gl_pathv,
       pglob->gl_pathc * sizeof(char *));
(void) memset(new, 0, n * sizeof(char *));
free(pglob->gl_pathv);
pglob->gl_pathv = new;
```

However, this assumes that the memory pointed to by *gl_pathv* is a block that was separately created using *malloc*( ). This is not necessarily the case. An application should make no assumptions about how the memory referenced by fields in *pglob* was allocated. It might have been obtained from *malloc*( ) in a large chunk and then carved up within *glob*( ), or it might have been created using a different memory allocator. It is not the intent of the standard developers to specify or imply how the memory used by *glob*( ) is managed.

The GLOB_APPEND flag would be used when an application wants to expand several different patterns into a single list.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

Moved from POSIX2 C-language Binding to BASE.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The **restrict** keyword is added to the *glob*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

NAME

gmtime, gmtime_r — convert a time value to a broken-down UTC time

SYNOPSIS

```
#include <time.h>

struct tm *gmtime(const time_t *timer);
struct tm *gmtime_r(const time_t *restrict timer,
    struct tm *restrict result);
```

TSF

DESCRIPTION

CX For *gmtime*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *gmtime*( ) function shall convert the time in seconds since the Epoch pointed to by *timer* into a broken-down time, expressed as Coordinated Universal Time (UTC).

CX The relationship between a time in seconds since the Epoch used as an argument to *gmtime*( ) and the **tm** structure (defined in the **<time.h>** header) is that the result shall be as specified in the expression given in the definition of seconds since the Epoch (see the Base Definitions volume of IEEE Std 1003.1-200x, Section 4.14, Seconds Since the Epoch), where the names in the structure and in the expression correspond.

TSF The same relationship shall apply for *gmtime_r*( ).

CX The *gmtime*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

The *asctime*( ), *ctime*( ), *gmtime*( ), and *localtime*( ) functions shall return values in one of two static objects: a broken-down time structure and an array of type **char**. Execution of any of the functions may overwrite the information returned in either of these objects by any of the other functions.

TSF The *gmtime_r*( ) function shall convert the time in seconds since the Epoch pointed to by *timer* into a broken-down time expressed as Coordinated Universal Time (UTC). The broken-down time is stored in the structure referred to by *result*. The *gmtime_r*( ) function shall also return the address of the same structure.

RETURN VALUE

The *gmtime*( ) function shall return a pointer to a **struct tm**.

TSF Upon successful completion, *gmtime_r*( ) shall return the address of the structure pointed to by the argument *result*. If an error is detected, or UTC is not available, *gmtime_r*( ) shall return a null pointer.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *gmtime_r*( ) function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call. |

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

asctime( ), *clock*( ), *ctime*( ), *difftime*( ), *localtime*( ), *mktime*( ), *strftime*( ), *strptime*( ), *time*( ), *utime*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<time.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A note indicating that the *gmtime*( ) function need not be reentrant is added to the DESCRIPTION.

The *gmtime_r*( ) function is included for alignment with the POSIX Threads Extension.

Issue 6

The *gmtime_r*( ) function is marked as part of the Thread-Safe Functions option.

Extensions beyond the ISO C standard are now marked.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The **restrict** keyword is added to the *gmtime_r*( ) prototype for alignment with the ISO / IEC 9899: 1999 standard.

NAME

grantpt — grant access to the slave pseudo-terminal device

SYNOPSIS

XSI

```
#include <stdlib.h>

int grantpt(int fildes);
```

DESCRIPTION

The *grantpt*( ) function shall change the mode and ownership of the slave pseudo-terminal device associated with its master pseudo-terminal counterpart. The *fildes* argument is a file descriptor that refers to a master pseudo-terminal device. The user ID of the slave shall be set to the real UID of the calling process and the group ID shall be set to an unspecified group ID. The permission mode of the slave pseudo-terminal shall be set to readable and writable by the owner, and writable by the group.

The behavior of the *grantpt*( ) function is unspecified if the application has installed a signal handler to catch SIGCHLD signals.

RETURN VALUE

Upon successful completion, *grantpt*( ) shall return 0; otherwise, it shall return −1 and set *errno* to indicate the error.

ERRORS

The *grantpt*( ) function may fail if:

[EBADF]	The *fildes* argument is not a valid open file descriptor.
[EINVAL]	The *fildes* argument is not associated with a master pseudo-terminal device.
[EACCES]	The corresponding slave pseudo-terminal device could not be accessed.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section in previous issues.

NAME

h_errno — error return value for network database operations

SYNOPSIS

OB

```
#include <netdb.h>
```

DESCRIPTION

Note that this method of returning errors is used only in connection with obsolescent functions.

The **<netdb.h>** header provides a declaration of *h_errno* as a modifiable *l*-value of type **int**.

It is unspecified whether *h_errno* is a macro or an identifier declared with external linkage. If a macro definition is suppressed in order to access an actual object, or a program defines an identifier with the name *h_errno*, the behavior is undefined.

RETURN VALUE

None.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Applications should obtain the definition of *h_errno* by the inclusion of the **<netdb.h>** header.

RATIONALE

None.

FUTURE DIRECTIONS

h_errno may be withdrawn in a future version.

SEE ALSO

endhostent( ), *errno*, the Base Definitions volume of IEEE Std 1003.1-200x, **<netdb.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

hcreate, hdestroy, hsearch — manage hash search table

SYNOPSIS

XSI

```
#include <search.h>

int hcreate(size_t nel);
void hdestroy(void);
ENTRY *hsearch(ENTRY item, ACTION action);
```

DESCRIPTION

The *hcreate*( ), *hdestroy*( ), and *hsearch*( ) functions shall manage hash search tables. |

The *hcreate*( ) function shall allocate sufficient space for the table, and the application shall | ensure it is called before *hsearch*( ) is used. The *nel* argument is an estimate of the maximum | number of entries that the table shall contain. This number may be adjusted upward by the algorithm in order to obtain certain mathematically favorable circumstances.

The *hdestroy*( ) function shall dispose of the search table, and may be followed by another call to | *hcreate*( ). After the call to *hdestroy*( ), the data can no longer be considered accessible.

The *hsearch*( ) function is a hash-table search routine. It shall return a pointer into a hash table indicating the location at which an entry can be found. The *item* argument is a structure of type **ENTRY** (defined in the **<search.h>** header) containing two pointers: *item.key* points to the comparison key (a **char ***), and *item.data* (a **void ***) points to any other data to be associated with that key. The comparison function used by *hsearch*( ) is *strcmp*( ). The *action* argument is a member of an enumeration type **ACTION** indicating the disposition of the entry if it cannot be found in the table. ENTER indicates that the item should be inserted in the table at an appropriate point. FIND indicates that no entry should be made. Unsuccessful resolution is indicated by the return of a null pointer.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

The *hcreate*( ) function shall return 0 if it cannot allocate sufficient space for the table; otherwise, it shall return non-zero.

The *hdestroy*( ) function shall not return a value.

The *hsearch*( ) function shall return a null pointer if either the action is FIND and the item could not be found or the action is ENTER and the table is full.

ERRORS

The *hcreate*( ) and *hsearch*( ) functions may fail if:

[ENOMEM]	Insufficient storage space is available.

EXAMPLES

The following example reads in strings followed by two numbers and stores them in a hash table, discarding duplicates. It then reads in strings and finds the matching entry in the hash table and prints it out.

```
#include <stdio.h>
#include <search.h>
#include <string.h>

struct info {        /* This is the info stored in the table */
    int age, room;   /* other than the key. */
```

```
};
#define NUM_EMPL    5000    /* # of elements in search table. */
int main(void)
{
    char string_space[NUM_EMPL*20];   /* Space to store strings. */
    struct info info_space[NUM_EMPL]; /* Space to store employee info. */
    char *str_ptr = string_space;     /* Next space in string_space. */
    struct info *info_ptr = info_space;
                                      /* Next space in info_space. */
    ENTRY item;
    ENTRY *found_item; /* Name to look for in table. */
    char name_to_find[30];
    int i = 0;
    /* Create table; no error checking is performed. */
    (void) hcreate(NUM_EMPL);
    while (scanf("%s%d%d", str_ptr, &info_ptr->age,
           &info_ptr->room) != EOF && i++ < NUM_EMPL) {
        /* Put information in structure, and structure in item. */
        item.key = str_ptr;
        item.data = info_ptr;
        str_ptr += strlen(str_ptr) + 1;
        info_ptr++;
        /* Put item into table. */
        (void) hsearch(item, ENTER);
    }
    /* Access table. */
    item.key = name_to_find;
    while (scanf("%s", item.key) != EOF) {
        if ((found_item = hsearch(item, FIND)) != NULL) {
            /* If item is in the table. */
            (void)printf("found %s, age = %d, room = %d\n",
                found_item->key,
                ((struct info *)found_item->data)->age,
                ((struct info *)found_item->data)->room);
        } else
            (void)printf("no such employee %s\n", name_to_find);
    }
    return 0;
}
```

APPLICATION USAGE

The *hcreate*( ) and *hsearch*( ) functions may use *malloc*( ) to allocate space.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

htonl, htons, ntohl, ntohs — convert values between host and network byte order

SYNOPSIS

```
#include <arpa/inet.h>

uint32_t htonl(uint32_t hostlong);
uint16_t htons(uint16_t hostshort);
uint32_t ntohl(uint32_t netlong);
uint16_t ntohs(uint16_t netshort);
```

DESCRIPTION

These functions shall convert 16-bit and 32-bit quantities between network byte order and host byte order.

On some implementations, these functions are defined as macros.

The **uint32_t** and **uint16_t** types are defined in **<inttypes.h>**.

RETURN VALUE

The *htonl*( ) and *htons*( ) functions shall return the argument value converted from host to network byte order.

The *ntohl*( ) and *ntohs*( ) functions shall return the argument value converted from network to host byte order.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

These functions are most often used in conjunction with IPv4 addresses and ports as returned by *gethostent*( ) and *getservent*( ).

NAME

htons — convert values between host and network byte order

SYNOPSIS

```
#include <arpa/inet.h>

uint16_t htons(uint16_t hostshort);
```

DESCRIPTION

Refer to *htonl*( ).

NAME

hypot, hypotf, hypotl — Euclidean distance function

SYNOPSIS

```
#include <math.h>

double hypot(double x, double y);
float hypotf(float x, float y);
long double hypotl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall compute the value of the square root of x^2+y^2 without undue overflow or underflow.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the length of the hypotenuse of a right-angled triangle with sides of length *x* and *y*.

If the correct value would cause overflow, a range error shall occur and *hypot*( ), *hypotf*( ), and *hypotl*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

MX If *x* or *y* is ±Inf, +Inf shall be returned (even if one of *x* or *y* is NaN).

If *x* or *y* is NaN, and the other is not ±Inf, a NaN shall be returned.

If both arguments are subnormal and the correct result is subnormal, a range error may occur and the correct result is returned.

ERRORS

These functions shall fail if:

Range Error The result overflows.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

MX Range Error The result underflows.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

hypot(*x*,*y*), *hypot*(*y*,*x*), and *hypot*(*x*, −*y*) are equivalent.

hypot(*x*, ±0) is equivalent to *fabs*(*x*).

Underflow only happens when both *x* and *y* are subnormal and the (inexact) result is also subnormal.

These functions take precautions against overflow during intermediate steps of the computation.

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

feclearexcept( ), *fetestexcept*( ), *isnan*( ), *sqrt*( ), the Base Definitions volume of IEEE Std 1003.1-200x, Section 4.18, Treatment of Error Conditions for Mathematical Functions, **<math.h>** |

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *hypot*( ) function is no longer marked as an extension.

The *hypotf*( ) and *hypotl*( ) functions are added for alignment with the ISO / IEC 9899: 1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO / IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO / IEC 9899: 1999 standard are marked.

NAME

iconv — codeset conversion function

SYNOPSIS

XSI

```
#include <iconv.h>

size_t iconv(iconv_t cd, char **restrict inbuf,
    size_t *restrict inbytesleft, char **restrict outbuf,
    size_t *restrict outbytesleft);
```

DESCRIPTION

The *iconv*( ) function shall convert the sequence of characters from one codeset, in the array specified by *inbuf*, into a sequence of corresponding characters in another codeset, in the array specified by *outbuf*. The codesets are those specified in the *iconv_open*( ) call that returned the conversion descriptor, *cd*. The *inbuf* argument points to a variable that points to the first character in the input buffer and *inbytesleft* indicates the number of bytes to the end of the buffer to be converted. The *outbuf* argument points to a variable that points to the first available byte in the output buffer and *outbytesleft* indicates the number of the available bytes to the end of the buffer.

For state-dependent encodings, the conversion descriptor *cd* is placed into its initial shift state by a call for which *inbuf* is a null pointer, or for which *inbuf* points to a null pointer. When *iconv*( ) is called in this way, and if *outbuf* is not a null pointer or a pointer to a null pointer, and *outbytesleft* points to a positive value, *iconv*( ) shall place, into the output buffer, the byte sequence to change the output buffer to its initial shift state. If the output buffer is not large enough to hold the entire reset sequence, *iconv*( ) shall fail and set *errno* to [E2BIG]. Subsequent calls with *inbuf* as other than a null pointer or a pointer to a null pointer cause the conversion to take place from the current state of the conversion descriptor.

If a sequence of input bytes does not form a valid character in the specified codeset, conversion shall stop after the previous successfully converted character. If the input buffer ends with an incomplete character or shift sequence, conversion shall stop after the previous successfully converted bytes. If the output buffer is not large enough to hold the entire converted input, conversion shall stop just prior to the input bytes that would cause the output buffer to overflow. The variable pointed to by *inbuf* shall be updated to point to the byte following the last byte successfully used in the conversion. The value pointed to by *inbytesleft* shall be decremented to reflect the number of bytes still not converted in the input buffer. The variable pointed to by *outbuf* shall be updated to point to the byte following the last byte of converted output data. The value pointed to by *outbytesleft* shall be decremented to reflect the number of bytes still available in the output buffer. For state-dependent encodings, the conversion descriptor shall be updated to reflect the shift state in effect at the end of the last successfully converted byte sequence.

If *iconv*( ) encounters a character in the input buffer that is valid, but for which an identical character does not exist in the target codeset, *iconv*( ) shall perform an implementation-defined conversion on this character.

RETURN VALUE

The *iconv*( ) function shall update the variables pointed to by the arguments to reflect the extent of the conversion and return the number of non-identical conversions performed. If the entire string in the input buffer is converted, the value pointed to by *inbytesleft* shall be 0. If the input conversion is stopped due to any conditions mentioned above, the value pointed to by *inbytesleft* shall be non-zero and *errno* shall be set to indicate the condition. If an error occurs *iconv*( ) shall return (**size_t**)–1 and set *errno* to indicate the error.

ERRORS

The *iconv*( ) function shall fail if:

[EILSEQ] Input conversion stopped due to an input byte that does not belong to the input codeset.

[E2BIG] Input conversion stopped due to lack of space in the output buffer.

[EINVAL] Input conversion stopped due to an incomplete character or shift sequence at the end of the input buffer.

The *iconv*( ) function may fail if:

[EBADF] The *cd* argument is not a valid open conversion descriptor.

EXAMPLES

None.

APPLICATION USAGE

The *inbuf* argument indirectly points to the memory area which contains the conversion input data. The *outbuf* argument indirectly points to the memory area which is to contain the result of the conversion. The objects indirectly pointed to by *inbuf* and *outbuf* are not restricted to containing data that is directly representable in the ISO C standard language **char** data type. The type of *inbuf* and *outbuf*, **char ****, does not imply that the objects pointed to are interpreted as null-terminated C strings or arrays of characters. Any interpretation of a byte sequence that represents a character in a given character set encoding scheme is done internally within the codeset converters. For example, the area pointed to indirectly by *inbuf* and/or *outbuf* can contain all zero octets that are not interpreted as string terminators but as coded character data according to the respective codeset encoding scheme. The type of the data (**char**, **short**, **long**, and so on) read or stored in the objects is not specified, but may be inferred for both the input and output data by the converters determined by the *fromcode* and *tocode* arguments of *iconv_open*( ).

Regardless of the data type inferred by the converter, the size of the remaining space in both input and output objects (the *intbytesleft* and *outbytesleft* arguments) is always measured in bytes.

For implementations that support the conversion of state-dependent encodings, the conversion descriptor must be able to accurately reflect the shift-state in effect at the end of the last successful conversion. It is not required that the conversion descriptor itself be updated, which would require it to be a pointer type. Thus, implementations are free to implement the descriptor as a handle (other than a pointer type) by which the conversion information can be accessed and updated.

Issue 6

The SYNOPSIS has been corrected to align with the **<iconv.h>** reference page.

The **restrict** keyword is added to the *iconv*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

NAME

iconv_close — codeset conversion deallocation function

SYNOPSIS

XSI
```
#include <iconv.h>

int iconv_close(iconv_t cd);
```

DESCRIPTION

The *iconv_close*( ) function shall deallocate the conversion descriptor *cd* and all other associated resources allocated by *iconv_open*( ). |

If a file descriptor is used to implement the type **iconv_t**, that file descriptor shall be closed. |

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *iconv_close*( ) function may fail if:

[EBADF]	The conversion descriptor is invalid.

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 4. Derived from the HP-UX Manual.

NAME

iconv_open — codeset conversion allocation function

SYNOPSIS

XSI

```
#include <iconv.h>

iconv_t iconv_open(const char *tocode, const char *fromcode);
```

DESCRIPTION

The *iconv_open*( ) function shall return a conversion descriptor that describes a conversion from the codeset specified by the string pointed to by the *fromcode* argument to the codeset specified by the string pointed to by the *tocode* argument. For state-dependent encodings, the conversion descriptor shall be in a codeset-dependent initial shift state, ready for immediate use with *iconv*( ). |

Settings of *fromcode* and *tocode* and their permitted combinations are implementation-defined.

A conversion descriptor shall remain valid until it is closed by *iconv_close*( ) or an implicit close. |

If a file descriptor is used to implement conversion descriptors, the FD_CLOEXEC flag shall be set; see **<fcntl.h>**.

RETURN VALUE

Upon successful completion, *iconv_open*( ) shall return a conversion descriptor for use on subsequent calls to *iconv*( ). Otherwise, *iconv_open*( ) shall return (**iconv_t**)–1 and set *errno* to indicate the error.

ERRORS

The *iconv_open*( ) function may fail if:

[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
[ENFILE]	Too many files are currently open in the system.
[ENOMEM]	Insufficient storage space is available.
[EINVAL]	The conversion specified by *fromcode* and *tocode* is not supported by the implementation.

EXAMPLES

None.

APPLICATION USAGE

Some implementations of *iconv_open*( ) use *malloc*( ) to allocate space for internal buffer areas. The *iconv_open*( ) function may fail if there is insufficient storage space to accommodate these buffers.

Conforming applications must assume that conversion descriptors are not valid after a call to one of the *exec* functions. |

NAME

if_freenameindex — free memory allocated by *if_nameindex*( )

SYNOPSIS

```
#include <net/if.h>

void if_freenameindex(struct if_nameindex *ptr);
```

DESCRIPTION

The *if_freenameindex*( ) function shall free the memory allocated by *if_nameindex*( ). The *ptr* argument shall be a pointer that was returned by *if_nameindex*( ). After *if_freenameindex*( ) has been called, the application shall not use the array of which *ptr* is the address.

RETURN VALUE

None.

ERRORS

No errors are defined.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

if_indextoname — map a network interface index to its corresponding name

SYNOPSIS

```
#include <net/if.h>

char *if_indextoname(unsigned ifindex, char *ifname);
```

DESCRIPTION

The *if_indextoname*( ) function shall map an interface index to its corresponding name.

When this function is called, *ifname* shall point to a buffer of at least {IFNAMSIZ} bytes. The function shall place in this buffer the name of the interface with index *ifindex*.

RETURN VALUE

If *ifindex* is an interface index, then the function shall return the value supplied in *ifname*, which points to a buffer now containing the interface name. Otherwise, the function shall return a NULL pointer and set *errno* to indicate the error.

ERRORS

The *if_indextoname*( ) function shall fail if:

[ENXIO] The interface does not exist.

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

if_nameindex — return all network interface names and indexes

SYNOPSIS

```
#include <net/if.h>

struct if_nameindex *if_nameindex(void);
```

DESCRIPTION

The *if_nameindex*( ) function shall return an array of *if_nameindex* structures, one structure per interface. The end of the array is indicated by a structure with an *if_index* field of zero and an *if_name* field of NULL.

Applications should call *if_freenameindex*( ) to release the memory that may be dynamically allocated by this function, after they have finished using it.

RETURN VALUE

Array of structures identifying local interfaces. A NULL pointer is returned upon an error, with *errno* set to indicate the error.

ERRORS

The *if_nameindex*( ) function may fail if:

[ENOBUFS]	Insufficient resources are available to complete the function.

EXAMPLES

None.

APPLICATION USAGE

None.

NAME

if_nametoindex — map a network interface name to its corresponding index

SYNOPSIS

```
#include <net/if.h>

unsigned if_nametoindex(const char *ifname);
```

DESCRIPTION

The *if_nametoindex*( ) function shall return the interface index corresponding to name *ifname*.

RETURN VALUE

The corresponding index if *ifname* is the name of an interface; otherwise, zero.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

NAME

ilogb, ilogbf, ilogbl — return an unbiased exponent

SYNOPSIS

```
#include <math.h>

int ilogb(double x);
int ilogbf(float x);
int ilogbl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

These functions shall return the exponent part of their argument *x*. Formally, the return value is the integral part of $\log_r | x |$ as a signed integral value, for non-zero *x*, where *r* is the radix of the machine's floating-point arithmetic, which is the value of FLT_RADIX defined in **<float.h>**.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the exponent part of *x* as a signed integer value. They are equivalent to calling the corresponding *logb*( ) function and casting the returned value to type **int**.

XSI If *x* is 0, a domain error shall occur, and the value FP_ILOGB0 shall be returned.

XSI If *x* is ±Inf, a domain error shall occur, and the value {INT_MAX} shall be returned.

XSI If *x* is a NaN, a domain error shall occur, and the value FP_ILOGBNAN shall be returned.

XSI If the correct value is greater than {INT_MAX}, {INT_MAX} shall be returned and a domain error shall occur.

If the correct value is less than {INT_MIN}, {INT_MIN} shall be returned and a domain error shall occur.

ERRORS

These functions shall fail if:

XSI Domain Error The *x* argument is zero, NaN, or ±Inf, or the correct value is not representable as an integer.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

The errors come from taking the expected floating-point value and converting it to **int**, which is invalid operation in IEEE Std 754-1985 (since overflow, infinity, and NaN are not representable in a type **int**), so should be a domain error.

There are no known implementations that overflow. For overflow to happen, {INT_MAX} must be less than LDBL_MAX_EXP**log2*(FLT_RADIX) or {INT_MIN} must be greater than LDBL_MIN_EXP**log2*(FLT_RADIX) if subnormals are not supported, or {INT_MIN} must be greater than (LDBL_MIN_EXP-LDBL_MANT_DIG)**log2*(FLT_RADIX) if subnormals are supported.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The *ilogb*( ) function is no longer marked as an extension.

The *ilogbf*( ) and *ilogbl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The RETURN VALUE section is revised for alignment with the ISO/IEC 9899:1999 standard.

XSI extensions are marked.

NAME

imaxabs — return absolute value

SYNOPSIS

```
#include <inttypes.h>

intmax_t imaxabs(intmax_t j);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *imaxabs*( ) function shall compute the absolute value of an integer *j*. If the result cannot be represented, the behavior is undefined.

RETURN VALUE

The *imaxabs*( ) function shall return the absolute value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The absolute value of the most negative number cannot be represented in two's complement.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

imaxdiv — return quotient and remainder

SYNOPSIS

```
#include <inttypes.h>

imaxdiv_t imaxdiv(intmax_t numer, intmax_t denom);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *imaxdiv*( ) function shall compute *numer* / *denom* and *numer* % *denom* in a single operation.

RETURN VALUE

The *imaxdiv*( ) function shall return a structure of type **imaxdiv_t**, comprising both the quotient and the remainder. The structure shall contain (in either order) the members *quot* (the quotient) and *rem* (the remainder), each of which has type **intmax_t**.

If either part of the result cannot be represented, the behavior is undefined.

ERRORS

No errors are defined.

NAME

index — character string operations (**LEGACY**)

SYNOPSIS

XSI

```
#include <strings.h>

char *index(const char *s, int c);
```

DESCRIPTION

The *index*( ) function shall be equivalent to *strchr*( ).

RETURN VALUE

See *strchr*( ).

ERRORS

See *strchr*( ).

EXAMPLES

None.

APPLICATION USAGE

strchr( ) is preferred over this function.

For maximum portability, it is recommended to replace the function call to *index*( ) as follows:

```
#define index(a,b) strchr((a),(b))
```

RATIONALE

None.

FUTURE DIRECTIONS

This function may be withdrawn in a future version.

SEE ALSO

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X / OPEN UNIX extension to BASE.

Issue 6

This function is marked LEGACY.

NAME

inet_addr, inet_ntoa — IPv4 address manipulation

SYNOPSIS

```
#include <arpa/inet.h>

in_addr_t inet_addr(const char *cp);
char *inet_ntoa(struct in_addr in);
```

DESCRIPTION

The *inet_addr*( ) function shall convert the string pointed to by *cp*, in the standard IPv4 dotted decimal notation, to an integer value suitable for use as an Internet address.

The *inet_ntoa*( ) function shall convert the Internet host address specified by *in* to a string in the Internet standard dot notation.

The *inet_ntoa*( ) function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

All Internet addresses shall be returned in network order (bytes ordered from left to right).

Values specified using IPv4 dotted decimal notation take one of the following forms:

`a.b.c.d`	When four parts are specified, each shall be interpreted as a byte of data and assigned, from left to right, to the four bytes of an Internet address.
`a.b.c`	When a three-part address is specified, the last part shall be interpreted as a 16-bit quantity and placed in the rightmost two bytes of the network address. This makes the three-part address format convenient for specifying Class B network addresses as **128.net.host**.
`a.b`	When a two-part address is supplied, the last part shall be interpreted as a 24-bit quantity and placed in the rightmost three bytes of the network address. This makes the two-part address format convenient for specifying Class A network addresses as **net.host**.
`a`	When only one part is given, the value shall be stored directly in the network address without any byte rearrangement.

All numbers supplied as parts in IPv4 dotted decimal notation may be decimal, octal, or hexadecimal, as specified in the ISO C standard (that is, a leading 0x or 0X implies hexadecimal; otherwise, a leading `'0'` implies octal; otherwise, the number is interpreted as decimal).

RETURN VALUE

Upon successful completion, *inet_addr*( ) shall return the Internet address. Otherwise, it shall return (**in_addr_t**)(−1).

The *inet_ntoa*( ) function shall return a pointer to the network address in Internet standard dot notation.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The return value of *inet_ntoa*( ) may point to static data that may be overwritten by subsequent calls to *inet_ntoa*( ).

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

endhostent( ), *endnetent*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<arpa/inet.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

inet_ntoa — IPv4 address manipulation

SYNOPSIS

```
#include <arpa/inet.h>

char *inet_ntoa(struct in_addr in);
```

DESCRIPTION

Refer to *inet_addr*( ).

NAME

inet_ntop, inet_pton — convert IPv4 and IPv6 addresses between binary and text form

SYNOPSIS

```
#include <arpa/inet.h>

const char *inet_ntop(int af, const void *restrict src,
    char *restrict dst, socklen_t size);
int inet_pton(int af, const char *restrict src, void *restrict dst);
```

DESCRIPTION

The *inet_ntop*( ) function shall convert a numeric address into a text string suitable for presentation. The *af* argument shall specify the family of the address. This can be AF_INET or AF_INET6. The *src* argument points to a buffer holding an IPv4 address if the *af* argument is AF_INET, or an IPv6 address if the *af* argument is AF_INET6. The *dst* argument points to a buffer where the function stores the resulting text string; it shall not be NULL. The *size* argument specifies the size of this buffer, which shall be large enough to hold the text string (INET_ADDRSTRLEN characters for IPv4, INET6_ADDRSTRLEN characters for IPv6).

The *inet_pton*( ) function shall convert an address in its standard text presentation form into its numeric binary form. The *af* argument shall specify the family of the address. The AF_INET and AF_INET6 address families shall be supported. The *src* argument points to the string being passed in. The *dst* argument points to a buffer into which the function stores the numeric address; this shall be large enough to hold the numeric address (32 bits for AF_INET, 128 bits for AF_INET6).

If the *af* argument of *inet_pton*( ) is AF_INET, the *src* string shall be in the standard IPv4 dotted-decimal form:

```
ddd.ddd.ddd.ddd
```

where `"ddd"` is a one to three digit decimal number between 0 and 255 (see *inet_addr*( )). The *inet_pton*( ) function does not accept other formats (such as the octal numbers, hexadecimal numbers, and fewer than four numbers that *inet_addr*( ) accepts).

If the *af* argument of *inet_pton*( ) is AF_INET6, the *src* string shall be in one of the following standard IPv6 text forms:

1. The preferred form is `"x:x:x:x:x:x:x:x"`, where the `'x'`s are the hexadecimal values of the eight 16-bit pieces of the address. Leading zeros in individual fields can be omitted, but there shall be at least one numeral in every field.
2. A string of contiguous zero fields in the preferred form can be shown as `"::"`. The `"::"` can only appear once in an address. Unspecified addresses (`"0:0:0:0:0:0:0:0"`) may be represented simply as `"::"`.
3. A third form that is sometimes more convenient when dealing with a mixed environment of IPv4 and IPv6 nodes is `"x:x:x:x:x:x:d.d.d.d"`, where the `'x'`s are the hexadecimal values of the six high-order 16-bit pieces of the address, and the `'d'`s are the decimal values of the four low-order 8-bit pieces of the address (standard IPv4 representation).

Note: A more extensive description of the standard representations of IPv6 addresses can be found in RFC 2373.

RETURN VALUE

The *inet_ntop*( ) function shall return a pointer to the buffer containing the text string if the conversion succeeds, and NULL otherwise, and set *errno* to indicate the error.

The *inet_pton*( ) function shall return 1 if the conversion succeeds, with the address pointed to by *dst* in network byte order. It shall return 0 if the input is not a valid IPv4 dotted-decimal string IP6 or a valid IPv6 address string, or −1 with *errno* set to [EAFNOSUPPORT] if the *af* argument is unknown.

ERRORS

The *inet_ntop*( ) and *inet_pton*( ) functions shall fail if:

[EAFNOSUPPORT]	The *af* argument is invalid.
[ENOSPC]	The size of the *inet_ntop*( ) result buffer is inadequate.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The Base Definitions volume of IEEE Std 1003.1-200x, **<arpa/inet.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

IPv6 extensions are marked.

The **restrict** keyword is added to the *inet_ntop*( ) and *inet_pton*( ) prototypes for alignment with the ISO / IEC 9899: 1999 standard.

NAME

initstate, random, setstate, srandom — pseudo-random number functions

SYNOPSIS

XSI

```
#include <stdlib.h>

char *initstate(unsigned seed, char *state, size_t size);
long random(void);
char *setstate(const char *state);
void srandom(unsigned seed);

```

DESCRIPTION

The *random*( ) function shall use a non-linear additive feedback random-number generator employing a default state array size of 31 **long** integers to return successive pseudo-random numbers in the range from 0 to $2^{31}-1$. The period of this random-number generator is approximately 16 x ($2^{31}-1$). The size of the state array determines the period of the random-number generator. Increasing the state array size shall increase the period.

With 256 bytes of state information, the period of the random-number generator shall be greater than 2^{69}.

Like *rand*( ), *random*( ) shall produce by default a sequence of numbers that can be duplicated by calling *srandom*( ) with 1 as the seed.

The *srandom*( ) function shall initialize the current state array using the value of *seed*.

The *initstate*( ) and *setstate*( ) functions handle restarting and changing random-number generators. The *initstate*( ) function allows a state array, pointed to by the *state* argument, to be initialized for future use. The *size* argument, which specifies the size in bytes of the state array, shall be used by *initstate*( ) to decide what type of random-number generator to use; the larger the state array, the more random the numbers. Values for the amount of state information are 8, 32, 64, 128, and 256 bytes. Other values greater than 8 bytes are rounded down to the nearest one of these values. If *initstate*( ) is called with $8 \leq size < 32$, then *random*( ) shall use a simple linear congruential random number generator. The *seed* argument specifies a starting point for the random-number sequence and provides for restarting at the same point. The *initstate*( ) function shall return a pointer to the previous state information array.

If *initstate*( ) has not been called, then *random*( ) shall behave as though *initstate*( ) had been called with *seed*=1 and *size*=128.

Once a state has been initialized, *setstate*( ) allows switching between state arrays. The array defined by the *state* argument shall be used for further random-number generation until *initstate*( ) is called or *setstate*( ) is called again. The *setstate*( ) function shall return a pointer to the previous state array.

RETURN VALUE

If *initstate*( ) is called with *size* less than 8, it shall return NULL.

The *random*( ) function shall return the generated pseudo-random number.

The *srandom*( ) function shall not return a value.

Upon successful completion, *initstate*( ) and *setstate*( ) shall return a pointer to the previous state array; otherwise, a null pointer shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

After initialization, a state array can be restarted at a different point in one of two ways:

1. The *initstate*( ) function can be used, with the desired seed, state array, and size of the array.
2. The *setstate*( ) function, with the desired state, can be used, followed by *srandom*( ) with the desired seed. The advantage of using both of these functions is that the size of the state array does not have to be saved once it is initialized.

Although some implementations of *random*( ) have written messages to standard error, such implementations do not conform to this volume of IEEE Std 1003.1-200x.

Issue 5 restores the historical behavior of this function.

Threaded applications should use *rand_r*( ), *erand48*( ), *nrand48*( ), or *jrand48*( ) instead of *random*( ) when an independent random number sequence in multiple threads is required.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

drand48( ), *rand*( ), the Base Definitions volume of IEEE Std 1003.1-200x, **<stdlib.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

In the DESCRIPTION, the phrase ‘‘values smaller than 8’’ is replaced with ‘‘values greater than or equal to 8, or less than 32’’, ‘‘*size*<8’’ is replaced with ‘‘8≤*size* <32’’, and a new first paragraph is added to the RETURN VALUE section. A note is added to the APPLICATION USAGE indicating that these changes restore the historical behavior of the function.

Issue 6

In the DESCRIPTION, duplicate text ‘‘For values greater than or equal to 8 . . .’’ is removed.

NAME

insque, remque — insert or remove an element in a queue

SYNOPSIS

XSI

```
#include <search.h>

void insque(void *element, void *pred);
void remque(void *element);
```

DESCRIPTION

The *insque*( ) and *remque*( ) functions shall manipulate queues built from doubly-linked lists. The queue can be either circular or linear. An application using *insque*( ) or *remque*( ) shall ensure it defines a structure in which the first two members of the structure are pointers to the same type of structure, and any further members are application-specific. The first member of the structure is a forward pointer to the next entry in the queue. The second member is a backward pointer to the previous entry in the queue. If the queue is linear, the queue is terminated with null pointers. The names of the structure and of the pointer members are not subject to any special restriction. |

The *insque*( ) function shall insert the element pointed to by *element* into a queue immediately after the element pointed to by *pred*. |

The *remque*( ) function shall remove the element pointed to by *element* from a queue. |

If the queue is to be used as a linear list, invoking *insque*(&*element*, NULL), where *element* is the initial element of the queue, shall initialize the forward and backward pointers of *element* to null pointers.

If the queue is to be used as a circular list, the application shall ensure it initializes the forward pointer and the backward pointer of the initial element of the queue to the element's own address.

RETURN VALUE

The *insque*( ) and *remque*( ) functions do not return a value.

ERRORS

No errors are defined.

EXAMPLES

Creating a Linear Linked List

The following example creates a linear linked list.

```
#include <search.h>
...
struct myque element1;
struct myque element2;

char *data1 = "DATA1";
char *data2 = "DATA2";
...
element1.data = data1;
element2.data = data2;

insque (&element1, NULL);
insque (&element2, &element1);
```

Creating a Circular Linked List

The following example creates a circular linked list.

```
#include <search.h>
...
struct myque element1;
struct myque element2;

char *data1 = "DATA1";
char *data2 = "DATA2";
...
element1.data = data1;
element2.data = data2;

element1.fwd = &element1;
element1.bck = &element1;

insque (&element2, &element1);
```

Removing an Element

The following example removes the element pointed to by *element1*.

```
#include <search.h>
...
struct myque element1;
...
remque (&element1);
```

APPLICATION USAGE

The historical implementations of these functions described the arguments as being of type **struct qelem** * rather than as being of type **void** * as defined here. In those implementations, **struct qelem** was commonly defined in **<search.h>** as:

```
struct qelem {
    struct qelem  *q_forw;
    struct qelem  *q_back;
};
```

Applications using these functions, however, were never able to use this structure directly since it provided no room for the actual data contained in the elements. Most applications defined structures that contained the two pointers as the initial elements and also provided space for, or pointers to, the object's data. Applications that used these functions to update more than one type of table also had the problem of specifying two or more different structures with the same name, if they literally used **struct qelem** as specified.

As described here, the implementations were actually expecting a structure type where the first two members were forward and backward pointers to structures. With C compilers that didn't provide function prototypes, applications used structures as specified in the DESCRIPTION above and the compiler did what the application expected.

If this method had been carried forward with an ISO C standard compiler and the historical function prototype, most applications would have to be modified to cast pointers to the structures actually used to be pointers to **struct qelem** to avoid compilation warnings. By specifying **void** * as the argument type, applications do not need to change (unless they specifically referenced **struct qelem** and depended on it being defined in **<search.h>**).

RATIONALE

None.

FUTURE DIRECTIONS

None.

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

NAME

ioctl — control a STREAMS device (**STREAMS**)

SYNOPSIS

XSR

```
#include <stropts.h>

int ioctl(int fildes, int request, ... /* arg */);
```

DESCRIPTION

The *ioctl*( ) function shall perform a variety of control functions on STREAMS devices. For non-STREAMS devices, the functions performed by this call are unspecified. The *request* argument and an optional third argument (with varying type) shall be passed to and interpreted by the appropriate part of the STREAM associated with *fildes*.

The *fildes* argument is an open file descriptor that refers to a device.

The *request* argument selects the control function to be performed and shall depend on the STREAMS device being addressed.

The *arg* argument represents additional information that is needed by this specific STREAMS device to perform the requested function. The type of *arg* depends upon the particular control request, but it shall be either an integer or a pointer to a device-specific data structure.

The *ioctl*( ) commands applicable to STREAMS, their arguments, and error conditions that apply to each individual command are described below.

The following *ioctl*( ) commands, with error values indicated, are applicable to all STREAMS files:

I_PUSH Pushes the module whose name is pointed to by *arg* onto the top of the current STREAM, just below the STREAM head. It then calls the *open*( ) function of the newly-pushed module.

The *ioctl*( ) function with the I_PUSH command shall fail if:

[EINVAL]	Invalid module name.
[ENXIO]	Open function of new module failed.
[ENXIO]	Hangup received on *fildes*.

I_POP Removes the module just below the STREAM head of the STREAM pointed to by *fildes*. The *arg* argument should be 0 in an I_POP request.

The *ioctl*( ) function with the I_POP command shall fail if:

[EINVAL]	No module present in the STREAM.
[ENXIO]	Hangup received on *fildes*.

I_LOOK Retrieves the name of the module just below the STREAM head of the STREAM pointed to by *fildes*, and places it in a character string pointed to by *arg*. The buffer pointed to by *arg* should be at least FMNAMESZ+1 bytes long, where FMNAMESZ is defined in **<stropts.h>**.

The *ioctl*( ) function with the I_LOOK command shall fail if:

[EINVAL]	No module present in the STREAM.

I_FLUSH Flushes read and/or write queues, depending on the value of *arg*. Valid *arg* values are:

FLUSHR	Flush all read queues.
FLUSHW	Flush all write queues.
FLUSHRW	Flush all read and all write queues.

The *ioctl*( ) function with the I_FLUSH command shall fail if:

[EINVAL]	Invalid *arg* value.
[EAGAIN] or [ENOSR]	Unable to allocate buffers for flush message.
[ENXIO]	Hangup received on *fildes*.

I_FLUSHBAND	Flushes a particular band of messages. The *arg* argument points to a **bandinfo** structure. The *bi_flag* member may be one of FLUSHR, FLUSHW, or FLUSHRW as described above. The *bi_pri* member determines the priority band to be flushed.
I_SETSIG	Requests that the STREAMS implementation send the SIGPOLL signal to the calling process when a particular event has occurred on the STREAM associated with *fildes*. I_SETSIG supports an asynchronous processing capability in STREAMS. The value of *arg* is a bitmask that specifies the events for which the process should be signaled. It is the bitwise-inclusive OR of any combination of the following constants:

S_RDNORM	A normal (priority band set to 0) message has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
S_RDBAND	A message with a non-zero priority band has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
S_INPUT	A message, other than a high-priority message, has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
S_HIPRI	A high-priority message is present on a STREAM head read queue. A signal shall be generated even if the message is of zero length.
S_OUTPUT	The write queue for normal data (priority band 0) just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) normal data downstream.
S_WRNORM	Equivalent to S_OUTPUT.
S_WRBAND	The write queue for a non-zero priority band just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) priority data downstream.
S_MSG	A STREAMS signal message that contains the SIGPOLL signal has reached the front of the STREAM head read queue.
S_ERROR	Notification of an error condition has reached the STREAM head.

S_HANGUP	Notification of a hangup has reached the STREAM head.
S_BANDURG	When used in conjunction with S_RDBAND, SIGURG is generated instead of SIGPOLL when a priority message reaches the front of the STREAM head read queue.

If *arg* is 0, the calling process shall be unregistered and shall not receive further SIGPOLL signals for the stream associated with *fildes*.

Processes that wish to receive SIGPOLL signals shall ensure that they explicitly register to receive them using I_SETSIG. If several processes register to receive this signal for the same event on the same STREAM, each process shall be signaled when the event occurs.

The *ioctl*( ) function with the I_SETSIG command shall fail if:

[EINVAL]	The value of *arg* is invalid.
[EINVAL]	The value of *arg* is 0 and the calling process is not registered to receive the SIGPOLL signal.
[EAGAIN]	There were insufficient resources to store the signal request.

I_GETSIG

Returns the events for which the calling process is currently registered to be sent a SIGPOLL signal. The events are returned as a bitmask in an **int** pointed to by *arg*, where the events are those specified in the description of I_SETSIG above.

The *ioctl*( ) function with the I_GETSIG command shall fail if:

[EINVAL]	Process is not registered to receive the SIGPOLL signal.

I_FIND

Compares the names of all modules currently present in the STREAM to the name pointed to by *arg*, and returns 1 if the named module is present in the STREAM, or returns 0 if the named module is not present.

The *ioctl*( ) function with the I_FIND command shall fail if:

[EINVAL]	*arg* does not contain a valid module name.

I_PEEK

Retrieves the information in the first message on the STREAM head read queue without taking the message off the queue. It is analogous to *getmsg*( ) except that this command does not remove the message from the queue. The *arg* argument points to a **strpeek** structure.

The application shall ensure that the *maxlen* member in the **ctlbuf** and **databuf strbuf** structures is set to the number of bytes of control information and/or data information, respectively, to retrieve. The *flags* member may be marked RS_HIPRI or 0, as described by *getmsg*( ). If the process sets *flags* to RS_HIPRI, for example, I_PEEK shall only look for a high-priority message on the STREAM head read queue.

I_PEEK returns 1 if a message was retrieved, and returns 0 if no message was found on the STREAM head read queue, or if the RS_HIPRI flag was set in *flags* and a high-priority message was not present on the STREAM head read queue. It does not wait for a message to arrive. On return, **ctlbuf** specifies information in the control buffer, **databuf** specifies information in the data buffer, and *flags* contains the value RS_HIPRI or 0.

I_SRDOPT

Sets the read mode using the value of the argument *arg*. Read modes are described in *read*( ). Valid *arg* flags are:

RNORM	Byte-stream mode, the default.
RMSGD	Message-discard mode.
RMSGN	Message-nondiscard mode.

The bitwise-inclusive OR of RMSGD and RMSGN shall return [EINVAL]. The bitwise-inclusive OR of RNORM and either RMSGD or RMSGN shall result in the other flag overriding RNORM which is the default.

In addition, treatment of control messages by the STREAM head may be changed by setting any of the following flags in *arg*:

RPROTNORM	Fail *read*( ) with [EBADMSG] if a message containing a control part is at the front of the STREAM head read queue.
RPROTDAT	Deliver the control part of a message as data when a process issues a *read*( ).
RPROTDIS	Discard the control part of a message, delivering any data portion, when a process issues a *read*( ).

The *ioctl*( ) function with the I_SRDOPT command shall fail if:

[EINVAL]	The *arg* argument is not valid.

I_GRDOPT Returns the current read mode setting as, described above, in an **int** pointed to by the argument *arg*. Read modes are described in *read*( ).

I_NREAD Counts the number of data bytes in the data part of the first message on the STREAM head read queue and places this value in the **int** pointed to by *arg*. The return value for the command shall be the number of messages on the STREAM head read queue. For example, if 0 is returned in *arg*, but the *ioctl*( ) return value is greater than 0, this indicates that a zero-length message is next on the queue.

I_FDINSERT Creates a message from specified buffer(s), adds information about another STREAM, and sends the message downstream. The message contains a control part and an optional data part. The data and control parts to be sent are distinguished by placement in separate buffers, as described below. The *arg* argument points to a **strfdinsert** structure.

The application shall ensure that the *len* member in the **ctlbuf strbuf** structure is set to the size of a **t_uscalar_t** plus the number of bytes of control information to be sent with the message. The *fildes* member specifies the file descriptor of the other STREAM, and the *offset* member, which must be suitably aligned for use as a **t_uscalar_t**, specifies the offset from the start of the control buffer where I_FDINSERT shall store a **t_uscalar_t** whose interpretation is specific to the STREAM end. The application shall ensure that the *len* member in the **databuf strbuf** structure is set to the number of bytes of data information to be sent with the message, or to 0 if no data part is to be sent.

The *flags* member specifies the type of message to be created. A normal message is created if *flags* is set to 0, and a high-priority message is created if *flags* is set to RS_HIPRI. For non-priority messages, I_FDINSERT shall block if the STREAM write queue is full due to internal flow control conditions. For priority messages, I_FDINSERT does not block on this condition. For non-priority messages, I_FDINSERT does not block when the write queue is full and O_NONBLOCK is set. Instead, it fails and sets *errno* to [EAGAIN].

I_FDINSERT also blocks, unless prevented by lack of internal resources, waiting for the availability of message blocks in the STREAM, regardless of priority or whether O_NONBLOCK has been specified. No partial message is sent.

The *ioctl*( ) function with the I_FDINSERT command shall fail if:

[EAGAIN] A non-priority message is specified, the O_NONBLOCK flag is set, and the STREAM write queue is full due to internal flow control conditions.

[EAGAIN] or [ENOSR]
Buffers cannot be allocated for the message that is to be created.

[EINVAL] One of the following:

— The *fildes* member of the **strfdinsert** structure is not a valid, open STREAM file descriptor.

— The size of a **t_uscalar_t** plus *offset* is greater than the *len* member for the buffer specified through **ctlbuf**.

— The *offset* member does not specify a properly-aligned location in the data buffer.

— An undefined value is stored in *flags*.

[ENXIO] Hangup received on the STREAM identified by either the *fildes* argument or the *fildes* member of the **strfdinsert** structure.

[ERANGE] The *len* member for the buffer specified through **databuf** does not fall within the range specified by the maximum and minimum packet sizes of the topmost STREAM module or the *len* member for the buffer specified through **databuf** is larger than the maximum configured size of the data part of a message; or the *len* member for the buffer specified through **ctlbuf** is larger than the maximum configured size of the control part of a message.

I_STR Constructs an internal STREAMS *ioctl*( ) message from the data pointed to by *arg*, and sends that message downstream.

This mechanism is provided to send *ioctl*( ) requests to downstream modules and drivers. It allows information to be sent with *ioctl*( ), and returns to the process any information sent upstream by the downstream recipient. I_STR shall block until the system responds with either a positive or negative acknowledgement message, or until the request times out after some period of time. If the request times out, it shall fail with *errno* set to [ETIME].

At most, one I_STR can be active on a STREAM. Further I_STR calls shall block until the active I_STR completes at the STREAM head. The default timeout interval for these requests is 15 seconds. The O_NONBLOCK flag has no effect on this call.

To send requests downstream, the application shall ensure that *arg* points to a **strioctl** structure.

The *ic_cmd* member is the internal *ioctl*( ) command intended for a downstream module or driver and *ic_timout* is the number of seconds (−1=infinite, 0=use implementation-defined timeout interval, >0=as specified) an I_STR request shall wait for acknowledgement before timing out. *ic_len* is the number of bytes in the data argument, and *ic_dp* is a pointer to the data argument. The *ic_len* member has two uses: on input, it contains the length of the data argument passed in, and on return from the command, it contains the number of bytes being returned to the process (the buffer pointed to by *ic_dp* should be large enough to contain the maximum amount of data that any module or the driver in the STREAM can return).

The STREAM head shall convert the information pointed to by the **strioctl** structure to an internal *ioctl*( ) command message and sends it downstream.

The *ioctl*( ) function with the I_STR command shall fail if:

[EAGAIN] or [ENOSR]
Unable to allocate buffers for the *ioctl*( ) message.

[EINVAL] The *ic_len* member is less than 0 or larger than the maximum configured size of the data part of a message, or *ic_timout* is less than −1.

[ENXIO] Hangup received on *fildes*.

[ETIME] A downstream *ioctl*( ) timed out before acknowledgement was received.

An I_STR can also fail while waiting for an acknowledgement if a message indicating an error or a hangup is received at the STREAM head. In addition, an error code can be returned in the positive or negative acknowledgement message, in the event the *ioctl*( ) command sent downstream fails. For these cases, I_STR shall fail with *errno* set to the value in the message.

I_SWROPT Sets the write mode using the value of the argument *arg*. Valid bit settings for *arg* are:

SNDZERO Send a zero-length message downstream when a *write*( ) of 0 bytes occurs. To not send a zero-length message when a *write*( ) of 0 bytes occurs, the application shall ensure that this bit is not set in *arg* (for example, *arg* would be set to 0).

The *ioctl*( ) function with the I_SWROPT command shall fail if:

[EINVAL] *arg* is not the above value.

I_GWROPT Returns the current write mode setting, as described above, in the **int** that is pointed to by the argument *arg*.

I_SENDFD Creates a new reference to the open file description associated with the file descriptor *arg*, and writes a message on the STREAMS-based pipe *fildes* containing this reference, together with the user ID and group ID of the calling process.

The *ioctl*( ) function with the I_SENDFD command shall fail if:

[EAGAIN] The sending STREAM is unable to allocate a message block to contain the file pointer; or the read queue of the receiving STREAM head is full and cannot accept the message sent by I_SENDFD.

[EBADF] The *arg* argument is not a valid, open file descriptor.

[EINVAL] The *fildes* argument is not connected to a STREAM pipe.

[ENXIO] Hangup received on *fildes*.

I_RECVFD Retrieves the reference to an open file description from a message written to a STREAMS-based pipe using the I_SENDFD command, and allocates a new file descriptor in the calling process that refers to this open file description. The *arg* argument is a pointer to a **strrecvfd** data structure as defined in **<stropts.h>**.

The *fd* member is a file descriptor. The *uid* and *gid* members are the effective user ID and effective group ID, respectively, of the sending process.

If O_NONBLOCK is not set, I_RECVFD shall block until a message is present at the STREAM head. If O_NONBLOCK is set, I_RECVFD shall fail with *errno* set to [EAGAIN] if no message is present at the STREAM head.

If the message at the STREAM head is a message sent by an I_SENDFD, a new file descriptor shall be allocated for the open file descriptor referenced in the message. The new file descriptor is placed in the *fd* member of the **strrecvfd** structure pointed to by *arg*.

The *ioctl*( ) function with the I_RECVFD command shall fail if:

[EAGAIN] A message is not present at the STREAM head read queue and the O_NONBLOCK flag is set.

[EBADMSG] The message at the STREAM head read queue is not a message containing a passed file descriptor.

[EMFILE] The process has the maximum number of file descriptors currently open that it is allowed.

[ENXIO] Hangup received on *fildes*.

I_LIST Allows the process to list all the module names on the STREAM, up to and including the topmost driver name. If *arg* is a null pointer, the return value shall be the number of modules, including the driver, that are on the STREAM pointed to by *fildes*. This lets the process allocate enough space for the module names. Otherwise, it should point to a **str_list** structure.

The *sl_nmods* member indicates the number of entries the process has allocated in the array. Upon return, the *sl_modlist* member of the **str_list** structure shall contain the list of module names, and the number of entries that have been filled into the *sl_modlist* array is found in the *sl_nmods* member (the number includes the number of modules including the driver). The return value from *ioctl*( ) shall be 0. The entries are filled in starting at the top of the STREAM and continuing downstream until either the end of the STREAM is reached, or the number of requested modules (*sl_nmods*) is satisfied.

The *ioctl*( ) function with the I_LIST command shall fail if:

[EINVAL] The *sl_nmods* member is less than 1.

[EAGAIN] or [ENOSR]
Unable to allocate buffers.

I_ATMARK Allows the process to see if the message at the head of the STREAM head read queue is marked by some module downstream. The *arg* argument determines how the checking is done when there may be multiple marked messages on the STREAM head read queue. It may take on the following values:

ANYMARK	Check if the message is marked.
LASTMARK	Check if the message is the last one marked on the queue.

The bitwise-inclusive OR of the flags ANYMARK and LASTMARK is permitted.

The return value shall be 1 if the mark condition is satisfied; otherwise, the value shall be 0.

The *ioctl*( ) function with the I_ATMARK command shall fail if:

[EINVAL] Invalid *arg* value.

I_CKBAND Checks if the message of a given priority band exists on the STREAM head read queue. This shall return 1 if a message of the given priority exists, 0 if no such message exists, or –1 on error. *arg* should be of type **int**.

The *ioctl*( ) function with the I_CKBAND command shall fail if:

[EINVAL] Invalid *arg* value.

I_GETBAND Returns the priority band of the first message on the STREAM head read queue in the integer referenced by *arg*.

The *ioctl*( ) function with the I_GETBAND command shall fail if:

[ENODATA] No message on the STREAM head read queue.

I_CANPUT Checks if a certain band is writable. *arg* is set to the priority band in question. The return value shall be 0 if the band is flow-controlled, 1 if the band is writable, or –1 on error.

The *ioctl*( ) function with the I_CANPUT command shall fail if:

[EINVAL] Invalid *arg* value.

I_SETCLTIME This request allows the process to set the time the STREAM head shall delay when a STREAM is closing and there is data on the write queues. Before closing each module or driver, if there is data on its write queue, the STREAM head shall delay for the specified amount of time to allow the data to drain. If, after the delay, data is still present, it shall be flushed. The *arg* argument is a pointer to an integer specifying the number of milliseconds to delay, rounded up to the nearest valid value. If I_SETCLTIME is not performed on a STREAM, an implementation-defined default timeout interval is used.

The *ioctl*( ) function with the I_SETCLTIME command shall fail if:

[EINVAL] Invalid *arg* value.

I_GETCLTIME Returns the close time delay in the integer pointed to by *arg*.

Multiplexed STREAMS Configurations

The following commands are used for connecting and disconnecting multiplexed STREAMS configurations. These commands use an implementation-defined default timeout interval.

I_LINK Connects two STREAMs, where *fildes* is the file descriptor of the STREAM connected to the multiplexing driver, and *arg* is the file descriptor of the STREAM connected to another driver. The STREAM designated by *arg* is connected below the multiplexing driver. I_LINK requires the multiplexing driver to send an acknowledgement message to the STREAM head regarding the connection. This call shall return a multiplexer ID number (an identifier used to disconnect the multiplexer; see I_UNLINK) on success, and −1 on failure.

The *ioctl*( ) function with the I_LINK command shall fail if:

[ENXIO] Hangup received on *fildes*.

[ETIME] Timeout before acknowledgement message was received at STREAM head.

[EAGAIN] or [ENOSR] Unable to allocate STREAMS storage to perform the I_LINK.

[EBADF] The *arg* argument is not a valid, open file descriptor.

[EINVAL] The *fildes* argument does not support multiplexing; or *arg* is not a STREAM or is already connected downstream from a multiplexer; or the specified I_LINK operation would connect the STREAM head in more than one place in the multiplexed STREAM.

An I_LINK can also fail while waiting for the multiplexing driver to acknowledge the request, if a message indicating an error or a hangup is received at the STREAM head of *fildes*. In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_LINK fails with *errno* set to the value in the message.

I_UNLINK Disconnects the two STREAMs specified by *fildes* and *arg*. *fildes* is the file descriptor of the STREAM connected to the multiplexing driver. The *arg* argument is the multiplexer ID number that was returned by the I_LINK *ioctl*( ) command when a STREAM was connected downstream from the multiplexing driver. If *arg* is MUXID_ALL, then all STREAMs that were connected to *fildes* shall be disconnected. As in I_LINK, this command requires acknowledgement.

The *ioctl*( ) function with the I_UNLINK command shall fail if:

[ENXIO] Hangup received on *fildes*.

[ETIME] Timeout before acknowledgement message was received at STREAM head.

[EAGAIN] or [ENOSR] Unable to allocate buffers for the acknowledgement message.

[EINVAL] Invalid multiplexer ID number.

An I_UNLINK can also fail while waiting for the multiplexing driver to acknowledge the request if a message indicating an error or a hangup is received at the STREAM head of *fildes*. In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_UNLINK shall fail with *errno* set to the value in the message.

I_PLINK Creates a *persistent connection* between two STREAMs, where *fildes* is the file descriptor of the STREAM connected to the multiplexing driver, and *arg* is the file descriptor of the STREAM connected to another driver. This call shall create a persistent connection which can exist even if the file descriptor *fildes* associated with the upper STREAM to the multiplexing driver is closed. The STREAM designated by *arg* gets connected via a persistent connection below the multiplexing driver. I_PLINK requires the multiplexing driver to send an acknowledgement message to the STREAM head. This call shall return a multiplexer ID number (an identifier that may be used to disconnect the multiplexer; see I_PUNLINK) on success, and –1 on failure.

The *ioctl*( ) function with the I_PLINK command shall fail if:

[ENXIO] Hangup received on *fildes*.

[ETIME] Timeout before acknowledgement message was received at STREAM head.

[EAGAIN] or [ENOSR]
Unable to allocate STREAMS storage to perform the I_PLINK.

[EBADF] The *arg* argument is not a valid, open file descriptor.

[EINVAL] The *fildes* argument does not support multiplexing; or *arg* is not a STREAM or is already connected downstream from a multiplexer; or the specified I_PLINK operation would connect the STREAM head in more than one place in the multiplexed STREAM.

An I_PLINK can also fail while waiting for the multiplexing driver to acknowledge the request, if a message indicating an error or a hangup is received at the STREAM head of *fildes*. In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_PLINK shall fail with *errno* set to the value in the message.

I_PUNLINK Disconnects the two STREAMs specified by *fildes* and *arg* from a persistent connection. The *fildes* argument is the file descriptor of the STREAM connected to the multiplexing driver. The *arg* argument is the multiplexer ID number that was returned by the I_PLINK *ioctl*( ) command when a STREAM was connected downstream from the multiplexing driver. If *arg* is MUXID_ALL, then all STREAMs which are persistent connections to *fildes* shall be disconnected. As in I_PLINK, this command requires the multiplexing driver to acknowledge the request.

The *ioctl*( ) function with the I_PUNLINK command shall fail if:

[ENXIO] Hangup received on *fildes*.

[ETIME] Timeout before acknowledgement message was received at STREAM head.

[EAGAIN] or [ENOSR]	Unable to allocate buffers for the acknowledgement message.
[EINVAL]	Invalid multiplexer ID number.

An I_PUNLINK can also fail while waiting for the multiplexing driver to acknowledge the request if a message indicating an error or a hangup is received at the STREAM head of *fildes*. In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_PUNLINK shall fail with *errno* set to the value in the message.

RETURN VALUE

Upon successful completion, *ioctl*( ) shall return a value other than −1 that depends upon the STREAMS device control function. Otherwise, it shall return −1 and set *errno* to indicate the error.

ERRORS

Under the following general conditions, *ioctl*( ) shall fail if:

[EBADF]	The *fildes* argument is not a valid open file descriptor.
[EINTR]	A signal was caught during the *ioctl*( ) operation.
[EINVAL]	The STREAM or multiplexer referenced by *fildes* is linked (directly or indirectly) downstream from a multiplexer.

If an underlying device driver detects an error, then *ioctl*( ) shall fail if:

[EINVAL]	The *request* or *arg* argument is not valid for this device.
[EIO]	Some physical I/O error has occurred.
[ENOTTY]	The *fildes* argument is not associated with a STREAMS device that accepts control functions.
[ENXIO]	The *request* and *arg* arguments are valid for this device driver, but the service requested cannot be performed on this particular sub-device.
[ENODEV]	The *fildes* argument refers to a valid STREAMS device, but the corresponding device driver does not support the *ioctl*( ) function.

If a STREAM is connected downstream from a multiplexer, any *ioctl*( ) command except I_UNLINK and I_PUNLINK shall set *errno* to [EINVAL].

EXAMPLES

None.

APPLICATION USAGE

The implementation-defined timeout interval for STREAMS has historically been 15 seconds.

RATIONALE

None.

FUTURE DIRECTIONS

None.

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The Open Group Corrigendum U028/4 is applied, correcting text in the I_FDINSERT, [EINVAL] case to refer to *ctlbuf*.

This function is marked as part of the XSI STREAMS Option Group.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

NAME

isalnum — test for an alphanumeric character

SYNOPSIS

```
#include <ctype.h>

int isalnum(int c);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *isalnum*( ) function shall test whether *c* is a character of class **alpha** or **digit** in the program's current locale; see the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 7, Locale. |

The *c* argument is an **int**, the value of which the application shall ensure is representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined. |

RETURN VALUE

The *isalnum*( ) function shall return non-zero if *c* is an alphanumeric character; otherwise, it shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only this function and those listed in the SEE ALSO section should be used for character classification.

NAME

isalpha — test for an alphabetic character

SYNOPSIS

```
#include <ctype.h>

int isalpha(int c);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *isalpha*( ) function shall test whether *c* is a character of class **alpha** in the program's current locale; see the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 7, Locale.

The *c* argument is an **int**, the value of which the application shall ensure is representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

The *isalpha*( ) function shall return non-zero if *c* is an alphabetic character; otherwise, it shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only this function and those listed in the SEE ALSO section should be used for character classification.

RATIONALE

NAME

isascii — test for a 7-bit US-ASCII character

SYNOPSIS

XSI

```
#include <ctype.h>

int isascii(int c);
```

DESCRIPTION

The *isascii*( ) function shall test whether *c* is a 7-bit US-ASCII character code.

The *isascii*( ) function is defined on all integer values.

RETURN VALUE

The *isascii*( ) function shall return non-zero if *c* is a 7-bit US-ASCII character code between 0 and octal 0177 inclusive; otherwise, it shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

NAME

isastream — test a file descriptor (**STREAMS**)

SYNOPSIS

XSR

```
#include <stropts.h>

int isastream(int fildes);
```

DESCRIPTION

The *isastream*( ) function shall test whether *fildes*, an open file descriptor, is associated with a STREAMS-based file.

RETURN VALUE

Upon successful completion, *isastream*( ) shall return 1 if *fildes* refers to a STREAMS-based file and 0 if not. Otherwise, *isastream*( ) shall return −1 and set *errno* to indicate the error.

ERRORS

The *isastream*( ) function shall fail if:

[EBADF]	The *fildes* argument is not a valid open file descriptor.

EXAMPLES

None.

APPLICATION USAGE

None.

NAME

isatty — test for a terminal device

SYNOPSIS

```
#include <unistd.h>

int isatty(int fildes);
```

DESCRIPTION

The *isatty*( ) function shall test whether *fildes*, an open file descriptor, is associated with a terminal device.

RETURN VALUE

The *isatty*( ) function shall return 1 if *fildes* is associated with a terminal; otherwise, it shall return 0 and may set *errno* to indicate the error.

ERRORS

The *isatty*( ) function may fail if:

[EBADF]	The *fildes* argument is not a valid open file descriptor.
[ENOTTY]	The *fildes* argument is not associated with a terminal.

EXAMPLES

None.

APPLICATION USAGE

The *isatty*( ) function does not necessarily indicate that a human being is available for interaction via *fildes*. It is quite possible that non-terminal devices are connected to the communications line.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

The Base Definitions volume of IEEE Std 1003.1-200x, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The optional setting of *errno* to indicate an error is added.
- The [EBADF] and [ENOTTY] optional error conditions are added.

NAME

isblank — test for a blank character

SYNOPSIS

```
#include <ctype.h>

int isblank(int c);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *isblank*( ) function shall test whether *c* is a character of class **blank** in the program's current locale; see the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 7, Locale.

The *c* argument is a type **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined. |

RETURN VALUE

The *isblank*( ) function shall return non-zero if *c* is a <blank>; otherwise, it shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only this function and those listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

NAME

isfinite — test for finite value

SYNOPSIS

```
#include <math.h>

int isfinite(real-floating x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *isfinite*( ) macro shall determine whether its argument has a finite value (zero, subnormal, or normal, and not infinite or NaN). First, an argument represented in a format wider than its semantic type is converted to its semantic type. Then determination is based on the type of the argument.

RETURN VALUE

The *isfinite*( ) macro shall return a non-zero value if and only if its argument has a finite value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

NAME

isgraph — test for a visible character

SYNOPSIS

```
#include <ctype.h>

int isgraph(int c);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *isgraph*( ) function shall test whether *c* is a character of class **graph** in the program's current locale; see the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 7, Locale.

The *c* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined. |

RETURN VALUE

The *isgraph*( ) function shall return non-zero if *c* is a character with a visible representation; otherwise, it shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only this function and those listed in the SEE ALSO section should be used for character classification.

RATIONALE

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

NAME

isgreater — test if x greater than y

SYNOPSIS

```
#include <math.h>

int isgreater(real-floating x, real-floating y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *isgreater*( ) macro shall determine whether its first argument is greater than its second argument. The value of *isgreater*(x, y) shall be equal to $(x) > (y)$; however, unlike $(x) > (y)$, *isgreater*(x, y) shall not raise the invalid floating-point exception when x and y are unordered.

RETURN VALUE

Upon successful completion, the *isgreater*( ) macro shall return the value of $(x) > (y)$.

If x or y is NaN, 0 shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The relational and equality operators support the usual mathematical relationships between numeric values. For any ordered pair of numeric values, exactly one of the relationships (less, greater, and equal) is true. Relational operators may raise the invalid floating-point exception when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the unordered relationship is true. This macro is a quiet (non-floating-point exception raising) version of a relational operator. It facilitates writing efficient code that accounts for NaNs without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating** indicates that the argument shall be an expression of **real-floating** type.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

isgreaterequal( ), *isless*( ), *islessequal*( ), *islessgreater*( ), *isunordered*( ), the Base Definitions volume of IEEE Std 1003.1-200x **<math.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

isgreaterequal — test if x greater than or equal to y

SYNOPSIS

```
#include <math.h>

int isgreaterequal(real-floating x, real-floating y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *isgreaterequal*( ) macro shall determine whether its first argument is greater than or equal to its second argument. The value of *isgreaterequal*(*x*, *y*) shall be equal to (*x*) >= (*y*); however, unlike (*x*) >= (*y*), *isgreaterequal*(*x*, *y*) shall not raise the invalid floating-point exception when *x* and *y* are unordered.

RETURN VALUE

Upon successful completion, the *isgreaterequal*( ) macro shall return the value of (*x*) >= (*y*).

If *x* or *y* is NaN, 0 shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The relational and equality operators support the usual mathematical relationships between numeric values. For any ordered pair of numeric values, exactly one of the relationships (less, greater, and equal) is true. NAME

islower — test for a lowercase letter

SYNOPSIS

```
#include <ctype.h>

int islower(int c);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *islower*( ) function shall test whether *c* is a character of class **lower** in the program's current locale; see the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 7, Locale.

The *c* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined. |

RETURN VALUE

The *islower*( ) function shall return non-zero if *c* is a lowercase letter; otherwise, it shall return 0.

ERRORS

No errors are defined.

EXAMPLES

Testing for a Lowercase Letter

The following example tests whether the value is a lowercase letter, based on the locale of the user, then uses it as part of a key value.

```
#include <ctype.h>
#include <stdlib.h>
#include <locale.h>
...
char *keystr;
int elementlen, len;
char c;
...
setlocale(LC_ALL, "");
...
len = 0;
while (len < elementlen) {
    c = (char) (rand() % 256);
...
    if (islower(c))
        keystr[len++] = c;
    }
...
```

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The DESCRIPTION is updated to avoid use of the term ''must'' for application requirements.

NAME

isunordered — test if arguments are unordered

SYNOPSIS

```
#include <math.h>

int isunordered(real-floating x, real-floating y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *isunordered*( ) macro shall determine whether its arguments are unordered.

RETURN VALUE

Upon successful completion, the *isunordered*( ) macro shall return 1 if its arguments are unordered, and 0 otherwise.

If *x* or *y* is NaN, 0 shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The relational and equality operators support the usual mathematical relationships between numeric values. For any ordered pair of numeric values, exactly one of the relationships (less, greater, and equal) is true. Relational operators may raise the invalid floating-point exception when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the unordered relationship is true. This macro is a quiet (non-floating-point exception raising) version of a relational operator. It facilitates writing efficient code that accounts for NaNs without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating** indicates that the argument shall be an expression of **real-floating** type.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

NAME

isupper — test for an uppercase letter

SYNOPSIS

```
#include <ctype.h>

int isupper(int c);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-200x defers to the ISO C standard.

The *isupper*( ) function shall test whether *c* is a character of class **upper** in the program's current locale; see the Base Definitions volume of IEEE Std 1003.1-200x, Chapter 7, Locale.

The *c* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined. |

RETURN VALUE

The *isupper*( ) function shall return non-zero if *c* is an uppercase letter; otherwise, it shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only this function and those listed in the SEE ALSO section should be used for character classification.
